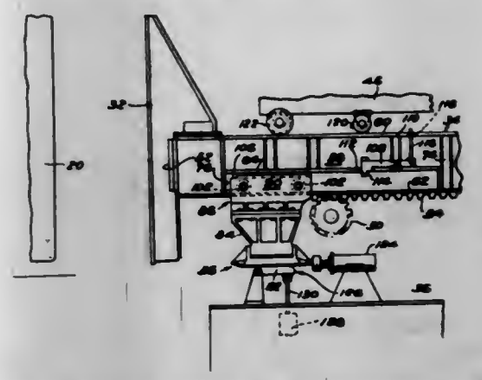
1. In an apparatus for receiving a plurality of codes and for generating a plurality of individual electrical signals corresponding to said codes, said apparatus comprising a plurality of relatively movable code receiving means with each of said receiving means carrying a plurality of members adapted to selectively retain said codes, a first station and actuating means located at said station for transferring said codes to said members, means for moving coded receiving means to a second station, means at said second station for holding said receiving means and for reading said codes, said reading means comprising a plurality of individual elements adapted to initiate operation of electrical circuits for generating said signals, said elements being located in a position corresponding to the positions of said members carried by said receiving means whereby said elements generate said signals depending upon which of said receiving means has been actuated to carry a code, and means for releasing said receiving means at said second station to effect reading of said codes, said holding means being adapted to hold a plurality of said receiving means and operating to release said receiving means one at a time for reading of said codes.



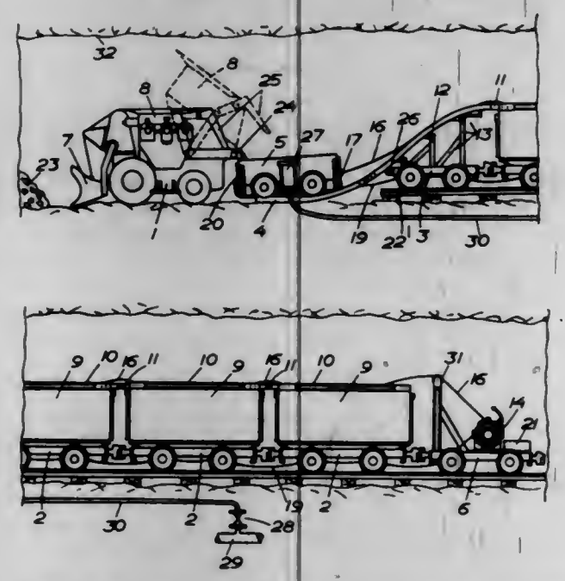
3,272,355
METHOD AND APPARATUS FOR UNLOADING SILAGE
Leo J. Loesch and Claude E. Loesch, both of Rte. 1, Kimball, Minn.
Filed Dec. 2, 1964, Ser. No. 418,370
15 Claims. (Cl. 214—17)

1. A silo unloader, comprising a frame; and silage collecting and discharging means journalled in said frame for rotation about the center of the silo, said means including a rotatable member extending radially outwardly from a location adjacent the center of the silo to a location adjacent the silo wall, angularly disposed blade means on said member, a hood substantially enclosing the upper portion of said rotatable member and having an outlet at its inner end, a motor, drive means interconnecting the motor and said rotatable member, said drive means having a drive ratio between the motor and the rotatable member in the range of 1:2 to 2:1 whereby said blade means rotates about the axis of the rotatable member with a peripheral speed in excess of 2000 feet per minute to dislodge the silage and convey the same to the center of the silo for discharge therefrom, and a discharge mechanism disposed at the inner end of the member and having an inlet connected to the outlet of said hood for receiving the dislodged silage and discharging it to the exterior of the silo.

8. A method of unloading silage from a silo, comprising the step of positioning an auger on the upper surface of the silage in a silo with the inner end of the auger located adjacent the center of the silo and the outer end of the auger located adjacent the wall of the silo, confining the upper portion of the auger with a hood, rotating the auger about the center of the silo, rotating the auger about its axis at a speed sufficient to provide the auger with a peripheral speed greater than 2000 feet per minute to dislodge the silage and propel the dislodged silage along the undersurface of the hood and convey the same to the center of the silo, and discharging the silage conveyed to the center of the silo to the exterior of said silo.

3,272,356
PUSHER MACHINE WITH MOVABLE RAM GIRDER SUPPORT SHOE
Frederick Lovetro, Glenshaw, Pa., assignor to Koppers Company, Inc., a corporation of Delaware
Filed Feb. 1, 1965, Ser. No. 429,453
11 Claims. (Cl. 214—23)

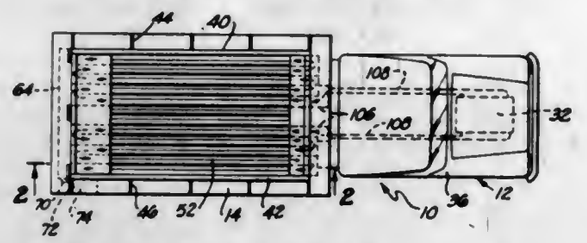
1. A pusher ram for pushing coke horizontally out of a coke oven chamber comprising:
- a support structure mounted on rails and arranged to be propelled along the pusher side of a coke oven battery having a plurality of laterally extending coke oven chambers,
- a ram girder mounted on said support structure for reciprocating movement relative thereto into and out of a coke oven chamber,
- a vertically extending ram head secured to the front end of said ram girder, said ram head arranged to contact said coke charge within said coke oven chamber and push said coke charge out of said coke oven chamber,
- drive means on said supporting structure for reciprocating said ram girder between a retracted position in which said ram head is located outside the coke oven chamber on the pusher side of the coke oven battery and an extended position in which the ram head extends beyond the coke oven chamber on the coke side and said ram girder is positioned within said coke oven chamber,
- a support shoe carried by said ram girder adjacent to said ram head, said support shoe arranged to slide on said coke oven chamber floor and support said ram



girder front end portion and said ram head within said coke oven chamber,

means slidably connecting said support shoe to said ram girder so that said support shoe is movable longitudinally relative to said ram girder a preselected distance,

lock means fixed to said support structure adjacent said drive means operable to fixedly secure said support shoe to said support structure adjacent said drive means and permit movement of said ram girder relative thereto, and



means on said ram girder operable to engage said support shoe to said ram girder at a preselected position on said ram girder for movement of said support shoe with said ram girder.

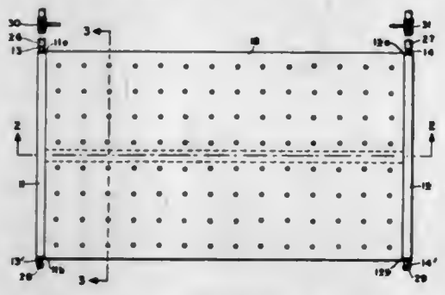
3,272,357
LOADING AND TRANSPORTATION EQUIPMENT
Letterio Freni, Montevecchio, Cagliari, Italy, assignor to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed July 8, 1964, Ser. No. 381,005
4 Claims. (Cl. 214—41)

1. A loading and transportation equipment comprising, a plurality of cars adapted to be filled with material, couplings connecting the cars to form a train, side walls on the cars, rail elements associated with said side walls to form a track portion for each car, connecting means for joining the track portions of adjacent cars to form a continuous track on the train, said connecting means comprising two first rail pieces guided for longitudinal movement a limited distance relative to the respective car side, two second rail pieces each constituting an extension of the first rail pieces and hingedly connected to said first rail pieces on horizontal hinge axes, and said second rail pieces of adjacent cars forming together a hinge with a vertical axis, a track ramp composed of a low horizontal track portion and an inclined track portion connecting the low track portion with the track portion on one of the cars to thereby form a continuous track from said low track portion to all of the connected track portions of the cars, a skip having wheels for movement along the connected tracks from a material-receiving position on the low track portion to a material-discharge position of any of the cars of the train, power means for moving the loaded skip along the connected track portions from said low material-receiving position to a discharge position of any of the cars of the train, and power-operated bottom-opening means on the skip adapted to enable material in the skip to be discharged into one of said cars of the train upon opening by said opening means.

3,272,358
TRUCK UNLOADING STRUCTURE
Fred Thompson, Anaheim, Calif., assignor of one-half to Donald J. Vlerstra
Filed Mar. 30, 1964, Ser. No. 355,612
3 Claims. (Cl. 214—83.2)

2. A vehicle, said vehicle comprising:

a frame, means connected to said frame to support said frame, means connected to said frame to propel and guide said frame and a body mounted on said frame;



said body comprising side walls, a front wall, a rear wall and a floor to define a load space adapted for the carrying of granular materials;

said floor comprising a plurality of ridges and valleys in side by side relationship and extending from said front wall to said rear wall substantially parallel to said side walls and extending in side by side relationship from one side to the other side;

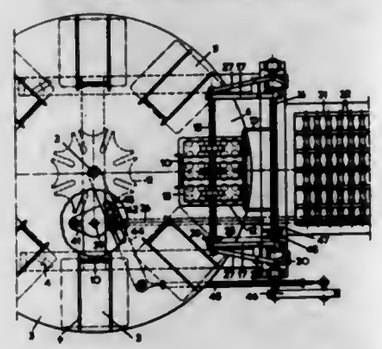
material flow control means positioned adjacent said floor to control the flow of granular materials into said valleys, said material flow control means comprising a plurality of ridges bridging one of said valleys and an angular member positioned on said ridges so as to restrict flow of material into said valley; and

a front roll and a rear roll mounted with respect to said floor adjacent the front and the rear, respectively, of said valleys, flexible units extending around said front roll and said rear roll and through said valleys so that upon rotation of said rolls said flexible units move through said valleys, and motor means to rotate at least one of said rolls.

3,272,359
METHOD FOR MATERIALS HANDLING
James H. Thomas, Green Township, and Robert V. Burt, Cincinnati, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed Apr. 28, 1964, Ser. No. 363,078
1 Claim. (Cl. 214—152)

The method of materials handling which comprises:

(A) positioning a thin, substantially imperforate web loosely on the upper surface of a pallet having air outlets on the upper and lower surfaces thereof, said outlets being separately controlled, and placing cargo to be shipped on said imperforate web, said cargo comprising a plurality of containers,

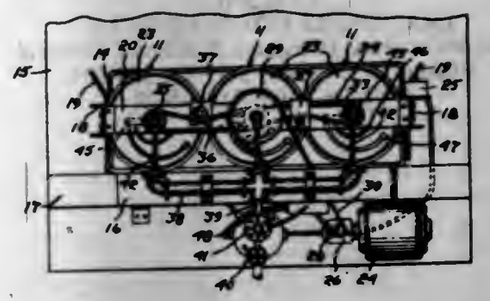


(B) connecting the lower air outlets to a source of pressurized air to thereby create an air cushion between the lower surface of the pallet and the floor,

(C) moving the loaded pallet to the required location at which the cargo is to be placed,

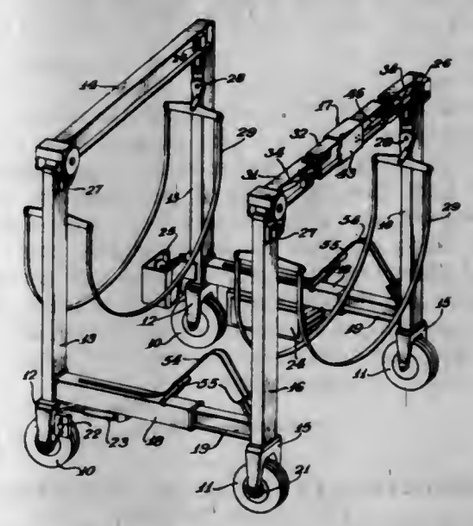
(D) connecting the upper air outlets to a source of pressurized air to thereby create an air cushion between the imperforate web underlying the cargo and the upper surface of the pallet while maintaining the air cushion between the lower surface of the pallet and the floor, and

(E) stripping the pallet from underneath the cargo while simultaneously maintaining said cargo in a substantially stationary position whereby said cargo is deposited at said location.



3,272,360
APPARATUS FOR FEEDING AN EGG-PROCESSING MACHINE
Jelle van der Schoot, Aalten, Netherlands, assignor to Van Katwijk's Industrieen N.V., Aalten, Netherlands
Filed Oct. 5, 1964, Ser. No. 401,304
8 Claims. (Cl. 214—309)

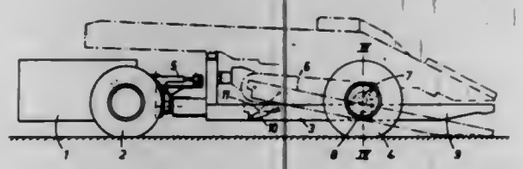
1. An apparatus for automatically feeding an egg-processing machine to which the eggs are supplied on plates each having a plurality of rows of egg seats comprising a plurality of conveyor belts corresponding with the number of rows of egg seats moved in mutually parallel relationship and each having a row of egg seats spaced along its length to convey the eggs to a processing station, the spacing between said conveyor belts exceeding that of the rows of egg seats on said plates, a turntable having a plurality of accommodating stations on each of which an egg plate may be placed, means restraining said plate from lateral displacement and from being lifted off said table, means for rotating said turntable intermittently so that each accommodating station will successively be halted at an emptying station for emptying a loaded egg plate, carrier means having vacuum-power operated suction cups mounted thereon in rows corresponding to the seats of said egg plates, means for moving said suction cups to a position over the egg plate at said emptying station to engage by vacuum-power the eggs carried by said plate and then moving said cups with eggs attached to a position over said conveyor belts to transfer the eggs to the seats on said belts, and means operable during this movement to spread the rows of suction cups with eggs attached to correspond with the spacing of said conveyor belts.



3,272,361
APPARATUS FOR USE IN FREEING BAKERY PRODUCTS FROM THEIR PANS
Leo G. Vogel, Falmouth Foreside, Maine, and Ralph J. Hursty, South Hamilton, Mass., assignors to V.H.K. Corporation, South Portland, Maine, a corporation of Maine
Filed Mar. 5, 1965, Ser. No. 437,399
17 Claims. (Cl. 214—310)

1. In apparatus for releasing a bakery product from the pan in which it was baked, a first support, air jet establishing means carried by said support, a source of air under pressure in communication with said jet establishing means, a second support, said second support being for the pan and positioning the pan with the seam defined by the junction of the side of the product and the side of the pan in the path of air delivered through said jet establishing means, and means connected to one of said supports and operable to turn it to effect relative movement between said jet establishing means and said pan for substantially the full length of said seam, the product

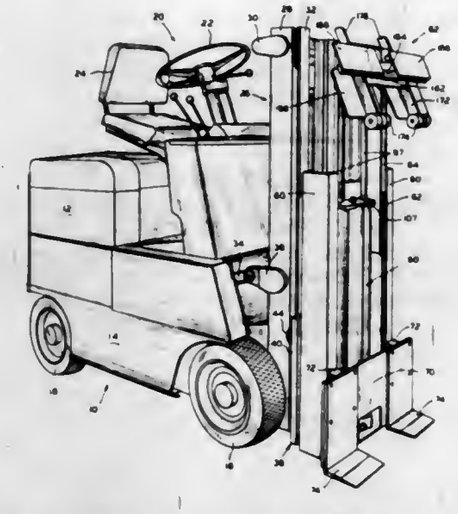
being sufficiently close to the jet establishing means and the pressure of the air delivered therethrough being such that the seam is opened on such relative movement and the product freed from the bottom of said pan at least when the full length of said seam has been exposed to the jet establishing means.



3,272,362
BOAT HOIST APPARATUS
Gerald P. Lamer and Elliott S. Burdick, Wausau, Wis., assignors to Drott Manufacturing Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed Nov. 2, 1964, Ser. No. 408,195
5 Claims. (Cl. 214—396)

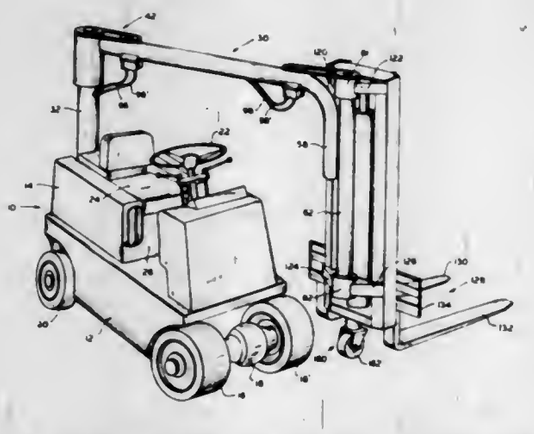
1. A boat hoist apparatus comprising a pair of spaced parallel frame side members, wheels supporting the side members for movement over the ground, a fixed gantry carried by the side members adjacent to one end thereof and including a pair of upright columns connected by a top beam, hoist devices carried by the gantry adjacent to the juncture of the columns and top beam, a pair of upright columns connected to the side members respectively adjacent to the other ends thereof, hoist devices carried by the last named columns at their upper ends, a pair of gate members hingedly connected to the upper ends of the last named columns respectively for swinging from an aligned closed position spanning the space between the columns to an open position, power means controllable from a remote point connected to the gate members to swing them, a sleeve slidably mounted on one of the gate members and slidable over the end of the other gate member to hold the gate members in aligned position, power means controllable from a remote point to

slide the sleeve, cooperating latch parts on the sleeve and said other gate member to latch the sleeve against movement, and power means controllable from a remote point to disengage the latch parts so that the sleeve can be slid.



3,272,363
TRANSPORTATION VEHICLE
Åke Malmgren, Tvargatan 5, Kiruna, Sweden
Filed Oct. 29, 1963, Ser. No. 319,870
1 Claim. (Cl. 214—505)

In a vehicle especially for the transportation of wheeled loads in narrow passages comprising in combination, a power vehicle having a single pair of wheels, a trailer having likewise a single pair of wheels, and a controllable link connection for steerably coupling the trailer to the power vehicle, said trailer being provided with a U-shaped rigid frame member having its open end facing rearwardly and a movable frame member swingable about a transverse axis between a normal position on a level with the rigid frame member in which position it is surrounded on three of its sides by said rigid frame member so as to form a bottom therein and a rearwardly inclined position, said bottom member having a pair of rearwardly extending arms to act as a ramp for the wheeled load in the rearwardly swung position of the bottom member. bearings for the transverse shaft of the movable frame member as well as bearings for the wheel axles of the rigid frame member being provided at the free ends of the side portions of the rigid frame member, said transverse shaft of the movable frame member being positioned on a lower level than the axles of the wheels of the rigid frame member, said axles of the wheels of the rigid frame member being clamped in sleeves rigidly connected to the rigid frame member and carrying ball bearings for the wheels, and the shaft of the movable frame member being clamped by its ends into borings in the side portions of the rigid frame member, the movable frame member being pivotally mounted on said shaft.

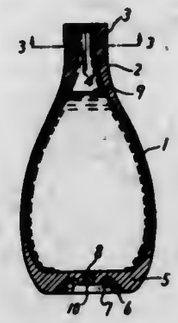


3,272,364
COMBINATION CLAMP-GRAB ATTACHMENT FOR LIFT TRUCK
Kenneth H. Mindrum, Battle Creek, and James H. Newhouse, East Leroy, Mich., assignors to Clark Equipment Company, a corporation of Michigan
Filed Dec. 13, 1963, Ser. No. 330,437
5 Claims. (Cl. 214—654)

2. An attachment for lift trucks having a first extensible mast assembly located adjacent one end thereof, comprising a second extensible mast assembly mounted for elevating movement in the first said assembly, first load engaging means mounted at the lower end of the second mast assembly, second load engaging means mounted near the upper end of said second mast assembly for movement vertically relative to the first load engaging means, and motor means mounted in said second mast assembly for raising and lowering the second load engaging means relative to the first load engaging means, means locating said second load engaging means normally in an inoperative position extending forwardly and diagonally relative to the first load engaging means, said second load engaging means being actuatable pivotally from said inoperative position to a first operative position in which said first and second load engaging means cooperate to clamp a load therebetween, and said second load engaging means being actuatable pivotally from said

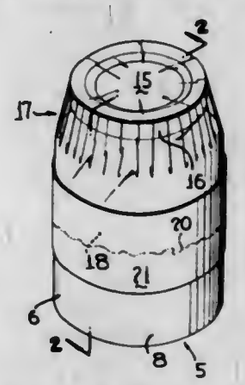
inoperative position to a second operative position in which said second load engaging means is operable alone to lift a load.

3,272,365
INDUSTRIAL LIFT TRUCK
Daryl W. Stevens, Battle Creek, Mich., assignor to Clark Equipment Company, a corporation of Michigan
Filed Dec. 3, 1963, Ser. No. 327,588
9 Claims. (Cl. 214—671)



9. A front and side loading truck, comprising a vehicle, a column secured at its lower end to said vehicle and projecting upwardly to a point above said vehicle, a horizontally positioned boom connected to the upper end of said column for slewing from side to side above said vehicle, an upright mounted on said boom, a means for pivotally connecting said upright on a vertical axis to the forward end of said boom, and a supporting means below said upright and turnable on a vertical axis for alignment with the direction of movement of said upright.

3,272,366
CONTAINER
Hideho Ikeda, Osaka-fu, Japan, assignor to Juzo Neya, Nada-ku, Japan
Filed May 13, 1965, Ser. No. 455,409
9 Claims. (Cl. 215—2)

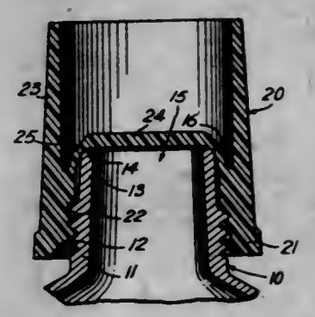


1. A hermetically sealed container comprising a main body and an elongated annular neck extending from said body, said neck having a relatively thick wall terminating in a sealed end portion and a peripheral groove

spaced from said sealed end portion to form a relatively thin wall portion, the last said wall portion being formed

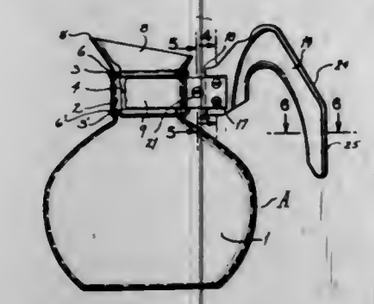
with at least two relatively sharp outwardly directed corner portions.

3,272,367
SEALED PACKAGE
Florren E. Long, La Grange, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed July 1, 1964, Ser. No. 379,675
5 Claims. (Cl. 215—38)



1. A tamper-proof sealed package comprising a container having a body terminating at one end portion in a bottom wall, a second end portion of said body having a neck defining an opening of said container, a closure, means removably securing said closure to said neck to close said opening, a sheet material seal drawn over said closure, said sheet material seal having a lower edge portion terminating in a selvage edge upwardly from said bottom wall and below said neck, a label wholly covering said selvage edge and a portion of said body adjacent said selvage edge, said label having a lower edge terminating above said bottom wall, and means located between said body and said label for positively securing said label to at least said adjacent body portion.

3,272,368
PLASTIC STOPPER WITH GUARANTEE STRIP
Paul S. Van Baarn, 8 Rue Bellevue, Monte Carlo, Monaco
Filed Oct. 20, 1964, Ser. No. 405,297
3 Claims. (Cl. 215—41)

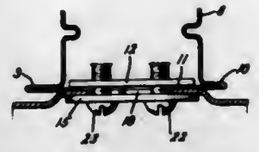


1. A plastic stopper device for releasably sealing the orifice in the neck of a container comprising a lower belt portion for securing said stopper device to said neck of the container, a captive lid portion having an outer skirt including bead means for sealing said orifice, at least one hinge strap integrally formed with said belt portion and said lid portion interconnecting same for movement of said lid portion about a hingle point between a sealing position parallel to said belt portion and an open position generally perpendicular thereto, a tear-off guarantee strip between said lower belt portion and said lid portion for precluding movement of said lid portion to said open position until said guarantee strip is torn off, and means on said belt portion and said lid portion for releasably holding said lid in its open position, said holding means comprising a pair of outer lugs extending outwardly from one of said portions on opposite sides of said hinge point, said lugs having projections extending from each lug toward the other forming a decreased spacing therebetween, said holding means further including an intermediate outer arm extending outwardly from the other of said portions at said hinge point, the outer end of said arm having a pair of ears extending sidewardly therefrom a distance greater than said decreased spacing, said arm being positioned to be engaged between said lugs when said lid is in its open position, said ears on said outer lugs and said projections on said intermediate outer arm resiliently engaging each other for opposing movement of said lid into its sealing position, said intermediate arm and said outer lugs being formed integrally with said belt portion, lid portion and guarantee tear strip of a resilient plastic material.

3,272,369
CONTAINER CLOSURE
Arvid Kjellsen Grimsley, Rockaway, N.J., assignor to American Can Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 7, 1964, Ser. No. 402,127
3 Claims. (Cl. 215—43)

1. A plastic screw cap for attachment to the cylindrical threaded neck of a container which is formed with a smooth cylindrical exterior side wall at its upper end which merges into a smooth transverse sealing lip wall to form a relatively sharp sealing corner extending 360° around the neck, said cap being made of a relatively soft, resilient plastic material and comprising a cylindrical wall having threads formed in its internal surfaces for engagement with the threads of the container neck, a transversely extending end wall disposed above said threads, and an upwardly and inwardly inclined resilient sealing wall thinner than and connecting said cylindrical wall and said transversely extending end wall, said sealing wall at its bottom end having an internal diameter greater than the external diameter of the upper end of the container neck and at its top end having an internal diameter smaller than the external diameter of the upper end of the container neck, said sealing wall being adapted to be engaged intermediate its top and bottom ends by the sealing corner of said container neck in a driving fit and to be indented under tension around the sealing corner of the neck and into sealing engagement with the cylindrical side wall of the container neck when the cap is seated on the container neck.

3,272,370
COMBINATION POURING LIP AND COLLAR CONSTRUCTION FOR LIQUID VESSELS
Walter A. Plagenberg, Berkeley, Mo., assignor to Star Coffee Company, St. Louis, Mo., a corporation of Missouri
Filed Apr. 20, 1964, Ser. No. 360,828
10 Claims. (Cl. 215—100)

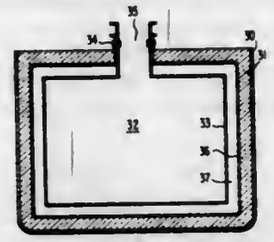


1. A liquid vessel construction comprising a vessel having a bowl and a neck, a collar detachably disposed about said neck, a pouring lip integral with said collar and projecting beyond the upper end of said neck, cooperating means provided on said collar and said neck for interengagement, said means comprising at least one laterally outwardly projecting bead provided on said neck and a complementary rib provided on said collar for embracingly receiving said bead, and a clamping member for retaining said collar securely upon said neck.

3,272,371
TUBE TRAY
Benjamin F. Weiner, North Bellmore, N.Y., assignor to Chase Instruments Corporation, Long Island City, N.Y., a corporation of New York
Filed Mar. 12, 1965, Ser. No. 439,249
6 Claims. (Cl. 217—26.5)

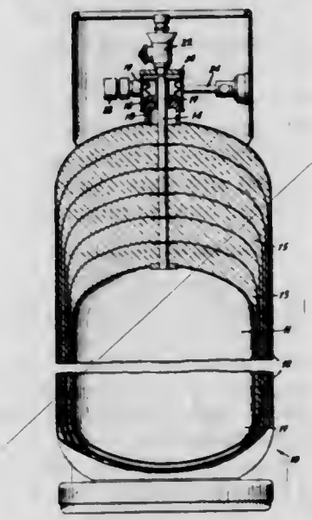
1. A tube tray consisting of a thin-walled body of substantially uniform thickness having an upper peripheral edge of rectangular configuration provided with a pair of elongated opposed substantially parallel sides and a pair of elongated opposed substantially parallel ends extending between said sides and being shorter than said sides, said body having a pair of opposed side walls extending down from said sides of said peripheral edge and having a bottom wall situated distant from said peripheral edge and extending between and connected to said side walls, said bottom wall having in a plane substantially parallel to and situated between said side walls a scalloped configuration providing said bottom wall with a row of upwardly directed elongated channels each extending between said side walls for receiving a tube therein, said channels having upwardly directed concave surfaces and downwardly directed convex surfaces, and said row of channels terminating at one end in an end channel connected directly to one of said ends of said peripheral edge of said body, said channels having, in a direction parallel to said sides of said peripheral edge, a substantially uniform width and said row of channels terminating distant from said one end of said peripheral edge in an end channel spaced from the other end of said peripheral edge by a distance approximately equal to one-half the width of each of said channels, and said bottom wall having between said other end of said peripheral edge of said body and the end channel adjacent thereto a bottom wall portion situated at an elevation higher than the lowermost portions of said channels.

3,272,372
BUSWAY PLUG ENCLOSURE WITH MOUNTING MEANS
Eric A. Ericson, Plainville, Conn., assignor to General Electric Company, a corporation of New York
Filed May 18, 1964, Ser. No. 368,122
5 Claims. (Cl. 220—3.9)



4. In combination:
(a) a busway having a housing provided with longitudinally extending flanges spaced apart to provide an opening extending longitudinally of said housing,
(b) an enclosure having a first wall adjacent to and facing the plane of said flanges and provided with a generally circular opening having opposing abutments extending radially toward each other to restrict said opening along a diameter thereof,
(c) said enclosure also having end walls provided with anti-turn tabs extending through the opening between said flanges,
(d) an oblong latch plate disposed outside said enclosure in parallel planar relationship with respect to said first wall and having a pair of spaced apart threaded holes extending therethrough perpendicular to the general plane thereof, the length of said latch plate being greater than the distance between said flanges and the width of said latch plate being less than the distance between said flanges,
(e) a washer disposed within said enclosure adjacent to said first wall and in parallel planar relationship therewith and having a pair of unthreaded holes in register with said threaded holes and having an aperture in the region between said unthreaded holes,
(f) a pair of screws passing through corresponding holes in said washer and through said opening in said first wall on opposite sides of said diameter through said abutments and each of said screws being threaded into a corresponding one of said threaded holes in said latch plate,
(g) said aperture in said washer providing for the insertion of a tool therethrough into endwise engagement and the endwise movement of said tool to move said latch plate through said opening between said flanges and to effect rotation of said washer and said latch plate between unlocked and locked limits defined by said abutments.

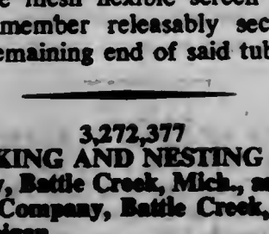
3,272,373
FLEXIBLE AND ELASTIC TANKS FOR TRANSPORTING LIQUIDS IN BULK
Jean Henri Alleaume, 121 Ave. du Marechal Foch, Saint-Cloud, Seine, France, and Denis Marcel Henri Hamel, 4 Ave. Victor Hugo, Saint-Maude, Seine, France
Filed Oct. 10, 1963, Ser. No. 315,329
Claims priority, application France, Oct. 10, 1962, 911,881
12 Claims. (Cl. 220—9)



1. A device for the transport of liquids in bulk comprising an outer wall, a thermally insulating layer disposed adjacent the inner surface of said outer wall and a double-walled container disposed within said thermally insulating

layer, said double-walled container consisting of spaced main and second tanks, each of said tanks being made of

a homogeneous and intrinsically flexible and elastic material.



3,272,374
DOUBLE-WALLED INSULATED CONTAINER
Paul E. Loveday, Tonawanda, and John A. Paivanas, Williamsville, N.Y., assignors to Union Carbide Corporation, a corporation of New York
Filed Jan. 3, 1964, Ser. No. 335,646
8 Claims. (Cl. 220—14)

2. A low-boiling liquefied gas container comprising an inner vessel for holding the liquefied gas; an outer shell surrounding said inner vessel and spaced therefrom so as to form an intervening vacuum space; a compressible composite multi-layered insulation comprised of a low conductive component and a radiant heat barrier component disposed within such space; a fluid conduit between said inner vessel and said outer shell for transporting such liquefied gas from the container; said fluid conduit comprising the sole vertical support for said inner vessel; a pivotal swivel joint surrounding said fluid conduit adjacent the point where said conduit passes through the top of said outer shell; a flexible gas-tight enclosure surrounding said pivotal swivel joint for sealing the insulation space from the inner vessel; and a protective pressure housing surrounding said flexible gas-tight enclosure for sealing the inner vessel from the pressure of the ambient atmosphere.

3,272,375
APPARATUS FOR CRYOGENIC LIQUID STORAGE CONTAINERS
Alexander H. Holcombe, Clarence, and Stanley R. Koch, Tonawanda, N.Y., assignors to Union Carbide Corporation, a corporation of New York
Continuation of application Ser. No. 120,584, June 29, 1961. This application Mar. 3, 1965, Ser. No. 445,297
9 Claims. (Cl. 220—15)

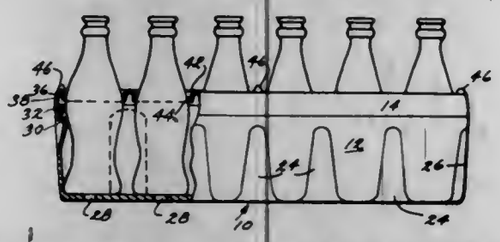
1. In combination with a double-walled cryogenic liquid storage container having a horizontally disposed longitudinal axis, an inner liquid product holding vessel, an outer shell surrounding the inner vessel and spaced to form an insulation space therebetween, and means for filling, discharging, and venting said inner vessel, the improvement which comprises inner vessel support means for the sole support of said inner vessel from said outer shell consisting of a plurality of inner vessel re-entrant tubes positioned in transverse planes substantially perpendicular to the longitudinal axis of the container, each extending radially through the longitudinal axis of said inner vessel and having a first end and a second end each

gas tightly sealed from the interior of said inner vessel and joined to the walls of said inner vessel, said first end being joined to the lower portion of the wall of said inner vessel and said second end being joined to the upper portion of the wall of said inner vessel such that the interior of each re-entrant tube is in gas communication with the insulation space; and a plurality of transversely positioned load rods, each extending into one of the re-entrant tubes through the said first end of such tube and having one end connected to said outer shell and the other end connected to an inner wall of such corresponding re-entrant tube.

3,272,376
INSECT CONTAINER
John L. Tierney and Andrea L. Tierney, both of 1021 El Camino Ave., Stockton 7, Calif.
Filed Nov. 15, 1963, Ser. No. 324,094
2 Claims. (Cl. 220—19)

1. A device of the character described comprising, a cup-shaped imperforate bottom member, a solid weighted portion rigidly secured in said cup-shaped member, a tubular member having its lower portion permanently embedded in said weighted portion with said cup-shaped member disposed in closing relation to the lower end of said tubular member, said tubular member being formed of a fine mesh flexible screen material, and a cup-shaped lid member releasably secured in closing relation to the remaining end of said tubular member.

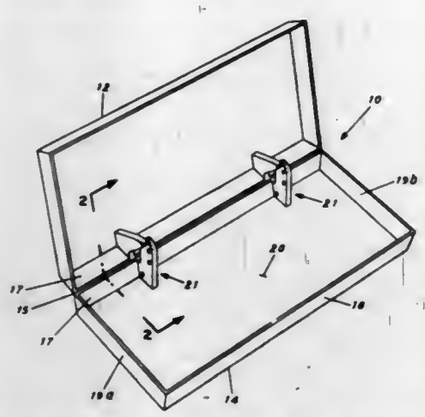
3,272,377
STACKING AND NESTING CASE
Walter H. Schray, Battle Creek, Mich., assignor to United Steel & Wire Company, Battle Creek, Mich., a corporation of Michigan
Filed Feb. 6, 1964, Ser. No. 342,886
5 Claims. (Cl. 220—19)



1. In a wire container of the character described, a lower bottom ring, an upper bottom ring, each of said rings being substantially square in conformation, pins connecting together two opposite sides of said rings,

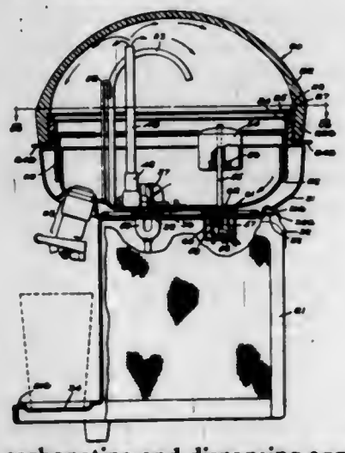
upper rings, supporting struts connecting the upper bottom ring to the upper rings on one pair of opposite sides of the case, supporting struts connecting the lower bottom ring to the upper rings on the other pair of opposite sides of the case, a pair of slidable support members, said members being hinged together at their innermost

extremities located within the case, the outermost extremities of said members being positioned beyond said pins and projecting beyond said bottom rings when in flat position, said members being adapted to assume a position at an angle to one another less than 180 degrees whereupon the outer extremities of the support members are drawn inwardly between the lower rings.



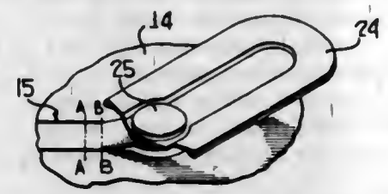
3,272,378
THERMOFORMED BOTTLE CASE
Walter O. Weber, Newark, Del., assignor, by mesne assignments, to Haveg Industries, Inc., Wilmington, Del., a corporation of Delaware
Filed Sept. 18, 1964, Ser. No. 397,478
11 Claims. (Cl. 220—21)

1. A bottle case comprising a one-piece bottom portion including a bottom wall peripherally surrounded by relatively high upstanding side walls joined thereto, means for positioning bottles in the case, said positioning means comprising projections integrally extending from said bottom wall and said side walls and a one-piece top portion including a top wall and a relatively short depending skirt peripherally joined thereto, means defining a plurality of openings through said top wall arranged to peripherally engage bottles received in the case, means on said skirt adjacent the lower extent thereof and means on said side walls adjacent the upper extent thereof for joining said bottom and top portions to one another, said bottom and top portions are each essentially composed of foamed thermoplastic sheet material having a smooth, substantially moisture impervious exterior skin of the same material integral therewith.



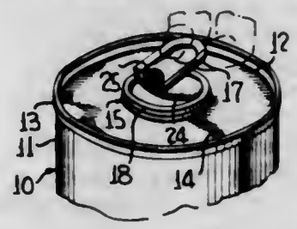
3,272,379
MULTIPOSITION MOLDED PLASTIC CONTAINER
Charles E. Driza, Belleville, N.J., and Warren L. Price, Woodhaven, N.Y., assignors to Chevron Research Company, a corporation of Delaware
Filed Mar. 9, 1964, Ser. No. 350,298
3 Claims. (Cl. 220—31)

1. An integrally molded plastic container comprising a body section, a cover section adapted to overlay the body section, said body and said cover sections each having front, rear, side and broad walls, means for hingedly attaching said sections to each other with their rear walls in substantial edge-to-edge abutting relationship, and a pair of fastening elements adjacent to said hinge means for locking said body and cover sections relative to each other, each of said fastening elements including first and second elements formed integrally with the container, said first element having a protrusion at an end remote from its forming plane with one of said sections in sliding



contact with said second element, said second element having at least two shallow openings formed therein for engagement with said protrusion, each opening being located a distance from said hinge means equal to the distance from the protrusion to the hinge means to serially engage said protrusion and place the body and cover sections in a predetermined locking relationship.

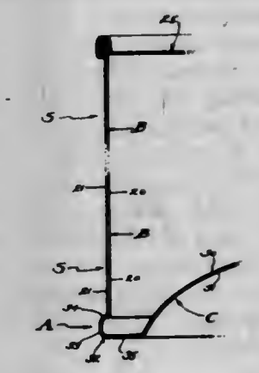
3,272,380
BEVERAGE CARBONATING AND DISPENSING APPARATUS
William H. Jacobs, Brookline, Edwin H. Nahikian, Wayland, and Alfred Armstrong, Norwood, Mass., assignors to Product R & D, Incorporated, Waltham, Mass., a corporation of Massachusetts
Original application Oct. 5, 1961, Ser. No. 146,063. Divided and this application Oct. 21, 1964, Ser. No. 416,666
4 Claims. (Cl. 220—39)



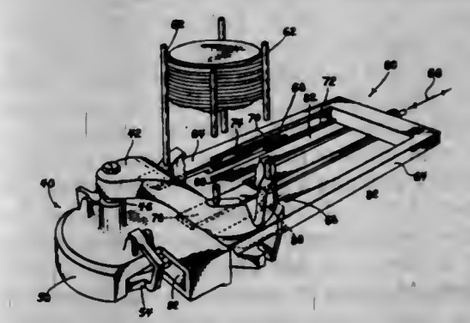
1. Beverage carbonating and dispensing apparatus comprising
a bowl having a circular side wall,
an externally threaded ring surrounding and rotatable with respect to said side wall,
a projection interconnecting the ring and the bowl limiting the upward movement of the ring on said bowl,
a cover overlying said bowl and having an internally threaded rib adapted to be screwed onto the external threads on said ring, said cover being completely removable from said ring and bowl,
and a gasket forming a seal between the cover and bowl when the cover is screwed tightly onto the ring with the ring in its uppermost position on the bowl.

3,272,381
CAN END FOR EASY OPENING BEVERAGE CANS
John S. Bozek, Chicago, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Mar. 25, 1964, Ser. No. 354,663
10 Claims. (Cl. 220—54)

1. A can end of the easy opening type particularly adapted for the dispensing of a product which may be under gaseous pressure, said can end including an end panel having a portion defined by a weakening line and being removable to define a dispensing opening, said removable portion having a starting end defined by a starting weakening line portion along which said end panel is initially ruptured in the removal of said removable portion, said weakening line including other portions extending from said starting weakening line portion and including parts of maximum resistance whereby when said end panel is initially ruptured and uncontrolled continued rupture of said end panel along said weakening line due to gaseous pressure on said removable portion occurs said parts of maximum resistance will resist and stop the uncontrolled rupture.



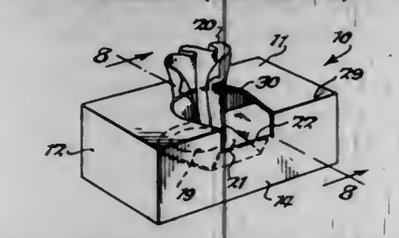
3,272,382
EASY OPENING CONTAINER
Frederick J. Stec, Oak Lawn, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Oct. 14, 1964, Ser. No. 403,860
7 Claims. (Cl. 220—54)



1. An easy opening device for containers comprising an insert receivable in a container opening for facilitating the dispensing of the contents thereof, said insert being formed of a resilient material and including a first plug adapted to be snapped into an opening for closing the opening, said first plug having a transverse wall including a removable tear strip, a second plug projecting from said tear strip, and a pull tab secured to said tear strip by said second plug for facilitating the removal of said tear strip.

3,272,383
ONE-PIECE EXTRUDED CONTAINER FOR CANNING
Leo M. Harvey, Los Angeles, Calif., assignor to Harvey Aluminum (Incorporated), Torrance, Calif., a corporation of California
Continuation of application Ser. No. 296,630, July 22, 1963. This application July 8, 1965, Ser. No. 473,896
1 Claim. (Cl. 220—66)

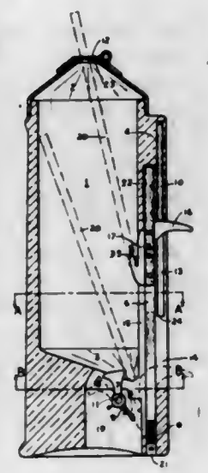
An article of manufacture comprising a seamless, cylindrical container of circular cross section having integral side and bottom walls of uniform thickness; and being formed by the bottom wall and a top end, the bottom wall being formed with a central concave shape as viewed externally from the bottom end thereof to provide added strength for withstanding internal pressures, the central concave shape being surrounded by a flat annular bottom surface perpendicular to the longitudinal centerline of the container and extending outward at least to approximately the plane of the side wall; a top secured to the side wall and closing off the top end of the container, the top and the side wall forming a bead adjacent the top end of the container and extending completely around the top end, the bead projecting radially outwardly from the side wall for a predetermined distance relative thereto and terminating in an annular flat surface parallel to the longitudinal axis of the container; a chine formed at the juncture of the side and bottom walls, extending around the bottom end, and projecting radially outwardly from the side wall the predetermined distance whereby the bead and chine have equal outer diameters, the chine also terminating in an annular flat surface parallel to the longitudinal axis of the container so that the container may be rolled in a straight line across a flat surface and may be held by the chine in automatic handling apparatus during manufacturing and filling thereof.



3,272,384
METHOD AND APPARATUS FOR SEPARATING STACKED TELESCOPED LIDS
Bryant Edwards, Clarendon Hills, Ill., assignor to Illinois Tool Works Inc., Chicago, Illinois, a corporation of Delaware
Filed Oct. 13, 1964, Ser. No. 403,583
6 Claims. (Cl. 221—1)

1. Apparatus for separating the bottommost lid from the penultimate lid in a vertical stack of telescoped flexible lids each having a top surface, and a downwardly extending side wall provided with stepped portions for stacking interference with juxtaposed lids and terminating in a lip portion, the lip portions of adjacent lids being spaced from one another by the stack height of said lids, comprising magazine means for supporting the stack of telescoped flexible lids and having an open end through which said lids are dispensed, and a reciprocating shuttle means mounted for movement relative to the open end of said magazine means to separate individual lids from said

stack of lids, said reciprocating shuttle means being movable from a retracted to a dispensing position and including means for supporting said stack of lids during part of the movement from its retracted to its dispensing position, means for imposing a progressively increasing separating force between the bottommost and penultimate lids during the movement of said shuttle means to its dispensing position and while said stack of lids is held by said supporting means to initially separate at least portions of the bottommost and penultimate lids from each other, means for engaging and moving generally diametrically opposed portions of the bottommost lid toward each other during the application of the progressively increasing separating force until the generally diametrically opposed portions of the bottommost lid are spaced from the penultimate lid, and means for entering the spaces established between the bottommost and penultimate lids as said shuttle means approaches the dispensing position to engage the penultimate lid beneath its lip portion for supporting said stack of lids and to enable movement of the bottommost lid away from said stack of lids, the supporting means of said shuttle means terminating short of said last mentioned means to enable the bottommost lid to be positively stripped from the stack of lids as the shuttle means reaches its dispensing position.

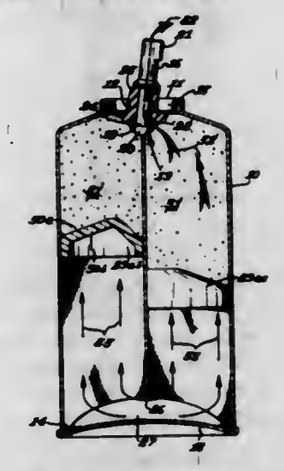


3,272,385
DISPENSER BOX
Cecil H. Watkins, Toronto, Ontario, Canada, assignor to Canadian International Paper Company, Montreal, Quebec, Canada, a corporation of Canada
Filed Apr. 12, 1965, Ser. No. 447,364
4 Claims. (Cl. 221—48)

1. A dispenser box for stacked interfolded sheets of paper and the like, comprising a rectangular box having top, bottom, end, front and rear walls, an endless line of severance in said top wall defining a manually removable flap, the opening left in said top wall upon removal of said flap being a constricting passage for removal of successive sheets one by one and pop-up of succeeding sheets, a score line in said front wall spaced from the line of juncture between said front and top walls, and a second line of severance extending upwardly from opposite ends of said score line in said front wall and through a path in said top wall encompassing and spaced from said endless line of severance, said second line of severance defining a manually freeable valve flap hingedly connected to said front wall by said score line and being adapted, when freed, to overlie the uppermost sheet of the stack of sheets in said box whereby said opening follows the level of sheets in said box as said sheets are dispensed.

3,272,386
SANITARY SIPPING-STRAW DISPENSER HAVING A RECIPROCATING EJECTOR
Leonard Atlee Wills, Arlington County, Va. (P.O. Box 7354, Benjamin Franklin Station, Washington, D.C. 20044)
Filed July 6, 1964, Ser. No. 380,530
2 Claims. (Cl. 221—254)

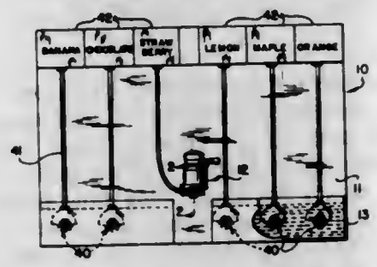
1. A straw dispenser comprising a straw receptacle and a straw ejector, said straw receptacle having a top wall, a bottom wall and sidewall, said top wall having a dispensing aperture therein, said bottom wall having an upper article funneling surface and an opening in the funneling surface, said funneling surface adapted to permit the bottom ends of straws to flow to said opening by gravity, said receptacle sidewall having a thickened vertical portion wherein is integrally formed a straight vertical cavity, a straight slender slot is integrally formed in said thickened sidewall portion and extends laterally from said vertical cavity to the interior surface of said receptacle, said slot connects with said receptacle bottom wall funneling surface opening, an exterior opening integrally formed in said receptacle thickened sidewall portion and extends from the said vertical cavity to the exterior receptacle surface, a portion of said straw ejector



is positioned in the said exterior opening and is slidable therein and adapted for use as an operating handle, said straw ejector is movably mounted in said straight vertical cavity for vertical reciprocation from a lower position to an upper position, a portion of said ejector being slidably engaged in the said straight vertical cavity, and said ejector having a portion thereof which passes through said funneling surface opening and is movable in the said slender sidewall slot during movement of the ejector from the lower position, said ejector is adapted to engage the bottom end of a streaw whereas the raising of said ejector through the funneling surface opening may engage and elevate a straw into said dispensing aperture.

3,272,387
SELECTIVE DISPENSER
Morris H. Katz and Rubin Weiner, St. Louis Park, Minn., assignors to The Pillsbury Company, Minneapolis, Minn., a corporation of Delaware
Filed Oct. 6, 1964, Ser. No. 401,908
7 Claims. (Cl. 222—48)

1. A dispenser capable of selectively dispensing one of a plurality of segregated, flowable substances contained therein through a single dispensing nozzle which comprises:



(1) a container body
  a. defining a fixed enclosed volume
  b. having a longitudinal axis, and
  c. an aperture positioned about said longitudinal axis
(2) a tubular-walled valve stem
  a. axially mounted in said aperture
  b. by means of a resilient sealing member, said sealing member
    (i) allowing tilting of said stem about at least one axis of rotation perpendicular to said longitudinal axis, and
    (ii) being in sealing contact with said aperture and said valve stem,

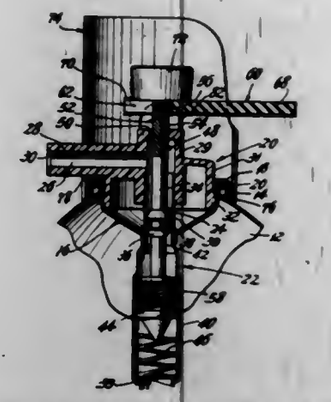
  c. said valve stem having a base portion including
    (i) a terminal surface defined by the locus of points equidistant from said axis of rotation, and
    (ii) two openings penetrating said tubular-walled valve stem near said base portion,
(3) an axially positioned divider in said container body
  a. dividing said enclosed volume into at least two compartments, said compartments positioned on opposite sides of said axis of rotation,
  b. said divider being in sealing contact with
    (i) said terminal surface,

    (ii) said resilient sealing member, and
    (iii) said container body,
(4) said openings being positioned on opposite sides of said divider,
(5) a flowable substance in said compartments and means for maintaining said substance under pressure greater than atmospheric and in contact with said terminal surface
  a. including compressed gas and pistons having a leading and trailing surface, said leading surface being in contact with said substance, and said trailing surface being in contact with said compressed gas.

3,272,388
DISPENSING METHOD AND APPARATUS
Max Earl Whitmore, Chagrin Falls, Ohio (1373, Suite A, Bluff Ave., Columbus, Ohio 43212)
Filed Nov. 5, 1964, Ser. No. 409,232
9 Claims. (Cl. 222—129.1)

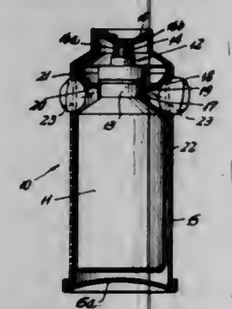
1. An apparatus for flavoring and dispensing an edible, congealed, fluid material comprising reservoir means for maintaining a supply of the congealed material under pressure; a dispensing nozzle means adjacent the reservoir means and having a discharge portion; means defining a passageway for providing fluid communication between the reservoir means and the discharge portion of the nozzle means; a valve disposed in the passageway operable to control the flow of the congealed material therethrough; supply means for maintaining a supply of separated flavoring fluids; a plurality of grid structures connected to the supply means by flexible fluid conduits, each of the grid structures being selectively positionable in the passageway and operable to inject a preselected flavoring fluid into the congealed material as the latter flows through the grid structure.

3,272,389
AEROSOL DISPENSER FOR PLURAL FLUIDS
John Frangos, Brooklyn, N.Y., assignor to Revlon, Inc., New York, N.Y.
Filed Dec. 24, 1963, Ser. No. 333,122
8 Claims. (Cl. 222—136)



3. In a pressure container and dispenser of the character described for containing a plurality of different fluid materials separately and unmixed within said container and for simultaneously dispensing and mixing said materials under the action of a propellant in said container, the combination which comprises dispensing valve means at the top of said container for emission of material therefrom under the action of said propellant when said valve means is opened, a separate compartment within said container and adjacent said valve means for containing one of said materials and maintaining it separate from the other of said materials in said container, a mixing chamber in flow communication with said dispensing valve means, an outlet from said separate compartment into said mixing chamber, an eduction tube in said container having one end in flow communication with said mixing chamber and the opposite end disposed adjacent the bottom of said container for conducting fluid therefrom into said mixing chamber for admixture therein with material flowing through said outlet from said separate compartment, additional valve means for opening and closing said outlet from said separate compartment into said mixing chamber, and operating means for simultaneously opening and closing both said dispensing valve means and said additional valve means.

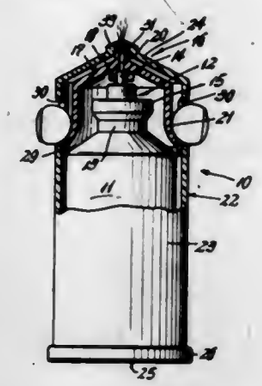
3,272,390
DISPENSING APPARATUS FOR FIRE EXTINGUISHERS
Laurence G. Horwitt, New Haven, Conn., assignor to Casco Products Corporation, Bridgeport, Conn., a corporation of Connecticut
Filed Nov. 13, 1964, Ser. No. 411,045
18 Claims. (Cl. 222—153)



1. In a pressure fluid dispenser comprising a container having a fluid under pressure therein, a dispensing device mounted on the container and including a stationary discharge head defining a discharge passageway, a manually operable member movable in the passageway between a sealing position therein and an open fluid-discharge position, said member including a finger engaging actuating portion projecting outwardly of the discharge head, and stationary guard means surrounding said discharge head and extending beyond said outwardly projecting portion

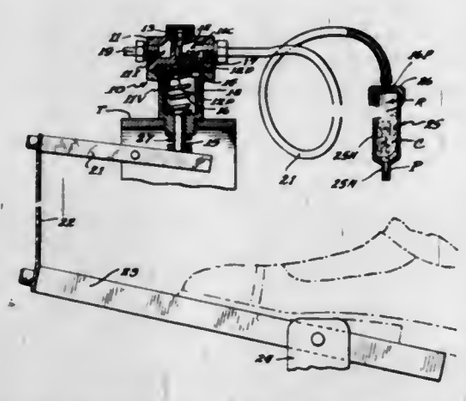
of said movable member to guard the latter against damage thereto and operation thereof when brought into engagement with a foreign object; the improvement comprising movable stop means positioned to be engageable with the outwardly projecting portion of said manually

operable member to prevent manual operation thereof to said discharge position, said stop means being movable from said engageable position and having means extending to the exterior of said guard means for manual engagement to move said stop means from said engageable position.



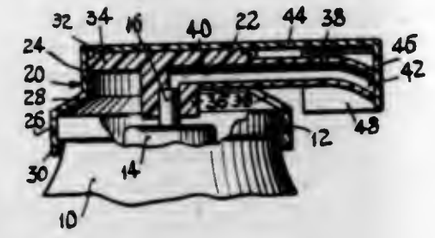
3,272,391
ACTUATOR FOR DISPENSING PACKAGE
Philip Meshberg, 15 Stoneleigh Road, Fairfield, Conn.
Filed Feb. 18, 1965, Ser. No. 433,644
17 Claims. (Cl. 222—162)

1. A dispensing package for materials under pressure comprising a container having a material under pressure therein; valve means mounted on said container for dispensing said material on the operation thereof, said valve means including a projecting stem portion longitudinally movable relative to said container for operating said valve means and having a passage therein for passing said material; and actuating means for said stem portion disposed substantially within the outline of said package and operable in a direction transverse to the path of relative movement of said stem portion and container for relatively moving the same, said actuating means being operated by the application of pressure thereagainst in the direction of said container and transverse to the path of movement of said stem portion.



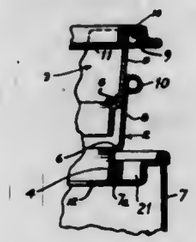
3,272,392
ACTUATOR AND CLOSURE FOR DISPENSING PACKAGE
Philip Meshberg, 15 Stoneleigh Road, Fairfield, Conn.
Filed May 3, 1965, Ser. No. 452,771
17 Claims. (Cl. 222—162)

1. A dispensing package for materials under pressure comprising a container having a material under pressure therein; valve means mounted on the container for dispensing said material on the operation thereof, said valve means including a projecting stem portion movable relative to said container for operating said valve means and having a passage therein for passing said material; and actuating means operable to move said stem portion relative to said container for operating said valve means, said actuating means comprising a part connected to said stem portion, said part having means therein cooperating with said passage in said stem portion for communicating



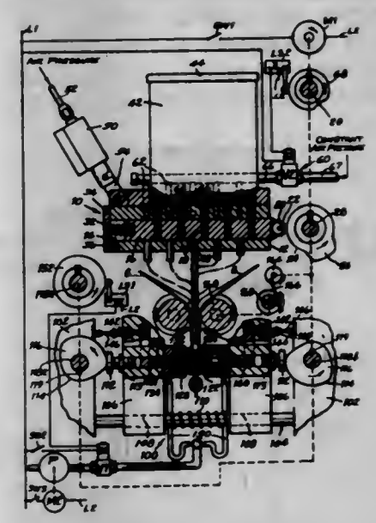
the latter outwardly of said dispensing package and being movable relative to said container on the application thereagainst of pressure applied from a position predeterminately located relative to said container in a direction substantially transverse to the axis of said stem portion for operating said valve means.

3,272,393
APPARATUS AND METHOD FOR PRECISION METERING AND DEPOSIT OF VISCOUS MATERIALS
John O. Roeser, 8611 Lincoln Ave., Morton Grove, Ill.
Filed Dec. 13, 1963, Ser. No. 330,484
9 Claims. (Cl. 222—179)



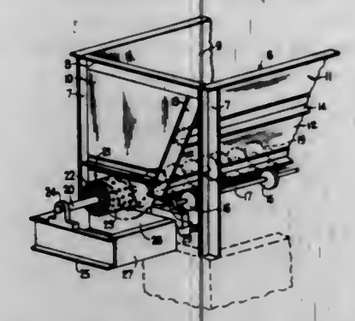
1. In an injector for one-handed precision metering and deposit of variable quantities of viscous material, the combination with an air pressure valve unit having an air inlet connected to a source of air under pressure, an outlet, and means for controlling flow of air under pressure from said air inlet to said air outlet; of a cartridge of a size and shape suitable for engagement and maneuver by hand and including a housing portion providing a reservoir for receiving a charge of viscous material and a valveless nozzle portion rigidly carried on said housing portion and providing an orifice discharge passage for said reservoir, means including an elongated flexible air supply tube having one end connected to said air outlet and having the other end connected in sealed relation to said housing portion for supplying air under pressure into a region of said reservoir remote from said nozzle portion to effect application of pressure on said charge, and treadle actuated mechanism connected to said controlling means for controlling the supply of air under pressure to said tube.

3,272,394
ACTUATOR CAP FOR SMALL FLUID DISPENSERS
Philip H. Sagarin, Bridgeport, Conn., assignor to Valve Corporation of America, Bridgeport, Conn., a corporation of Delaware
Filed Oct. 7, 1964, Ser. No. 402,225
8 Claims. (Cl. 222—182)



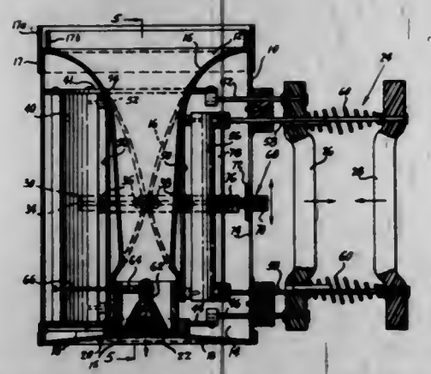
1. An actuator cap for a dispenser, comprising in combination:
(a) a depress button having a finger-engageable top surface, said button having a discharge spout projecting from one side, and said button being adapted for connection to the valve of the dispenser to actuate the same and effect a discharge of the dispenser contents,
(b) a stationary tubular cap body surrounding the depress button and arranged to provide access to the finger-engageable surface of the button, and
(c) manually removable means adapted to be discarded, comprising a cover piece fixedly carried by the cap body and overlying the button and the discharge spout of the latter to prevent free flow therefrom, said means including a laterally projecting finger tab having substantially the same configuration as the discharge spout and overlying the spout but being unattached thereto, said tab being free for movement upward and away from the spout for the purpose of removing the cover piece, said means further including frangible webs which join the cover piece and cap body together and which may be readily broken to release the cover piece upon applying a sufficiently strong upward removing force to the finger tab.

3,272,395
MIXING AND POURING ADAPTER FOR CANS
Noah Lawyer, 45 Lehigh Ave., Rochester, N.Y.
Filed July 23, 1965, Ser. No. 474,444
10 Claims. (Cl. 222—189)



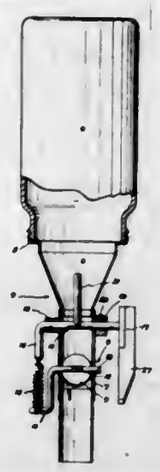
1. A mixing and pouring adapter for cans, comprising a tubular member formed of a single piece of sheet metal of substantially uniform thickness open at opposite ends and formed with an imperforate frusto-conical can engaging portion at one end, an imperforate frusto-conical outer end portion at the opposite end, and an intermediate substanially radial flange portion joining the inner end of said can engaging portion to the larger sized inner end of the outer end portion, said can engaging portion having the inner end of larger transverse dimension than the outer end and having a tapered wall portion extending between the inner and outer ends for engaging in a can opening of predetermined size with the outer smaller end of said can engaging portion extending through the opening in said can, said tapered wall engaging said can around the inner edge of the opening therein and the inner end of said can engaging portion having a slightly larger transverse dimension than the can opening so the can engaging portion may be wedged in the can through the opening therein with the outer end projecting outwardly from the can, said can engaging end portion being formed with an inwardly extending radial flange and a folded filter member having the marginal portions at opposite ends embracing opposite sides of said flange and extending transversely over a segment of the opening in said can engaging end portion.

3,272,396
METERING AND DISCHARGING APPARATUS
Albert H. Neville, Jr., Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Filed Dec. 23, 1964, Ser. No. 420,551
4 Claims. (Cl. 222—194)



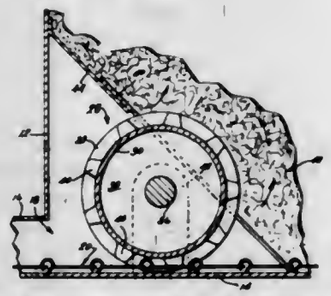
1. Apparatus for metering and discharging successive precisely controlled unit quantities of dry particulate material comprising a supporting means including a fixed lower portion and a relatively movable upper portion adjustably mounted in fixed relation to the fixed lower portion of said supporting means, a container for dry particulate material mounted for displacement with the relatively movable upper portion of said supporting means, at least one outlet for dry particulate material through the fixed lower portion of said supporting means, a metering member movably mounted between the fixed lower portion and the relatively movable upper portion of said supporting means adjustable in response to displacement of the relatively movable upper portion of said supporting means to vary the volume of at least one metering chamber within said metering member, said metering member being movable between a first position in which each metering chamber receives a predetermined quantity of dry particulate material from said container and a second position in which the same predetermined quantity of dry particulate material is discharged through each said outlet, the predetermined quantity of dry particulate material received in and discharged from each metering chamber being determined by the vertical adjustment of said container and said relatively movable upper portion of said supporting means relative to the fixed lower portion of said supporting means.

3,272,397
FEEDER OF NON-FLOWING MATERIAL
Sherman G. Bean, 151 E. Main St., Leipsic, Ohio
Filed June 20, 1963, Ser. No. 289,308
5 Claims. (Cl. 222—200)



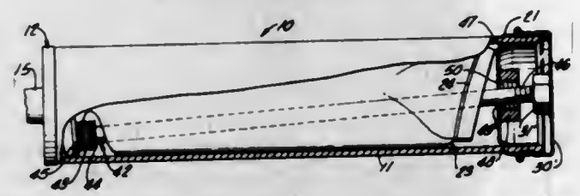
1. Dispensing apparatus for a material having a tendency to bridge comprising a hopper including a movable side panel, hinge means at an upper portion of said side panel and supported by said hopper for pivotally supporting said side panel, said hopper defining a long bottom opening, a screw conveyor extending longitudinally of said opening, a trough below and encompassing said screw conveyor, a rotatable cam supported outside said side panel by said hopper and contacting said side panel below said hinge to pivot said panel, and drive means for simultaneously driving said screw conveyor and said cam.

3,272,398
COFFEE DISPENSER
Richard W. Drosman, 234 N. 11th, Corvallis, Oreg.
Filed Oct. 15, 1964, Ser. No. 403,994
5 Claims. (Cl. 222—210)



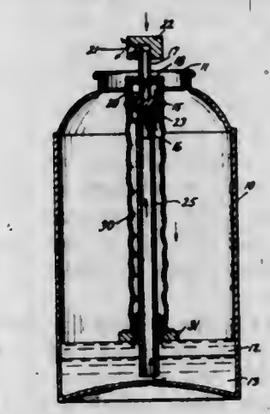
1. A dispenser for coffee or the like comprising, an upright cylindrical body having an open top and a bottom with an opening therein, an upright resilient funnel-shape liner having its upper end merging with the upper end of said body and having the lower end thereof within and spaced upwardly from said body bottom, a vertically disposed dispensing tube within said body adjacent the lower end thereof, said tube having the upper end connecting in communication with the lower end of said liner, a vertically movable plug normally closing the lower end of said tube, a handle projecting outwardly from said body, said handle including a grip member movable toward and away from said body, horizontally disposed roller means disposed within said body and spaced between said body and said liner and mounted in said body for movement into and out of squeezing engagement with the adjacent portion of the liner, and means connecting said roller means and said plug to said handle grip member actuable upon movement of said grip member toward said body to shift said roller into squeezing engagement with said liner and simultaneously move said plug to tube opening position.

3,272,399
DISPENSER FOR FLUENT MATERIALS
Walter Edward Dight, St. Ives, Sydney, New South Wales, Australia, assignor to Machine Made Sales Pty. Limited, North Sydney, New South Wales, Australia, a corporation
Filed Oct. 27, 1964, Ser. No. 406,793
Claims priority, application Australia, Nov. 12, 1963, 37,558/63
10 Claims. (Cl. 222—232)



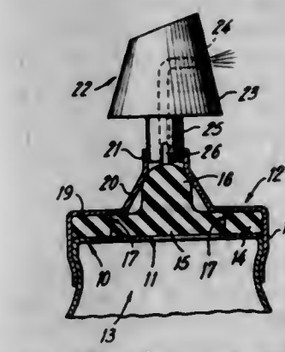
1. A dispenser for fluent materials comprising a container, a material outlet neck extending downwardly from said container, a butterfly valve in said neck comprising a valve vane mounted so as to rotate about an axis piercing said neck, the neck being such that the boundary of the neck cross-section taken on the transverse cross-sectional plane in which said axis lies does not include appreciable portions perpendicular to the axis, such that the width of said cross-section, when measured in directions parallel to said axis, progressively decreases as the distance from the axis increases, and such that the cross-section of the neck is constant throughout the portion of the neck surrounding the valve, and the valve vane having the shape of an oblique section through said neck portion taken on an oblique sectional plane in which said axis lies, and valve operating means adapted to shift said butterfly valve rapidly from one closed position through an intermediate open position to another closed position, said operating means being snap-acting and including an operating spring which may be stretched and at the same time shifted until its line of action crosses a dead center position whereon the spring contracts to move the valve.

3,272,400
FEED SAVER FOR AUTOMATIC FEED APPARATUS
Robert L. Van Huis, Zeeland, Mich., assignor to Big Dutchman, Inc., Zeeland, Mich., a corporation of Michigan
Filed Jan. 18, 1965, Ser. No. 426,154
8 Claims. (Cl. 222—318)



1. Apparatus for returning feed back into the inlet of a bulk feed hopper from a trough in which a conveyor member travels to transfer feed from the hopper throughout the length of the trough, said apparatus comprising: a cylindrical compacting element; means for mounting said element within said hopper at its said inlet; said means mounting said element for rotation about its longitudinal axis at a predetermined height above said conveyor member; means extending outwardly beyond the surface of said compacting element for engaging said traveling conveyor member and driving said element in a rotary manner; said element rolling against and compacting feed above said predetermined height which is being returned to said hopper in said trough; said extending means moving the compacted feed upward into said hopper as it rotates; and means effectively shielding the upper and rear portions of said compacting element and extending means to prevent feed in the hopper from returning to the said trough upstream of said hopper inlet.

3,272,401
VISCOUS FLUID EXTRUSION APPARATUS
Robert H. Fendler, 1805 Lucretia Ave., and Alec Mitchel, 1447 Allenford, both of Los Angeles, Calif.
Filed Dec. 23, 1964, Ser. No. 420,658
6 Claims. (Cl. 222—326)

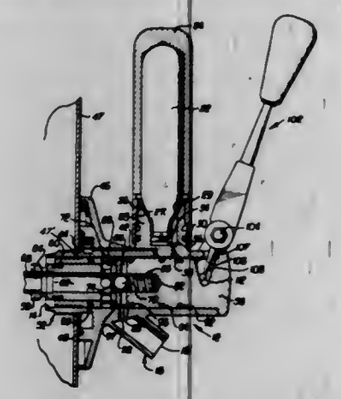


1. A fluid dispenser comprising: an elongated, hollow, rigid body; a disc fixed to and enclosing a forward end of said body, said disc having an opening therethrough; a plunger in the rearward end of said body; a plunger rod; and a cap for the rearward end of said body, one end of said plunger rod being adapted for connection with said plunger, said cap being adapted for connection with the other end of said plunger rod and with the said rearward end of said body, said plunger having an opening therethrough, said plunger rod being located at one side of said bag, inside said body and through said plunger hole.

3,272,402
AEROSOL DISPENSING APPARATUS
John Frangos, Brooklyn, N.Y., assignor to Revlon, Inc., New York, N.Y.
Filed Dec. 24, 1963, Ser. No. 333,147
7 Claims. (Cl. 222—394)

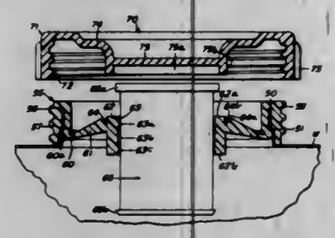
1. In a pressure container and dispenser of the character described adapted to contain a plurality of immiscible liquids forming separate liquid layers and to dispense a mixture of materials from all said layers simultaneously under the action of a propellant in said container, the combination which comprises dispensing valve means in said container for emitting materials contained therein under the action of said propellant upon opening of said valve means, an eduction tube disposed in said container and having one end in flow communication with said valve means and the opposite end disposed adjacent the bottom of said container for conducting material in the lowest of said plurality of layers from adjacent the bottom of said container to said valve means, at least one supplementary eduction tube having one end in flow communication with said valve means and the opposite end disposed within one of said immiscible layers other than said lowest layer of material in said container, and float means on said supplementary eduction tube at the end thereof opposite to said valve means and adapted for floating on the one of said immiscible layers to be dispensed through said supplementary eduction tube.

3,272,403
VALVE FOR PRESSURE CONTAINER
Claude Livingston Alexander, New Hope, Pa., assignor to American Can Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 19, 1964, Ser. No. 404,639
6 Claims. (Cl. 222—394)



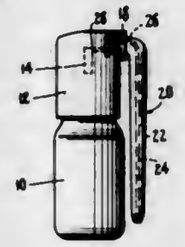
1. A dispensing valve for a pressure container comprising an annular transverse wall means surrounding an opening leading to the interior of said container, an elastomeric valve element bridging said opening with its peripheral margin resting upon said wall means, said valve element having a solid central portion and a plurality of slitted perforations disposed between said peripheral margin and central portion, said perforations being normally closed because of the inherent resiliency of said valve element when in its normal relaxed position but adapted to be flexed open when said central portion is depressed, and a retaining-seating member extending upwardly and inwardly from said wall means to sealingly anchor said valve element in said bridging position, said retaining-seating member including a central annular portion disposed over and sealingly engaging said central portion of said valve element to provide a valve seat therefor, and an actuator including a hollow depending stem slidably disposed in said annular portion for depressing said valve element.

3,272,404
FLUID DISPENSER
Spencer E. Graves, Tustin, Calif., and Fred A. Robirds, Jr., 14361 Clarissa Lane, Tustin, Calif.; said Graves assignor to said Robirds
Filed Nov. 10, 1964, Ser. No. 410,199
12 Claims. (Cl. 222—396)



1. A fluid dispenser comprising a container, a valve head having a longitudinal bore and a gas inlet, a gas outlet, a fluid inlet, a fluid outlet, and means for removably attaching said valve head to said container so as to provide an air-tight seal between the container and

the gas outlet and between the container and the fluid inlet, a slidable valve which fits in and is movable within the valve head bore to an open position whereby substantially simultaneously passageways are defined between the gas valve and the valve head through which the gas inlet can communicate with the gas outlet and the fluid inlet can communicate with the fluid outlet and whereby said slidable valve is movable to a closed position where said passageways permitting communication between the



gas inlet and the gas outlet and between the fluid inlet and the fluid outlet are closed substantially simultaneously, handle means connected to said valve head and extending into said bore so as to be able to slidably move the valve between said closed and open positions, and a safety valve biased in position within said valve which allows communication between the fluid inlet and fluid outlet under a predetermined amount of excess pressure through the fluid inlet.

3,272,405
CLOSURE FOR CONTAINER
George W. Todd, Bronxville, N.Y., and Edgar B. Edwards, Warren, Pa., assignors to Techs Incorporated, Warren, Pa., a corporation of Delaware
Filed Dec. 31, 1964, Ser. No. 422,862
21 Claims. (Cl. 222—525)

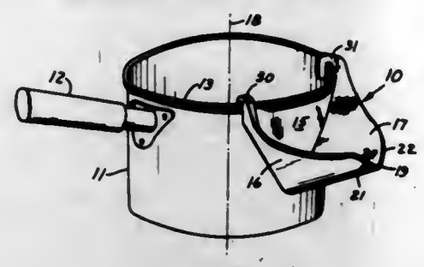
1. A container partly defined by a wall having an opening therein; a resilient sealing element for said opening having an annular outer wall portion received by and attached to said wall at the opening, a relatively thin and flexible annular portion joining with the annular wall portion and initially inwardly thereof and an initially upwardly extending central portion increasing in relative thickness inwardly from the relatively thin and flexible annular portion and having an annular V-shaped groove portion extending inwardly from the top of the central portion and a portion within the outline of the annular V-shaped groove portion adapted for forming an aperture therethrough, said annular wall portion having threads thereon for receiving a closing and operating member for the sealing element; and a closing and operating member for the sealing element having a threaded portion for reception by the threaded portion of the sealing element and a central portion for abutment against the top of the upwardly extending central portion of the sealing element so as to push it downwardly as the closing and operating member is threaded to the sealing element whereby the relatively thin and flexible annular portion and the central portion is flexed into a generally horizontal position with the relatively thin and flexible portion flexed into sealing engagement with the adjacent portion of the upstanding flange and whereupon the annular V-shaped groove portion closes to form a solid rigid portion with the central portion of the sealing element as that portion flexes into the generally horizontal extending position.

3,272,406
DIRECTIONAL APPLICATOR FOR HAND-HELD DISPENSERS
Herbert G. Lehmann, Easton, Conn., assignor to Valve Corporation of America, Bridgeport, Conn., a corporation of Delaware
Filed Oct. 26, 1964, Ser. No. 406,968
4 Claims. (Cl. 222—531)

1. A dispensing device constituting a directional actuator for use with small hand-held dispensers of the type having a container provided with an upstanding hollow depressible valve stem through which the substance to be dispensed passes, said actuator comprising in combination:

(a) a cap having means engageable with said valve stem to mount the cap thereon whereby depressing movement of the cap depresses the stem,

(b) said cap having a hollow portion providing a discharge passage and having on said portion a cylindrical bearing surface disposed so that its axis extends at a right angle to the axis of the valve stem, said bearing surface encircling the discharge passage,



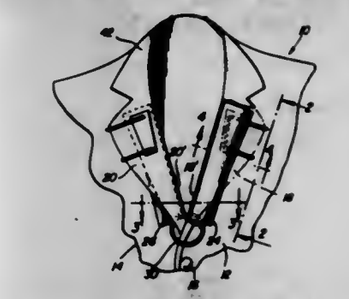
(c) an L-shaped spout having short and long hollow leg portions and discharge passages therein, communicating with each other,

(d) said short leg portion of the spout telescopically fitting the hollow portion of the cap and having a cylindrical bearing surface sealingly engaging the cylindrical bearing surface of the cap whereby the spout is mounted on the cap for pivotal movement of the long leg portion in a circular path which is spaced from and parallel to the axis of the valve stem, thereby to enable the long leg portion to be disposed either alongside the container or else in positions extending away from the container, and

(e) cooperable valve means on the cap and short leg portion of the spout, shutting off communication between said discharge passages of the cap and the spout when the long leg portion is substantially alongside the said container and connecting said passages for substantially all other positions of the long leg portion,

(f) said valve means comprising flat abutting surfaces of the hollow cap portion and end of the short leg, extending around the discharge passages thereof and disposed in a plane which is transverse to the axes of said discharge passages of the cap and short leg portion, and parallel to the said circular path of travel of the long leg portion, and further so that they are spaced from and parallel to the axis of the valve stem when the cap is carried by the latter.

3,272,407
FLEXIBLE SNAP-ON SPOUT FOR CURVED RIM CONTAINERS
Jack B. Ottestad, 1442 Muirlands Drive, La Jolla, Calif.
Filed Aug. 6, 1964, Ser. No. 387,903
3 Claims. (Cl. 222—569)

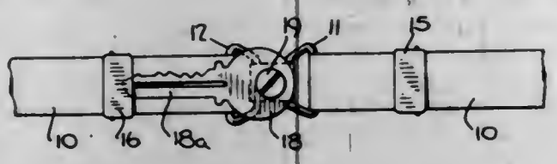


1. A spout for a container adapted to be attached to and detached from a curved rim thereof, said spout comprising: a generally trihedral structure including a stiffly flexible backing wall member having an upper edge and a lower extreme; a pair of trough members, said trough members intersecting the backing wall member, and intersecting each other along an axial plane which lies normal to the backing wall member, the three members forming an open-topped structure, the trough members intersecting to form a trough bottom which extends away from the backing member along an incline which rises from its intersection with the backing wall member and terminates at an elevation beneath the upper edge; a pair of hook members on the opposite side of the backing wall member from the trough members, each of said hook members including a binding surface and an elevation-defining surface, the binding surface being spaced from and facing toward the backing wall member beneath the elevation-defining surface, the elevation-defining surfaces being no lower than the upper edge of the backing wall member, the hook members being integral with the structure and forming therewith a continuous body, the hook members having an inner surface continuous with the inside surface of its respective trough member, which inner surfaces and inside surfaces rise to elevations substantially above the elevation-defining surfaces in order to create a channel extending beyond both sides of, and above, the backing wall member to prevent fluids from leaking or spilling along the rim when the spout is attached to a rim and the rim is tilted.

3,272,408
GARMENT BUCK APPARATUS
Virgil R. Carpenter, Roseville, and James E. Jennings, Minneapolis, Minn., assignors to The Unipress Company, Incorporated, Minneapolis, Minn., a corporation of Minnesota
Filed May 12, 1965, Ser. No. 455,181
22 Claims. (Cl. 223—73)

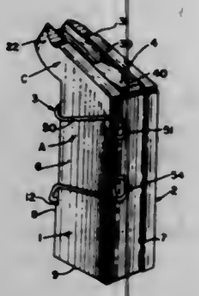
1. A buck assembly for a tubular portion of a garment to be pressed comprising an axially elongated support member having a one end portion and an opposite end portion, a first elongated wing assembly extending along one transverse side of the support member, a second elongated wing assembly extending along the opposite transverse side of the support member, each wing assembly having a one end and an opposite end, means for movably attaching the one end of the second wing assembly to the one end portion of the support member, means for movably attaching the opposite end of the first wing assembly to the opposite end portion of the support member, and means connected to the one end of the first wing assembly and the opposite end of the second wing assembly for transversely moving said first wing assembly one end and second wing assembly opposite end transversely away from the support member and alternately toward the support member, the last mentioned means including a piston cylinder combination having a cylinder and a piston rod, first linking means movably connected to the cylinder for, upon operation of said combination, moving the first wing assembly as set forth above, and second linkage means movably connected to the piston rod for, upon operation of said combination, moving the second wing assembly as set forth above.

3,272,409
LAPEL HOLDER
Carlos Miller, Nogales, Ariz., assignor of ten percent to Stanley Capin, Nogales, Ariz.
Filed Oct. 19, 1965, Ser. No. 497,747
8 Claims. (Cl. 223—84)



1. A lapel holder comprising a pair of elongated lapel backing and anchoring members adapted to underlie the lapel portions of a suit jacket or the like, said members being disposed in generally side-by-side relation with one pair of corresponding end portions thereof closely adjacent each other and the other pair of corresponding end portions spaced further apart so that said members are divergent toward said other end portions thereof and form a generally V-shaped assemblage adapted to correspond to the V-shaped opening defined between the lower ends of the adjacent edges of said lapel portions and have said lapel portions lapped thereover, means interconnecting said one pair of end portions of said members, said other pair of end portions of said members including individual elongated panel-like members supported from said anchoring members and extending longitudinally thereof, overlying the upper surfaces of said anchoring members, and biased toward frictional engagement with said upper surfaces so as to be adapted to clampingly secure said lapel portions between said upper surfaces and said panel-like members.

3,272,410
KEY-BELT
Emeric Reisman, 1606 47th St., Brooklyn, N.Y.
Filed Aug. 28, 1964, Ser. No. 392,701
2 Claims. (Cl. 224—5)

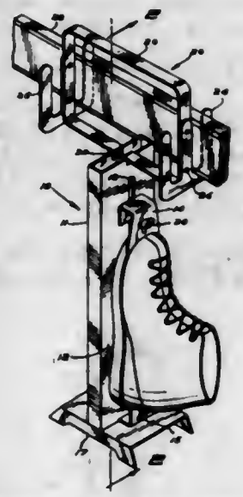


1. A belt, comprising an elongated strip and a main buckle construction at the opposite end regions of said strip, said main buckle construction comprising a mounting plate secured at one end to one of said end regions of said strip and having fastening means at its other end

for releasable engagement with the other end region of said strip, a key secured to said mounting plate in such position that the bit thereof extends over said other end region of said strip upon engagement of said fastening means with the latter, and retaining means adjustably

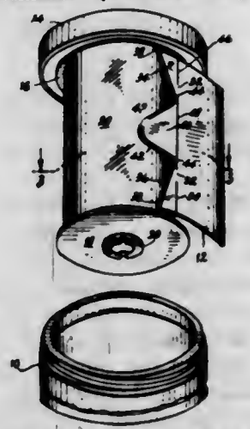
connected with said other end region of said strip in spaced relation to the point of engagement between said fastening means and said other end region of said strip, said retaining means being engageable with said bit of said key to constrain the same to lie flush against said one end region of said strip.

3,272,411
PORTABLE STORAGE AND DISPENSING DEVICES
Roy R. Hanson, Maryland Heights, Mo., assignor of one-fourth to William H. Anderson, Glencoe, Mo., and one-fourth each to Joseph H. Schlerman and George Blase, both of St. Louis, Mo.
Filed Aug. 20, 1964, Ser. No. 390,965
10 Claims. (Cl. 224—15)



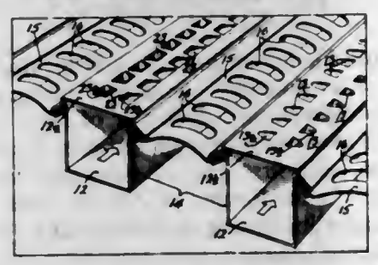
8. An ammunition dispensing carrier comprising an open-sided box-like housing having a side wall and being adapted to contain a supply of cartridges a removable side wall fitted over the open side of said housing, means resiliently mounting said removable side wall on said housing, a dispensing chute at one end of the housing and removable side wall, said chute being provided with a discharge mouth, spring-biased means carried by the housing for urging the cartridges toward and into the chute in transversely extending position, and inwardly presented opposed camming shoulders mounted on said side wall of the housing and removable side wall adjacent said chute, said camming shoulders being adapted to engage the ends of the endmost cartridge and normally prevent escape of the cartridges, said chute having a finger slot located adjacent said camming shoulders whereby digital access to the engaged endmost cartridge is provided, said camming shoulders each having an inwardly opening laterally presented recess in which only the pointed end of the cartridge will catch whereby upon exertion of digital pressure on the endmost cartridge the butt end thereof will be released from engagement with a camming shoulder and the pointed end will catch in the recess of the opposite camming shoulder so that the cartridge will swing out into longitudinal orientation with the chute and the butt end will be presented outwardly through the discharge mouth.

3,272,412
PACKET FOR CARRYING GOLF TEES AND DISCS
Anthony J. Antonious, Baltimore, Md., assignor, by direct and mesne assignments, to The Ajac Corporation, Baltimore, Md., a corporation of Maryland
Filed May 19, 1965, Ser. No. 457,128
5 Claims. (Cl. 224—26)



1. A foldable packet for releasably holding and carrying a plurality of golf tees, the packet comprises;
(a) a foldable packet body including a tee carrying portion, a back portion, a top portion, and a cover flap, all integrally joined to one another,
(b) a projecting lug carried by the cover flap and extending from the side thereof adjacent the tee carrying portion to cooperate with a slotted hole in the tee carrying portion for releasably holding the cover flap to the tee carrying portion,
(c) means integral with the tee carrying portion and on the side thereof adjacent the back portion where the packet is folded for releasably holding a plurality of golf tees in parallel, side by side relationship with the head of each tee extending above the top of the tee carrying portion for easy removal.

3,272,413
CARRIER DEVICE FOR SKIERS
Ronald E. Pfeifer 1811 Independence Ave. S., Minneapolis, Minn.
Filed Aug. 10, 1964, Ser. No. 388,413
5 Claims. (Cl. 224—45)

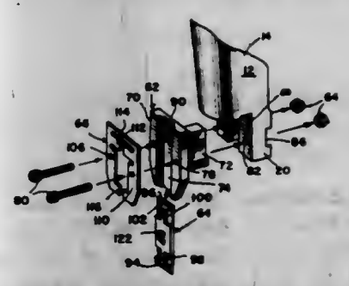


5. The carrier device for skiers comprising substantially rigid supporting plate having a pair of elongated opposed flat boot engaging surfaces, said plate having a central vertical axis extending along the axial length thereof, clamping means disposed along said plate for retaining a pair of boots in clamped position thereon with the central axis of each boot being disposed substantially along said central axis, means secured to said supporting plate for carrying a pair of skis, said ski carrying means including hook means forming at least one ski-receiving channel, the center axis of the aggregate of the ski-receiving channels being substantially co-planar with the central axis of said supporting plate, and handle means for carrying said supporting plate connected to the upper end thereof to intersect said vertical axis, said hook means secured to each side of the handle to carry skis in a position extending transversely of the supporting plate.

3,272,414
DISPENSER FOR STRIP MATERIAL
Eli I. Schefer, Plainview, and Amanollah E. Rokhsar, Forest Hills, N.Y., assignors to Revlon, Inc., New York, N.Y.
Filed Dec. 28, 1964, Ser. No. 421,323
7 Claims. (Cl. 225—45)

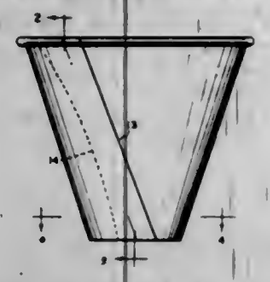
3. In combination, a container which includes a removable cover, a carrier for rolled strip material comprising spaced end plates and means for securing said plates together comprising a connecting member extending between said plates and having a strip severing means thereon, and means for removably positioning the carrier to the underside of said cover.

3,272,415
APPARATUS FOR STABILIZED TRANSPORT OF WEB- OR SHEET-LIKE MATERIALS
Sven Wallin, Taby, Sweden, assignor to Aktiebolaget Svenska Flaktfabriken, Stockholm, Sweden
Filed Mar. 16, 1964, Ser. No. 352,721
Claims priority, application Sweden, Mar. 17, 1963, 3,004/63
8 Claims. (Cl. 226—97)



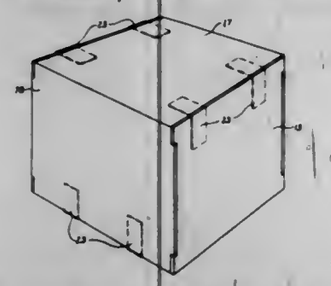
1. Apparatus for the stabilized transport of web or sheet like material supported by a gaseous medium, said apparatus comprising: at least one distribution duct for supplying said medium, said duct having a surface confronting said material and forming a guide plane therefor, gaseous medium supply ports arranged in pairs in said plane and each port of a pair directed oppositely to the other port of the pair, said supply ports including means whereby said medium is caused to flow therefrom in streams substantially parallel to said transport plane, exhaust ports in said guide plane spaced from the acting in conjunction with said supply ports to extract the medium from the space between said material and said plane, said supply and exhaust ports being positioned in relation to each other so that the medium supplied from said supply ports forms a continuous film of medium prior to being exhausted through said exhaust ports, and means to divide said continuous film into a plurality of separate streams upon being exhausted.

3,272,416
YARN HANDLING MECHANISM
Michael Burgin Emery, Seaford, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Sept. 16, 1964, Ser. No. 396,856
11 Claims. (Cl. 226—97)



1. A device for imparting tension to yarn comprising: a portable closed housing having a through passage for the yarn; a fluid jet installation located within said passage and adapted to advance said yarn therethrough under tension; and independently driven roll means also located in said passage, in advance of said jet installation, said roll means being adapted to engage said yarn and to impart additional tension thereto as it advances through said passage.

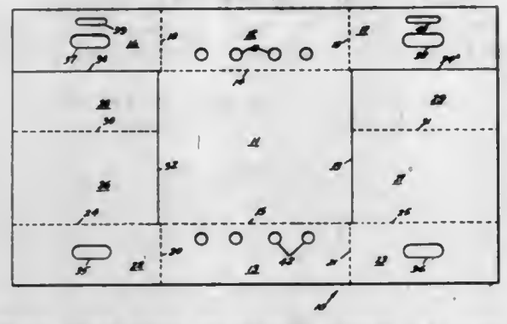
3,272,417
MAGAZINE CLOSURE AND GUIDE ASSEMBLY FOR STAPLING IMPLEMENTS
Frank Howard, Wheeling, and Arthur Langas, Chicago, Ill., assignors to Signode Corporation, a corporation of Delaware
Filed Feb. 17, 1965, Ser. No. 433,337
9 Claims. (Cl. 227—123)



1. In a fastener-applying implement, in combination, a magazine defining a chamber for holding a supply of fasteners, a vertical guide plate disposed forwardly of the magazine and having a passage therethrough in communication with the magazine chamber and through which fasteners are successively fed forwardly from the chamber, a driver for said fasteners, the forward side of said guide plate being formed with a vertical forwardly opening channel which intersects said passage, the side walls of the channel being recessed to provide a pair of guideways on opposite sides of the channel, a rigid closure plate slidable vertically in said guideways and normally closing the open side of the channel so as to establish, in combination therewith, a combined throat for receiving the fasteners from said slot and a raceway for the driver, and springs means in sliding engagement with the closure plate and yieldingly urging the latter rearwardly to maintain the same in position within the guideways, said closure plate being slidable endwise and vertically in said guideways for removal therefrom and being capable of limited displacement bodily in a forward direction so as to lift the same out of said guideways against the action of said spring means under the influence of internal pressure within the throat occasioned by staple deformation, and detent means releasably maintaining said closure plate in its channel-closing position against vertical sliding movement.

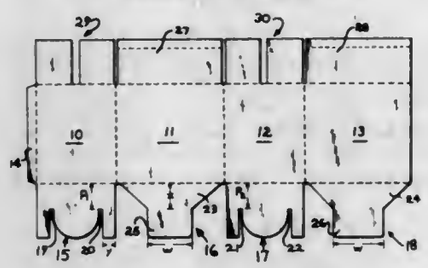
3,272,418
PAPER CONTAINER CONSTRUCTION
Raymond L. Morse and Paul H. Carter, Baltimore, Md., assignors to Maryland Cup Corporation, Owings Mills, Md., a corporation of Maryland
Filed Feb. 5, 1964, Ser. No. 342,645
4 Claims. (Cl. 229—1.5)

1. A paper blank for forming a cup comprising an arcuate strip of paper coated with a thermoplastic material, said strip having a relatively large outer arc edge and a relatively small inner arc edge, said strip having spaced radial slits extending inwardly from the inner arc edge forming tongues, the length of said tongues being at least one-half the diameter of the bottom of the cup to be formed.



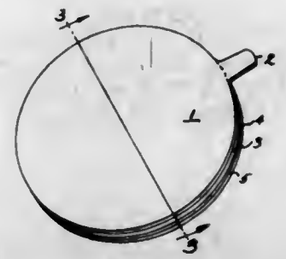
3,272,419
PACKAGING CONTAINER
Joseph H. Vineberg, 235 Somerset St. W., Ottawa, Ontario, Canada
Filed Sept. 28, 1964, Ser. No. 399,627
1 Claim. (Cl. 229—23)

A packaging container comprising a pair of unitary blanks of sheet material, each of said blanks consisting of an intermediate panel and a pair of end panels foldably connected to said intermediate panel, each said end panel having a pair of opposed edge portions and an intermediate edge portion joining said opposed edge portions, each of said opposed edge portions of one of said blanks having a notch therein, each of said opposed edge portions of the other of said blanks having a tongue thereon for reception in one of said notches, each of said intermediate edge portions of one of said blank being engageble with one of said intermediate edge portions of the other said blank, each said tongue having a length constituting the major portion of the length of said end portion, each said notch having a length approximately equal to that of said tongue.



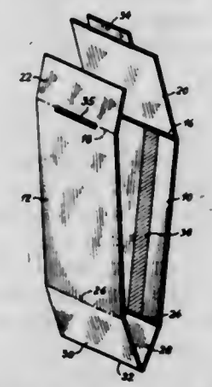
3,272,420
ONE-PIECE PARTITIONED PACKING BOX
Gerald A. Hock, Cincinnati, Ohio, assignor to The Mead Corporation, Dayton, Ohio, a corporation of Ohio
Filed Sept. 3, 1964, Ser. No. 394,237
4 Claims. (Cl. 229—27)

1. A one-piece box having a central transverse partition formed from a single blank comprising an outside bottom section, first and second side sections foldably connected to opposite sides of said outside bottom section along fold lines between said side sections and said outside bottom section, inside end sections foldably connected to opposite ends of said first side section along fold lines between the inside end sections and the first side section, inside bottom sections foldably connected to the sides of said inside end sections along fold lines between said inside bottom and said inside end sections adjacent the fold line connecting the first side section with the outside bottom section and lying adjacent the ends of the outside bottom section, partition sections foldably connected to the sides of said inside bottom sections opposite the inside end sections along fold lines between the partition sections and the inside bottom sections,



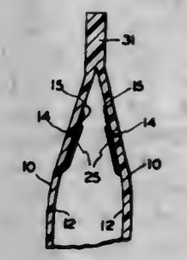
severance lines being provided between the inner edges of the partition sections and inside bottom sections adjacent the edges of the outside bottom section, said partition sections extending parallel to said end walls in abutting relation centrally of the box, outside end sections extending from the ends of the second side section and fold lines between the outside end sections and the second side section, and there being severance lines between the adjacent outside end sections and the partition sections.

3,272,421
SELF-LOCKING CARTON
Gerald E. Perry, Waterville, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Filed May 11, 1964, Ser. No. 366,500
5 Claims. (Cl. 229—39)



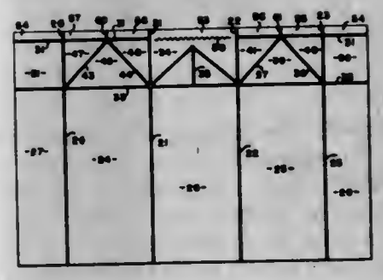
1. A carton having an integral, self-locking end closure comprising, four foldably connected side panels forming a tubular configuration, a first pair of flaps foldably connected to the lower edge of opposed panels of said tubular configuration, said first pair of flaps each having a pair of spaced-apart slots formed in the free edge thereof, said slots continually increasing in width as they proceed from the ends thereof toward said free edge, said first pair of flaps adapted to be folded into coplanar relationship with the slots in one flap being in alignment with the slots in the other flap, a second pair of flaps foldably connected to the lower edge of the other opposed panels of said tubular configuration, said second pair of flaps having an outer portion thereof of approximately the same width as the length of the slot formed by the closing of the first pair of flaps, said second flaps being folded into overlying relationship with said first pair of flaps and continued folding of said flaps forces the inward movement of said first flaps until the ends of said second flaps enter the corresponding slots in said first flaps and release of folding pressure on said second flaps permits the squaring of the flaps in interlocking relationship, and said outer portion of said second flaps extending through the slots formed by said first flaps.

3,272,422
RECLOSABLE PACKAGE
Harmon B. Miller, Atlanta, Ga., assignor to Paramount Paper Products Company, Omaha, Nebr., a corporation of Delaware
Filed Mar. 31, 1965, Ser. No. 444,271
9 Claims. (Cl. 229—43)



1. A package comprising a receptacle having an opening for receiving and removing a product and a closure member adapted to at least partially close said opening, said closure member having a coating of pressure sensitive adhesive mass on at least a portion of the area thereof which is adjacent said package, and a peelable film, overlying said pressure sensitive adhesive, which is permanently sealable to said package and from which said closure member can be removed without substantial transfer of pressure sensitive adhesive mass to said film, whereby upon permanently sealing said film to said package said closure member may be removed and then resealed to the package.

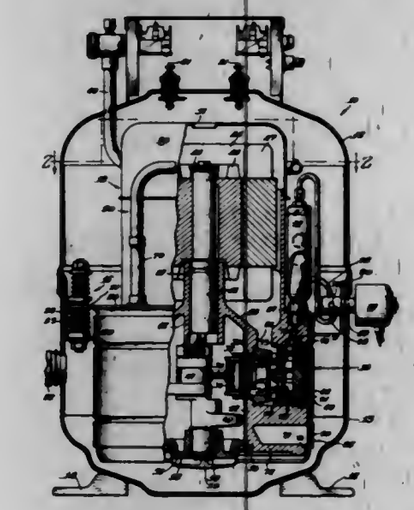
3,272,423
CONTAINER STRUCTURES
Knud Maro Henrik Bjarno, Stenlose, Denmark
Filed Aug. 9, 1965, Ser. No. 478,196
Claims priority, application Denmark, Dec. 5, 1961, 4,840/61; Great Britain, Aug. 10, 1964, 32,492/64
13 Claims. (Cl. 229—55)



1. As an article of manufacture for use with a collapsible bag having only a first pair of opposite, substantially plane side walls, a second pair of opposite foldable side walls and a closed bottom of a predetermined transverse extension between said side walls in the opened condition of said bag, an elongated web of substantially self-sustaining material having transverse folding lines effectively subdividing said web into a substantially flat middle portion substantially corresponding to the width of said bottom of said bag and a transverse folding line substantially in the middle of said middle portion, adjoining side portions operable to extend along a substantial part of said first side walls of said bag, and end flaps operable to overlie each other to construct from said web a tubular protective structure of substantially rectangular configuration operable to provide itself as an exterior protection outside said bag in the open condition thereof when said bag is filled with a predetermined amount.

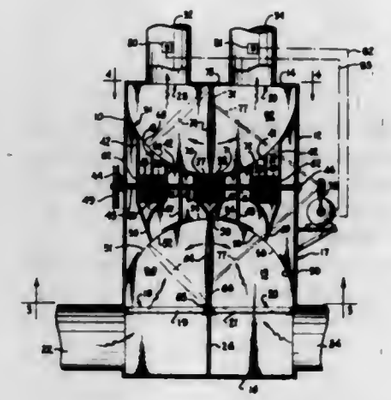
3,272,424
FLEXIBLE CONTAINER
Edward G. Rodkey, Fresno, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 11, 1965, Ser. No. 424,573
5 Claims. (Cl. 229—66)

1. A generally flat rectangular container formed from two superimposed flexible sheets wherein each sheet contains at least one heat-sealable thermoplastic resin surface, said resin surface forming the inner wall of said container, said container having at least two opposing fin-type edge seals, a perforated tear line in at least one of said sheets extending to opposite fin-type edge seals, said edge seals being notched at the points of contact of said tear line with said edge seal, at least two partially superimposed heat-sealable thermoplastic resin tapes parallel to and covering said tear line, each of said tapes being alternately sealed to the inner wall in a line parallel to but set off from said tear line at opposing sides of said tear line, said resin tapes also being sealed to the said fin-type edge seals at least one of said resin tapes containing partial transverse slits adjacent to said edge seals.



3,272,425
GABLE TOP CONTAINER
David Bendersky, Overland Park, and Daniel J. Klos, Mission, Kans., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Mar. 16, 1965, Ser. No. 440,192
3 Claims. (Cl. 229—17)

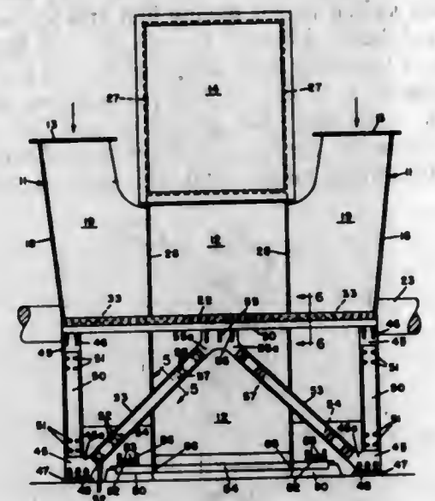
1. A gable top container formed of paperboard or the like, comprising a tubular body rectangular in cross section and having four side wall panels, said body having a bottom closure affixed thereto, front and rear roof closure panels extending upwardly from opposite side wall panels and being inclined toward each other, a pair of opposed end closure panels extending upwardly from the remaining opposite side wall panels and being inclined toward each other between said roof closure panels, a pair of triangular fold-back panels integral with each end closure panel and being folded against the under sides of said roof closure panels, a ridge panel surmounting each of said roof panels, and said fold-back panels, all of said ridge panels being disposed vertically



in contacting relation to form a laminated ridge, the contacting surfaces of the ridge panels surmounting said roof panels and fold-back panels being sealed together by a permanent adhesive bond, the outer major portions of the confronting contacting surfaces of each pair of ridge panels surmounting said fold-back panels and extending inwardly from the ends of said laminated ridge being unsecured, said front roof panel being formed with a weakened line of severance extending transversely of said roof panel in proximity to the joinder of the ridge panel thereto, a tape overlying the area about said weakened line of severance and being permanently bonded to said front roof panel, the ridge panel surmounting the same and extending upwardly over the top edge of said laminated ridge and downwardly and being bonded to the ridge panel surmounting said rear roof panel, a tear cord underlying the area of said tape extending along the top edge of said ridge, the ends of said tape extending laterally beyond the ends of said ridge, said tape serving to maintain the unsecured portions of said pairs of ridge panels in liquid tight relation.

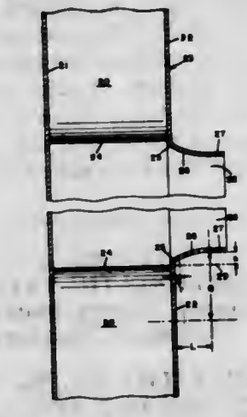
3,272,426
REFRIGERANT COMPRESSOR CONTROL
Sidney A. Parker, Fort Worth, Tex., assignor to Lennox Industries Inc., a corporation of Iowa
Filed Oct. 19, 1964, Ser. No. 404,847
6 Claims. (Cl. 230—31)

1. In a hermetic compressor, the combination of a sealed casing, a compressor block resiliently supported within said sealed casing, a plurality of cylinders in said compressor block, a piston reciprocatingly movable in each cylinder, a drive shaft journaled in said compressor block and operatively driven by an electric motor disposed in said sealed casing, the end of each cylinder being closed by a cylinder head, annular wall means surrounding said compressor block, said compressor block being spaced from said sealed casing so as to define a compartment for receiving suction gas, said annular wall means and said compressor block defining therebetween a discharge gas muffling chamber, each cylinder communicating with said discharge muffling chamber via passage means in said compressor block, said capacity control mechanism for selectively unloading one cylinder comprising valve means within said sealed casing having an inlet and first and second outlets, said inlet communicating with the passage means from said one cylinder for receiving high pressure discharge gas therefrom, said first outlet communicating with said suction gas compartment, said second outlet communicating with said discharge gas muffling chamber, valve elements in said valve means for selectively communicating said inlet either to said first outlet to unload said one cylinder or to said second outlet to load said one cylinder, and control means for actuating said valve elements in response to predetermined conditions.



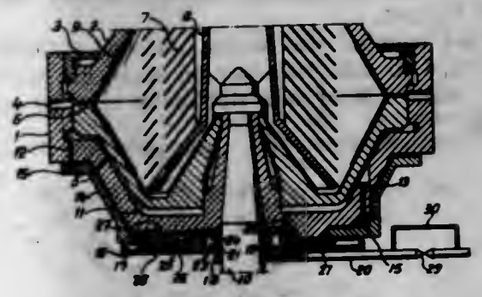
3,272,427
AIR HANDLING APPARATUS
William M. Valentine, 520 Lloyd Bldg., Seattle, Wash.
Filed May 17, 1965, Ser. No. 456,217
3 Claims. (Cl. 230—47)

1. Air handling apparatus, comprising:
means forming a plenum chamber having oppositely located dual adit and dual exit apertures;
collateral inlet and collateral exhaust conduits associated respectively with said dual adit and dual exit apertures external of said chamber;
a pair of the deflector blades pivotally mounted within said plenum chamber in opposition to each other, the pivotal mount of one said deflector blade being located between the dual adit apertures and the other said deflector blade having its pivotal mount located between said dual exit apertures;
means for synchronously moving said deflector blades in like directions;
a pair of concave walls within said plenum chamber to define deflector chambers, each wall symmetrically facing one of said deflector blades and located closely adjacent the path of that portion of such deflector blade remote from its pivotal mount, said concave walls being spaced apart at their back sides to define a fan chamber; and
wall means in the fan chamber forming open-ended air passages between the deflector chambers and including a fan in each passage to induce air movement through said passages between said deflector chambers and the opposed dual adit and dual exit apertures.



3,272,428
SUPPORTS FOR CENTRIFUGAL FANS
Albert H. Loehr, Jr., Westwood, Mass., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 10, 1964, Ser. No. 417,421
20 Claims. (Cl. 230—128)

1. A centrifugal fan comprising a scroll-shaped inner casing, generally rectangular inlet boxes at opposite ends of said casing, said boxes having outer end sheets, said casing having end sheets forming the inner ends of said boxes, a first support member extending horizontally at one side of said fan, said sheets having portions extending outwardly to and attached to said member, a second support member in alignment with said first member at the opposite side of said fan, said sheets having portions extending outwardly to and attached to said second member, a third support member extending under and attached to said first member, a fourth support member extending under and attached to said second member,



base support members under the ends of said third and fourth members, and flexible plates extending between said base members and said ends of said third and fourth members and attached to said base members and to said ends of said third and fourth members.

3,272,429
ROTORS OF CENTRIFUGAL FANS
Carl O. Wood, Needham Heights, Mass., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Oct. 16, 1964, Ser. No. 404,339
3 Claims. (Cl. 230—134)

1. A centrifugal fan rotor comprising a straight, radially extending back plate, a side plate having a straight, radially extending outer portion spaced outwardly from said back plate, and a plurality of fan blades having straight inner sides in contact with said back plate and having straight outer sides in contact along their entire lengths with said straight portion of said side plate, said blades having noses equally spaced from the axis of said rotor, said rotor having a diverging, axial inlet passage, said side plate having a curved portion extending around said passage and merging with said straight side plate portion at the same distance from said axis as said noses are from said axis, the inner portion of said curved portion having in side section, a relatively small arc and a relatively small radius, and the outer portion of said curved portion having in said side section, a relatively large arc and a relatively large radius, a line extending through the outer end of said curved portion normal to said axis being not less than 0.03D and not more than 0.055D along a line parallel to said axis from said straight portion of said side plate, said outer end of said curved portion being at a distance along said line of not less than 0.015D and not more than 0.03D from a line extending through the center of curature of said inner portion of said curved portion parallel to said axis, where D is the effective diameter of said rotor.

3,272,430
SLUDGE CENTRIFUGE
Henric Wilhelm Thylefors, Stockholm, Sweden, assignor to Aktiebolaget Separator, Stockholm, Sweden, a corporation of Sweden
Filed Oct. 17, 1963, Ser. No. 316,806
Claims priority, application Sweden, Nov. 6, 1962, 11,893/62
5 Claims. (Cl. 233—20)

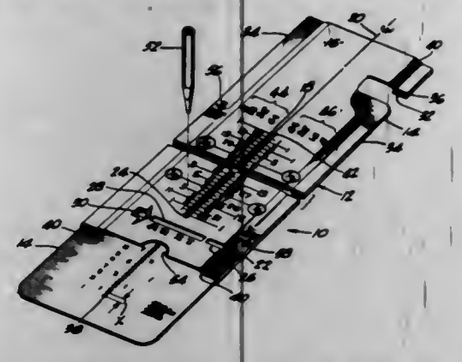
1. In a sludge centrifuge adapted for intermittent discharge of centrifugally separated sludge and comprising a hollow rotor mounted for rotation on an axis and having a separating chamber for receiving a mixture of sludge and liquid to be separated from the sludge, the rotor having a peripheral outlet for discharging sludge from said chamber, the combination with said rotor of a first valve reciprocable in the rotor along the rotor axis between positions for opening and closing said sludge outlet, said valve defining with the rotor a first hydraulic chamber having a plurality of hydraulic liquid outlets located at different radii from the rotor axis, at least one of said hydraulic outlets being located at a greater radius from said axis than is the outer periphery of the separating chamber, a second valve reciprocable along said axis for opening and closing said hydraulic outlets, the second valve being biased toward a position for closing said hydraulic outlets and partly defining a second hydraulic chamber, said second valve being axially spaced from the rotor and defining therewith a discharge passage for said hydraulic outlets, said second valve having a plurality of sealing pads for engagement with the corresponding hydraulic outlets when the second valve is closed, hydraulic liquid delivery means communicating with said first hydraulic chamber for delivering liquid thereto to hold the first valve in its said closing position and thereby accumulate sludge in the separating chamber, said delivery means also communicating with said second hydraulic chamber for delivering hydraulic liquid to the second hydraulic chamber to actuate said second valve away from its said closing position and thereby open said hydraulic outlets, whereby hydraulic liquid is drained from said first hydraulic chamber at a relatively high rate through all of said hydraulic outlets and then at a lower rate through said one hydraulic outlet, and whereby said one hydraulic outlet allows total discharge from the separating chamber.

3,272,431
FRACTION-DECIMAL CALCULATOR
Cesar M. Dablo, 309 N. Boylston St., Los Angeles, Calif.
Filed July 15, 1965, Ser. No. 472,145
1 Claim. (Cl. 235—69)

A digital adder-subtractor which is particularly adapted for adding or subtracting fractions and indicating the sum-

mation thereof in decimal form, comprising, in combination:

an elongated substantally flat base member;



an elongated substantially flat slide member;

said members being mutually disposed in longitudinally slidable relationship, said base member being made of sheet metal and having inturned longitudinal edges forming guides within which the longitudinal edges of said slide member are received;

said base member having an elongated slot extending longitudinally through a substantial portion of the length thereof, and said slide member having a row of equally spaced actuating holes formed therein and transversely aligned with said slot so as to be adapted to receive a pointer inserted through said slot;

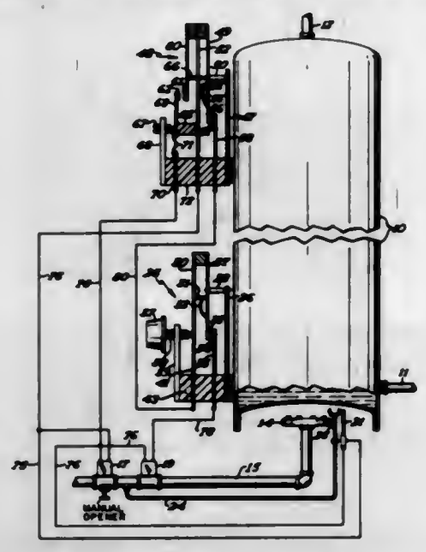
said base member having a first fraction scale written along one side of said slot, commencing at one end thereof and progressing linearly toward the other end thereof;

said base member also having a second fraction scale, identical to said first fraction scale, but written on the other side of said slot in an inverted relationship;

said base member having a pair of windows formed therein for displaying summation figures carried by the surface of said slide member;

said slide member having a pair of summation scales written thereon, the successive markings of which are adapted to be successively displayed in said windows, one of said summation scales representing fractional values and the other thereof representing the corresponding decimal values; said base member having two longitudinally extending reverse bends formed therein so that the transverse portion of said base member lying above said scale markings on said slide member is physically spaced from the surface of said slide member; whereby the insertion of a pointer through said slot into one of said actuating holes, and movement of the pointer to an end of said slot, causes an addition or subtraction to the summation figures displayed in said windows according to the distance traversed on the corresponding one of said fraction scales.

3,272,432



CONTROL SYSTEM FOR WATER HEATERS

Thomas J. Davidson, Santa Ana, Calif., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware

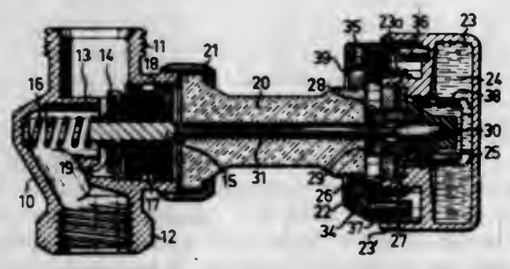
Filed Mar. 8, 1965, Ser. No. 437,644

3 Claims. (Cl. 236—21)

1. A water heater system comprising, a tank having cold water inlet and hot water outlet connections, gas burner means for heating said tank including a main burner and a pilot burner, an electrical generator energized by said pilot burner, a gas supply line for said burner means, a safety valve in said line having manually operable means for moving the valve to open position and electrically operable means capable only of maintaining the valve in open position, a control valve in said line opened when electrically energized, first thermostatic switch means located to sense water temperature at a relatively low position on said tank and adjusted to actuate its contacts at a relatively low temperature, second thermostatic switch means located to sense water temperature at a relatively higher position on said tank, said second thermostatic switch means having first and second sets of contacts and being adjusted to actuate said first set of contacts at a relatively high temperature and said second set of contacts at a still higher temperature, electrical conductors connecting said generator, said first thermostatic switch means, the first set of contacts of said second thermostatic switch means, and said control valve nor-

mally to control the water temperature in said tank at the set value of said first thermostatic switch means and at the set value of the first set of contacts of said second thermostatic switch means if the contacts of said first thermostatic switch means are closed when the first set of contacts of said second thermostatic switch means are open, and electrical conductors connecting said generator, the second set of contacts of said second thermostatic switch means, and said safety valve to control said safety valve on actuation of the second set of contacts of said second thermostatic switch means at the higher temperature.

3,272,433



THERMOSTATIC VALVES

Sven David Ferdinand Nilsson, Markaryd, Sweden, assignor to AB Markaryds Metallarmatur, Markaryd, Sweden

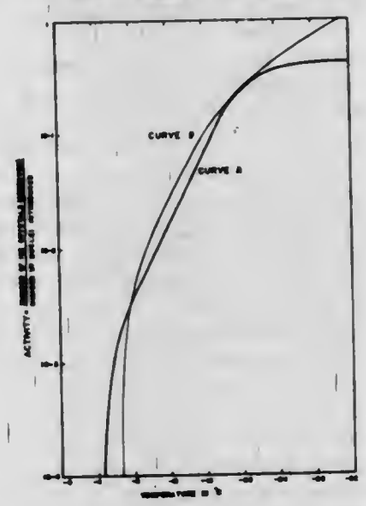
Filed July 6, 1964, Ser. No. 380,225

Claims priority, application Sweden, July 9, 1963, 7,615/63; Dec. 10, 1963, 13,687/63; Dec. 18, 1963, 14,099/63

14 Claims. (Cl. 236—99)

13. Thermostatic valve including a valve body forming an internal valve seat, a valve member slidably guided by said valve body for cooperation with said valve seat, a thermostat comprising as a sensing means a container which is to a substantial extent freely exposed to the surrounding air and the interior of which is filled with a liquid, means supporting said thermostat on said valve

body, actuating means operatively connecting said thermostat to said valve member in order to actuate said valve member responsive to the temperature prevailing in the thermostat surroundings, a diaphragm forming part of the boundary wall of said container and permitting by its yielding the liquid in said container to expand and contract in the container, a sleeve piston engaging said diaphragm, said actuating means extending through said piston and operatively engaging said diaphragm to convey to said valve member the expansion and contraction movements of said liquid, and means mounting said container for axial movement in relation to said piston by manual rotational movement of said container, said diaphragm thereby being engageable with said piston to vary the volume of the interior of said container by regulated inward pressing of said diaphragm by said piston.



3,272,434

NUCLEATING PROCESS

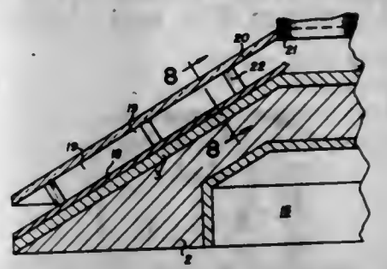
Albert C. Zettlemoyer, Diery's Bridge Road, R.D. 2, Bethlehem, Pa., John J. Chessick, Stafore Drive, R.D. 2, Bethlehem, Pa., and Noubar Tcheurekdjian, 1222 11th St., Racine, Wis.

Filed June 3, 1963, Ser. No. 285,134

20 Claims. (Cl. 239—2)

1. A method of nucleating crystallization of a hydrogen bonding crystal from a gaseous medium, which comprises seeding the medium with particles in a size range between 0.01 and 10 microns consisting of an inorganic substrate and a partial layer on the surface thereof of a different material, forming predominately hydrophobic sites, and hydrophilic sites on the surface which occupy from 5–40% of the surface area, until crystals form.

3,272,435



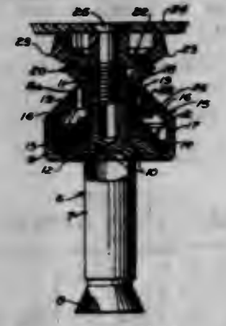
SMOG ACCUMULATION PREVENTING APPARATUS

Carl A. Brownell, Jr., 3123 S. U.S. 23, Greenbush, Mich.

Filed Oct. 10, 1963, Ser. No. 315,331

16 Claims. (Cl. 239—14)

14. An exothermic smog accumulation preventing device which utilizes sun rays to create ascending thermal currents of heated air, said device comprising a mound structure, heat insulating material forming an upper surface of said mound structure, a heat storing and radiating material above said heat insulating material, upwardly inclined air duct portions open at the lower and upper ends thereof and overlying said heat storing and radiating material and communicating near their upper ends, and a layer of relatively non-reflective, heat absorbent material overlying said air duct portions operative to absorb heat from the sun and effect the heating of air in said duct portions to a temperature higher than the temperature of the ambient air and to cause the heated air to pass upwardly through said duct portions, said heat absorbent material having an opening therein at the top of said mound in communication with said duct portions through which said heated air may pass upwardly.



3,272,436

SPRINKLER HEAD

Edwin J. Hunter, Riverside, Calif., assignor to Moist O'Matic, Inc., Riverside, Calif., a corporation of Minnesota

Filed May 18, 1964, Ser. No. 368,190

7 Claims. (Cl. 239—204)

4. A sprinkler head, comprising:

(a) a cylindrical housing open at its upper end and having a restricted inlet at its lower end;

(b) a base member including a tubular stem slidable in said inlet between a retracted and an extended position, and sealingly engaging said inlet when in its extended position to form a continuation of said inlet, an enlarged cup-shaped upper end guided in said housing, and a central upwardly directed post;

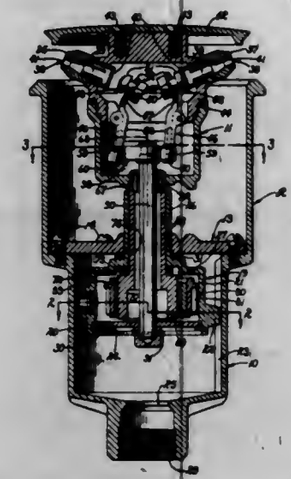
(c) a cover member surrounding said post and closing said base member to form a hollow chamber, said cover member having externally, radially inner and radially outer conical surfaces converging upwardly and intersecting to form an annular rim, and a set of at least four upwardly directed equally spaced discharge ports intersecting said annular rim;

(d) a deflector fitted on said post and having a conical face conforming to the radially inner conical surface of said cover member and continuing upwardly and outwardly beyond said rim to deflect in complementary arcs water issuing from said ports;

(e) and a cap mounted on said post retaining said deflector thereon, and clearing the spray from said ports, said cap dimensioned to close said housing when said base member is retracted.

3,272,437

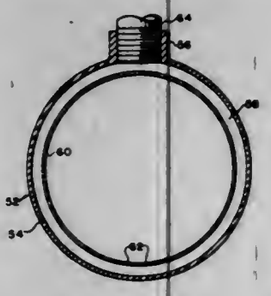
ROTARY POP-UP SPRINKLER EMPLOYING A FIXED CAM



James R. Coson, Fresno, Calif., assignor to General Sprinkler Company, a corporation of Nevada

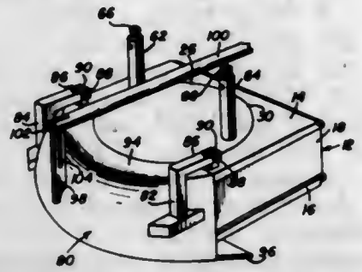
Filed July 27, 1964, Ser. No. 385,304

5 Claims. (Cl. 239—206)



1. In a sprinkler having a housing adapted to receive fluid under pressure, and a sprinkler head mounted for rotation in the housing; the combination of a nozzle

mounted on the head having an inwardly disposed intake port adapted to receive fluid from the housing, a valve engageable with the intake port to close the same urged into closed position by fluid pressure and by centrifugal force incident to rotation of the head, a cam mounted in

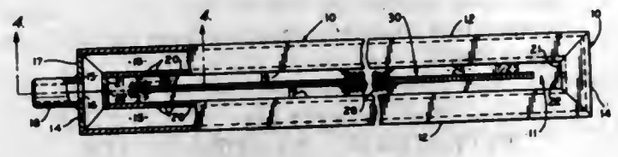


fixed position in the housing, a cam-follower mounted for rotation with the head in cam engagement, and a linkage interconnecting the follower and the valve periodically opening the valve during rotation of the head in accordance with the profile of the cam.

3,272,438
IRRIGATION SYSTEM
Rufus J. Purtell, Brownfield, Tex., assignor, by mesne assignments, to The J. B. Knight Co., Inc., Brownfield, Tex., a corporation of Texas
Filed Mar. 12, 1964, Ser. No. 351,338
7 Claims. (Cl. 239—212)

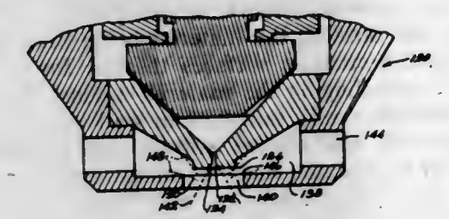
1. A fluid system designed to prevent an accumulation of grains of dense material in the system comprising in combination:
(a) a horizontal pipe adapted to carry fluid under pressure,
(b) a plurality of passageways opening into the bottom of the pipe,
(c) the lumen of the pipe straight and unobstructed at the area where each of the passageways opens into the pipe,
(d) each of said passageways extending outside the lumen to a discharge opening away from the pipe,
(e) each of said passageways being in the form of at least a portion of an annulus around the pipe from the opening into the bottom of the pipe to the discharge opening above the pipe,
(f) each of said discharge openings discharging fluid outside the fluid system, and
(g) the cross sectional area of each of the passageways being small enough that sufficient fluid velocity in the passageway is maintained to move the grains along with the fluid stream.

3,272,439
STEERING AND REVERSING ASSEMBLY FOR WATER JET BOATS
Fred W. Rosentrater, 3816 W. 115th Place, Chicago, Ill.
Filed Nov. 19, 1963, Ser. No. 324,728
6 Claims. (Cl. 239—265.25)



1. A steering and reversing assembly for water jet boats of the type including a water jet outlet, said assembly comprising an elongated housing having a longitudinal first passage formed therethrough and including means adapted to sealingly communicate the front end of said housing with said outlet, the rear end of said passage defining an upstanding generally cylindrical cavity in said passage, a steering body snugly and rotatably disposed in said cavity blocking the rear end of said passage and having a generally diametric second passage formed therethrough forming an oscillatable continuation of said first passage and including a forward end communicated with the forward end of said first passage, said steering body projecting outwardly of the rear end of said housing, said housing including opposite side walls whose upper marginal portions are interconnected by means of a top wall, said top wall having a partial circular opening formed therein communicating with the rear edge portion of said top wall, said steering body including a top wall having a generally circular portion journaled in said opening, an arcuate water jet deflection and reversing body, means pivotally securing said reversing body to said housing for rotation about an axis extending transversely of and disposed slightly above the rear end of said first passage and along a line disposed in a plane substantially normal to the longitudinal centerline of said first passage, said reversing body being generally semi-circular in radial cross-section and being swingable from a raised inoperative position disposed rearwardly of and above the rear marginal portions of said steering body and a lowered position with said reversing body positioned behind and in horizontal alignment with said steering body, said reversing body, when in said lower position, including an extended lower lip disposed slightly below the lower portion of the rear end of said steering body and also a centrally disposed arcuate upper lip rotatably receiving and disposed in sealing engagement with the rear marginal portion of the circular portion of said top wall of said steering body projecting outwardly of the rear of said housing.

3,272,440
GAS BURNER
Lovell E. Pearch, Westlake, and Peter P. Surckis, Burton, Ohio, assignors to Rex-Radiant, Inc., Cleveland, Ohio, a corporation of Ohio
Filed Nov. 16, 1964, Ser. No. 411,357
21 Claims. (Cl. 239—426)

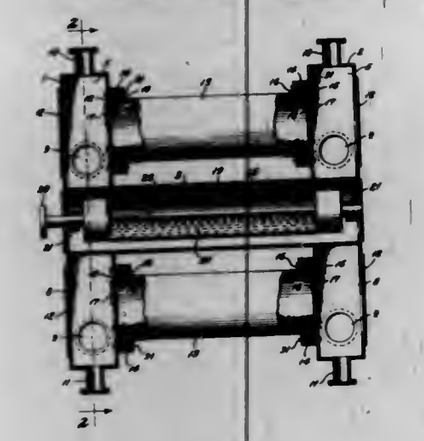


11. A gaseous fuel burner comprising:
a walled and partially confined combustion zone, said combustion zone being substantially much longer than wide and having a longitudinally extending open face,
gaseous fuel inlet means extending longitudinally along the length of said combustion zone and in that side thereof opposite said open face for introducing and distributing gaseous fuel in uniform quantities throughout the length of said combustion zone, and

air inlet means extending longitudinally along the length of said combustion zone and on both sides of said gaseous fuel inlet means and between said gaseous fuel inlet means and said open face of said

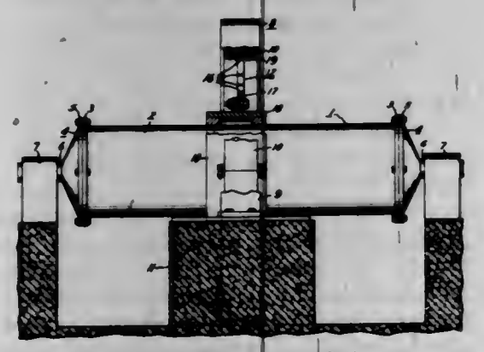
combustion zone for introducing and distributing air in uniform quantities throughout the length of said combustion zone and for thoroughly mixing air and gaseous fuel.

3,272,441
ASPIRATING SPRAY NOZZLE
Orvis A. Davis, Sr., Gibsonia, and Bruce R. Walsh, Wilkinsburg, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
Filed Nov. 3, 1965, Ser. No. 507,992
20 Claims. (Cl. 239—403)



1. A burner nozzle comprising axial swirl chamber means, second chamber means of substantially cylindrical configuration disposed forwardly with respect to said swirl chamber means, said swirl chamber means having at its forward end axial discharge orifice means with the surface of said discharge orifice means being curved and tapered outwardly in the direction of said second chamber means and being in unobstructed communication with said second chamber means for discharging a swirling distinctly conical oil spray from said swirl chamber means through said second chamber means without interference or obstruction and without substantial contact with said nozzle so that said conical oil spray aspirates a stream of air through said second chamber means from the rearward end to the forward end thereof, air passageway means open at one end to the exterior of said nozzle and open at the other end in the direction of said second chamber means for channeling air into said second chamber means, substantially flat surface means contiguous with said curved and tapered surface of said discharge orifice means lying on a plane substantially normal to the longitudinal axis of said nozzle extending laterally outwardly from said discharge orifice means and terminating with first flow deflecting means having first relatively sharp edge means facing said air passageway means in the region thereof near said second chamber means for inducing a vena contracta in said aspirated air stream downstream from said first sharp edge means and in the region of said oil spray, and second flow deflecting means having second relatively sharp edge means which is exposed to said air passageway means in the region thereof near said second chamber means and opposite from said discharge orifice means for inducing a vena contracta in said aspirated air stream downstream from said second sharp edge means and in the region of said oil spray, said cylindrical second chamber means having a diameter which is substantially greater than the length thereof and which is sufficiently large for the conical spray from the swirl chamber means to pass through without substantial contact with the walls of said second chamber means and for each air stream vena contracta to develop around said conical spray.

3,272,442
AEROSOL VALVE
Charles Robert Allenbach, Williamsville, Thomas A. Bradfield, Buffalo, Paul E. Gunning, Kenmore, and Donald R. Rink, Cheektowaga, N.Y., assignors to Union Carbide Corporation, a corporation of New York
Filed Jan. 16, 1964, Ser. No. 338,132
16 Claims. (Cl. 239—579)

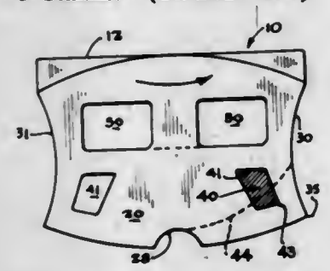


1. An aerosol valve particularly well suited for use with aerosol containers dispensing finely-divided solid materials which comprises, in combination, a tubular valve housing provided with a transverse apertured wall extending thereacross at the lower end of the housing; means for mounting the housing on an aerosol container; a resilient valve diaphragm having a central bore mounted so as to seal the upper end of the housing; a support means for the diaphragm mounted adjacent to and underlying the diaphragm; a valve stem mounted in the housing, having a top portion provided with a longitudinal conduit and a lateral stem opening, extending through and slidable in the bore of the valve diaphragm, and projecting beyond the container, an enlarged middle portion cooperating with the valve diaphragm to seal the container, and a bottom portion extending into the apertured wall of the housing to guide the stem against tilting; bias means within the housing urging the enlarged middle portion of the valve stem in a sealing relationship with the valve diaphragm; an eductor tube extending into the container, mounted on the apertured wall, and communicating with the valve housing; and an actuator button having a longitudinal passage provided with a discharge orifice and communicating with the longitudinal conduit of the valve stem; the lateral stem opening being normally located adjacent to the valve diaphragm so that a longitudinal movement of the valve stem against the bias means and from a normal sealing position to a discharge position causes the longitudinal conduit of the top portion to be moved into communication with the interior of the valve housing, and the effective inside diameters of the eductor tube, the stem opening, and the discharge orifice being of progressively increasing magnitude.

3,272,443
VIBRATORY MILL
Ewald Reiners, Hinsbeckerberg 44, Essen, Germany, and Erich Otters, Aachen, Germany (Friedenstr. 87, Duisburg, Germany)
Continuation of application Ser. No. 260,153, Feb. 21, 1963. This application Apr. 9, 1965, Ser. No. 448,574
Claims priority, application Germany, Feb. 22, 1962, S 78,163
16 Claims. (Cl. 241—153)

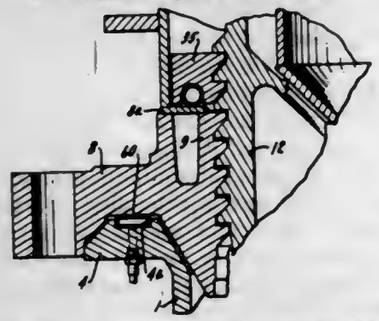
1. A vibrating mill including a plurality of generally parallel milling boxes arranged concentrically about a central axis, two end frames, the ends of the said milling boxes being positioned in and carried by the two said end frames, each end frame having a plurality of compartments therein, each compartment being in communication with a single one of the said plurality of milling boxes, and selectively in communication with each other, whereby the material milled can be selectively conducted to a neighboring milling box, such that the residence time of the material in the milling boxes can be chosen on the basis of the ultimate fineness desired, at least one inlet orifice on at least one end frame communicating with one of the said compartments, at least one outlet orifice on at least one end frame communicating with another of said compartments.

3,272,444
GEARLESS ROTARY MILL
Edward A. E. Rich and John J. Brockman, Schenectady, N.Y., assignors to General Electric Company, a corporation of New York
Filed Aug. 28, 1963, Ser. No. 305,076
6 Claims. (Cl. 241—176)



1. A relatively low speed gearless rotary mill adapted to minimize mechanical stresses which are induced within the rotor of a driving motor due to unequal thermal expansions and contractions within the rotor and mill members, comprising

a rotary mill comprising a rotatable receptacle for treating material in said receptacle while said receptacle is being rotated, and



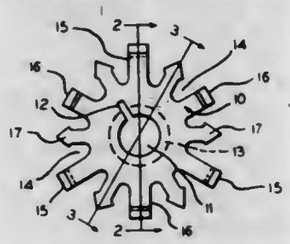
an electric motor having a rotor and stator, said stator being stationarily mounted, said rotor being spaced from said receptacle and resiliently supported therefrom whereby said receptacle is rotated by said motor through a resilient gearless driving arrangement which minimizes mechanical stresses that tend to be developed within the motor rotor due to unequal temperature conditions resulting from mill and motor operation.

3,272,445
REPLACEABLE HAMMER TIP FOR HAMMER MILLS
Ward W. Weller, 25 Benvenue St., Wellesley, Mass.
Filed Aug. 15, 1963, Ser. No. 302,411
5 Claims. (Cl. 241—197)

1. A replaceable hammer tip adapted to be secured in a hammer mill where coarse material is comminuted to a fine size by being struck by the hammer tip and by being thrown against the walls of the hammer mill, comprising a main body member having a top wall, a bottom wall, side walls and end walls; said end walls being the surfaces for striking the material being broken, said end walls having concave surfaces thereon for scooping the material and flinging the material against the side walls of the hammer mill, said bottom wall being of a convex configuration, said convex bottom wall extending across said body to said side walls to uninterrupted lower leading edges with the respective end walls, corners being formed by the intersection of said convex bottom wall and said concave surfaces of said end walls, said corners being less than 90°, said concave surfaces flaring upwardly and toward each other from said uninterrupted leading lower edges and then flaring upwardly and then outwardly from each other to form upper leading edges disposed substantially in the same planes as their respective lower leading edges.

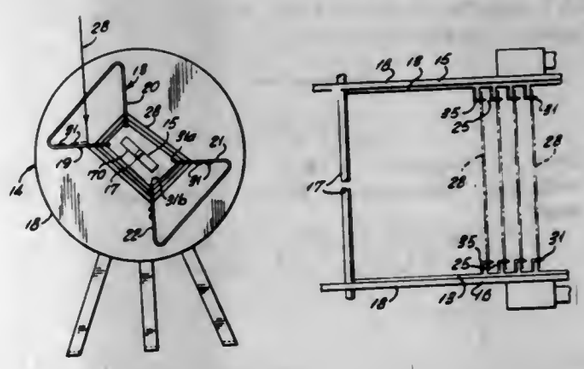
3,272,446
YIELDING BOWL LOCKING RING FOR CRUSHERS
Adolf Hesse, Milwaukee, Wis., assignor to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Apr. 1, 1965, Ser. No. 447,601
15 Claims. (Cl. 241—215)

1. In combination with a cone crusher having a circumferential frame, a bowl on said frame and a head and means for gyrating the head within the bowl, means for exerting pressure on crusher parts between the frame and the bowl including at least one tubular member of



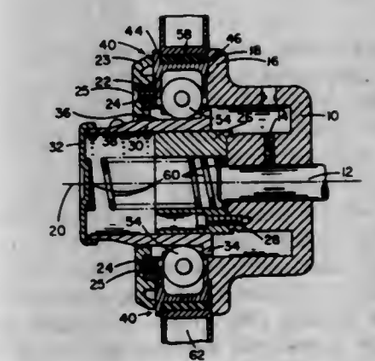
rubber or a suitable rubber substitute interposed between parts of the crusher, and means for supplying fluid pressure to the interior of such member and for thereby exerting pressure against crusher parts located between the frame and the bowl.

3,272,447
CHUCK FOR TUBULAR CORES
Alvin Lenwood Ewing and John Osborne Haw, Chester, and Roy Lee Terrell, Richmond, Va., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed June 23, 1964, Ser. No. 377,291
4 Claims. (Cl. 242—46.5)



1. An apparatus comprising a chuck adapted to receive a tubular core, said chuck comprising a spindle, a tubular housing rotatably mounted on said spindle, retainer means for holding the rotatable housing on the spindle, and certain types of annular rings mounted on said tubular housing including: (1) a first type being made of a relatively rigid but slightly depressible material and having an outside diameter substantially the same as the inside diameter of said tubular core; (2) a second type being made of a relatively compressible material having a relatively high coefficient of friction and having an outside diameter slightly greater than the inside diameter of said tubular core; and (3) a third type being made of a material capable of radial expansion due to centrifugal forces and having an outside diameter slightly less than the inside diameter of said tubular core.

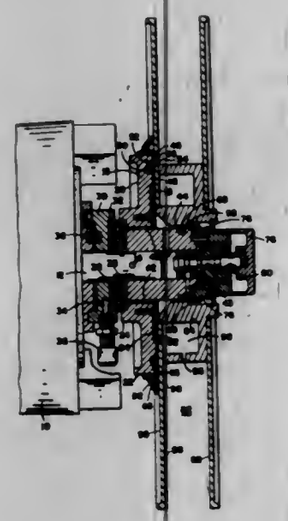
3,272,448
ROLL SUPPORT MOUNTINGS
Frank S. Caravella, 4321 N. 13th St., Milwaukee, Wis.
Filed Aug. 9, 1965, Ser. No. 478,060
4 Claims. (Cl. 242—55.2)



1. A sheet metal nut for associating the recess of a toilet paper holder with an attaching unit for a spirally wound spring that supports toilet paper, said attaching unit including a threaded portion for association with said spring member and a flange portion having a threaded portion, said flange portion being sized to engage the recess of said toilet paper holder and being sized to be held in operable position with respect to said toilet paper holder when the sheet metal nut is threadedly associated therewith, said recess having a bottom and ends defining the opening of said recess, said sheet metal nut comprising: a central aperture for operable association of said nut with said threaded portion of said flange portion, a plurality of outwardly extending engaging members including first engaging members, second engaging members and third engaging members, said first members extending outward and in one direction and being interposed between said attaching member and said recess to cause a friction fit therebetween when said nut is operably associated with said flange, said second engaging members extending outward and in an opposite direction to said first engaging members to frictionally abut against said recess when said nut is operatively associated with said flange, and said third attaching members extending outward and conforming to the contour of said flange when said nut is operatively associated with said flange, whereby said attaching member engages said recess for rigid association when said metal nut is operatively associated with said recess.

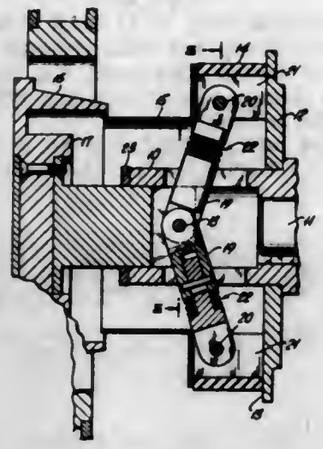
3,272,449
DEVICE FOR PACKING FABRIC
Sol Schwartz, 67—40 173rd St., Flushing, N.Y.
Continuation of abandoned application Ser. No. 248,694, Dec. 31, 1962. This application Apr. 9, 1965, Ser. No. 449,369
6 Claims. (Cl. 242—62)

5. A reel for winding pile fabrics comprising a radiating arm having a plurality of integral pliable spaced fabric hooks thereon on one side thereof, each of said hooks having a first non-interfering fabric position and a second fabric interfering position on said one side, said first position being arcuately spaced from said second position.



3,272,450
REEL SUPPORT
Robert A. Pendleton, Dedham, Mass., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Dec. 28, 1964, Ser. No. 421,362
8 Claims. (Cl. 242—68.3)

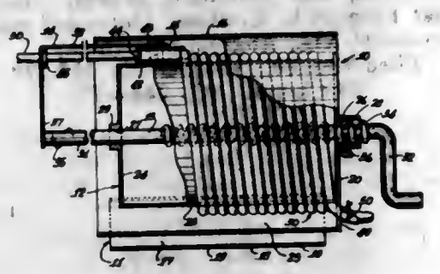
1. A reel mount comprising a hub including a hollow hub portion centered about a hub axis, a sleeve coaxially positioned within said hub portion and having a tapered outer surface, said sleeve terminating in a cap at its forward end and in a flange at its rearward end, guide means



permitting a sliding movement of said sleeve in an axial direction relative to said hub, a plurality of mutually spaced collet pieces surrounding said hub portion including discrete curved surfaces jointly defining a substantially circular coaxial periphery, each of said collet pieces having an extension slidingly protruding inward through a corresponding opening in the wall of said hub portion to permit movement of said collet piece in a radial direction, a roller rotatably disposed in each of said collet piece extensions and contacting said tapered sleeve surface, means for resiliently biasing said collect pieces radially inward, resilient means in contact with said sleeve cap for normally urging said sleeve in a forward axial direction until said sleeve flange abuts said collet piece extensions, said last recited resilient means being adapted to force a rising portion of said tapered sleeve surface beneath each of said rollers, said last recited action causing said collet pieces to move radially outward in opposition to said biasing means to expand the periphery defined by said curved surfaces, whereby the selective application of force to said sleeve cap in a rearward direction is adapted to contract said periphery below the inside diameter of a tape reel to be mounted.

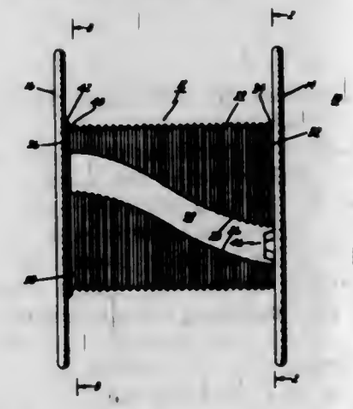
3,272,451
REEL SUPPORT
Robert A. Pendleton, Dedham, Mass., assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Dec. 28, 1964, Ser. No. 421,363
7 Claims. (Cl. 242—68.3)

4. A vacuum mount for transmitting power between a rotary source adapted to be fastened thereto and a removable reel, comprising a face plate coaxial with the axis of rotation and having forward and rear surfaces, means for applying vacuum pressure to said rear surface, at least one passage communicating between said surfaces to transmit said vacuum pressure, means on said forward surface adapted to engage said reel, a coaxial annular surface portion on said face plate positioned forward of said forward surface and including at least one annular groove, a compressible sealing ring disposed in said groove and normally rising above said annular surface portion, and a flexible annular rubber boot on said face plate concentrically surrounding said sealing ring, said boot including a lip terminating in an annular surface radially spaced from said annular surface portion and positioned forward of said sealing ring, said ring and said boot being adapted to engage a facing surface of said reel in fluid-sealing relationship upon the application of vacuum pressure.



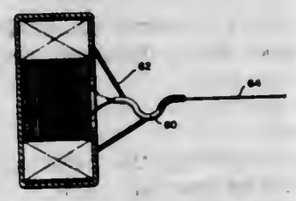
3,272,452
CONTRACTILE REEL HUB
Gerald D. Cohen, Massapequa, N.Y., assignor to Potter Instrument Company, Inc., Plainview, N.Y., a corporation of New York
Filed Nov. 12, 1963, Ser. No. 322,605
10 Claims. (Cl. 242—72)

1. A reel hub for a tape transport having a drive shaft for rotatably driving a tape reel having a cylindrical smooth walled central bore, said reel hub comprising support means adapted to be drivingly mounted on the outer end of said drive shaft for rotation therewith, expansible clutch means movably mounted on said support means for movement between contracted and expanded positions, said clutch means having an exposed surface of friction material which defines a cylinder in said expanded position having a diameter equal to the diameter of the central bore of the tape reel, hand-actuated over center lever means operatively connected to said clutch means for expanding and contracting said clutch means, the hand-actuated portion of said hand-actuated over center lever means being exposed on the outer end of said reel hub and being disposed entirely within the cylinder defined by said friction surface when said clutch means is in its contracted position to enable said tape reel to be slipped over the outer end of said reel hub onto said cylinder without interference, means for stopping said hand-actuated over center lever means after it snaps over center in said expanded position, and resilient means for resiliently biasing said friction clutch means radially outward to facilitate the over center snap action and to urge said friction surface against the wall of said central bore and said hand-actuated over center lever means against said stop means to maintain said clutch means in its expanded position until said hand-actuated portion is manually gripped and actuated in the opposite direction to contract the clutch means.



3,272,453
LINE STORAGE REEL
Goldwin M. T. Hallock, Box 276, Fenelon Falls, Ontario, Canada
Filed Feb. 24, 1965, Ser. No. 434,846
Claims priority, application Canada, Jan. 21, 1965, 921,310
11 Claims. (Cl. 242—86)

1. A line storage device comprising a stationary drum member having a line receiving outer surface, a shaft mounted for rotation coaxially within said drum member, said shaft having a portion extending outwardly beyond one end of the drum member, means for axially shifting said shaft upon rotation of said shaft, a line carrier arm fixed to said end portion of said shaft and having a portion extending over said outer surface of said drum member, and a line guide means carried by said portion of said arm juxtaposed said surface and having a curved line engaging surface for directing the line to a substantially tangential line with respect to said surface of the drum,

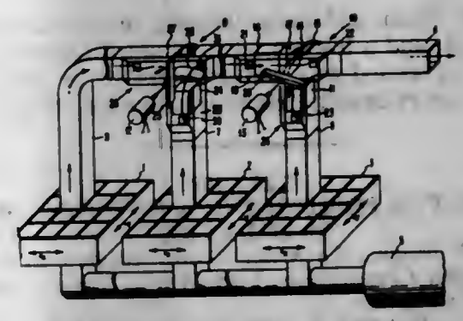


whereby the line is fed spirally onto said surface of the drum on rotation of said shaft.

3,272,454
WIRE SPOOL
Harrison R. Lane, Fort Wayne, and George G. Tucker, Auburn, Ind., assignors to Universal American Corporation
Filed July 22, 1963, Ser. No. 296,582
18 Claims. (Cl. 242—117)

1. A spool for precision layer winding of wire comprising a barrel portion and a pair of head portions respectively at opposite ends of said barrel portion, said barrel portion having a plurality of part-annular grooves formed therein for respectively positioning the convolutions of the first layer of wire on said spool, the respective ends of said grooves being circumferentially spaced-apart, said spaced-apart ends defining a helically extending groove for accommodating the cross-overs of the wire of said first layer between adjacent convolutions.

3,272,455
WIRE COIL
Huot W. Sternberg, Bridgeport, and Harry G. Robinson, Stratford, Conn., assignors to American Chain & Cable Company, Inc., New York, N.Y., a corporation of New York
Filed Feb. 17, 1965, Ser. No. 437,619
3 Claims. (Cl. 242—171)



1. In a wire package which includes an annular container and a coil of wire disposed therewithin in a multiplicity of overlying convolutions pressing outwardly against the container and having substantially one elastic back twist per convolution permitting axial withdrawal

of the wire from the container free of net torsional deformation, means for preventing transmission of torsional forces from withdrawn portions of the wire back to convolutions remaining in the container comprising

(a) exit guide means mounted on the container to initially guide the withdrawn portion of the wire along the axis of the container, then in a curved path away from and then back along the container axis,

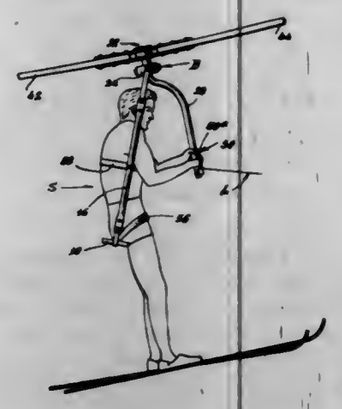
(b) said curved path being fixed with respect to the container and differing from any free path otherwise taken by the wire when axially withdrawn from the container without engaging the exit guide means.

3,272,456
PNEUMATIC CARRIER SELECTOR VALVE, DECELERATOR AND HOLD MECHANISM
Henry G. Hoehmann, Los Gatos, Calif., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 10, 1964, Ser. No. 388,377
5 Claims. (Cl. 243—29)

1. A switching apparatus for use in an information handling system wherein a main channel is to be selectively, pneumatically and mechanically coupled to two subchannels, said switching apparatus comprising:

a main switch channel adapted to be connected to said main channel,

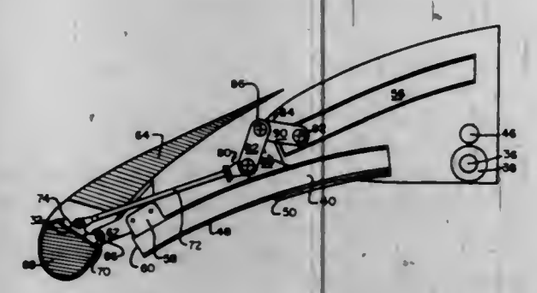
first and second switch subchannels adapted to be connected to said two subchannels,



means for selectively, mechanically and pneumatically connecting a switch subchannel to said main switch channel while mechanically and pneumatically blocking the other switch subchannel from said main switch channel, and

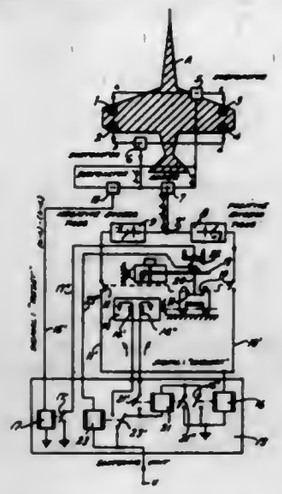
a pneumatic bypass to said main switch channel from said blocked switch subchannel.

3,272,457
WATER SKI AUTOGYRO
Donald B. MacMillan, Candlewood Shores, Brookfield, Conn.
Filed July 1, 1964, Ser. No. 379,532
7 Claims. (Cl. 244—17.11)



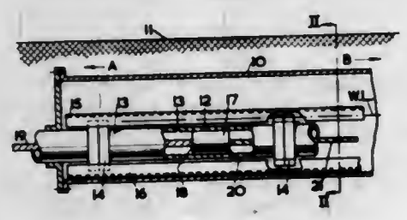
4. A towable lifting device for water-skiers which comprises: a generally rectangular framework including a seat member, right and left side members extending upwardly from said seat member, and an upper cross member interconnecting said side members; a right rotor support member extending upwardly and inwardly from said right side member to an upper end; a left rotor support member extending upwardly and inwardly from said left side member to an upper end, the upper ends of said right and left rotor support members extending vertically in spaced parallel relationship to one another; a gimbal ring pivotally mounted between the second ends of said rotor support members for rotation about a first axis substantially parallel to the plane of said rectangular framework; a control stick pivotally mounted within said gimbal ring for rotation about a second axis substantially normal to said first axis, a first end of said control stick extending

above said gimbal ring and a second end of said control stick depending below said gimbal ring; rotatable thrust bearing means mounted on said first end of said control stick; a plurality of elongated air foil means extending



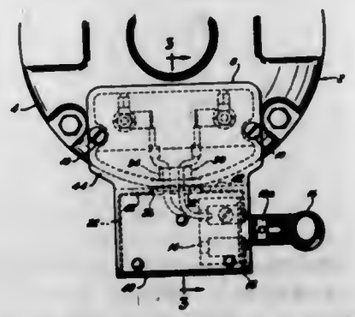
outwardly from said thrust bearing means for rotation thereabout; and a towline latch mounted on said control stick at its second end and arranged to be grasped by the user for releasably retaining a towline therein.

3,272,458
MEANS FOR POSITIONING A ROTATING WING SLAT DEVICE
Bruno W. Bracka, La Mesa, Calif., assignor to General Dynamics Corporation, Fort Worth, Tex., a corporation of Delaware
Filed Dec. 8, 1964, Ser. No. 416,865
9 Claims. (Cl. 244—42)



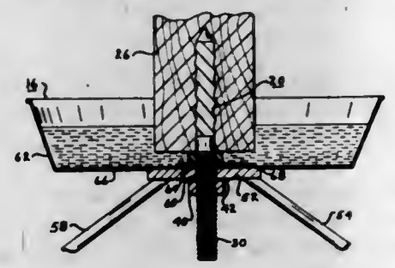
1. In an airfoil construction of the class wherein a composite airfoil structure is comprised of not less than two airfoil components, the first of which when fully retracted is superimposed upon the leading edge portion of the second in such a manner that an essentially new aerodynamically clean composite airfoil configuration is created, and when extended (forwardly and downwardly) defines still other airfoil configurations, each having aerodynamically useful slats for varying airflow over and about said second airfoil, the improvement comprising:
a mechanical linkage means operable for extending the first airfoil forwardly and downwardly in respect to the second airfoil along a predetermined trajectory sequentially and simultaneously causing said first airfoil to vary in camber and chord in such manner as to provide increased high-lift airflow and inversely for retraction of the first airfoil to the superimposed position, said means comprising in part at least one pair of trajectory establishing support means, at least one of said support means movable relative to the other to establish and define the trajectory of the first airfoil, and a connecting means responsive to relative movement of said support means operative to cause rotation of at least a portion of the first airfoil.

3,272,459
FLIGHT CONTROL ARRANGEMENT
Gero Madelung and Leonhard Bräuer, Munich, and Benedikt Emmerich, Krailling, Germany, assignors to Messerschmitt AG., Augsburg, Germany
Filed Mar. 10, 1964, Ser. No. 350,799
19 Claims. (Cl. 244—77)



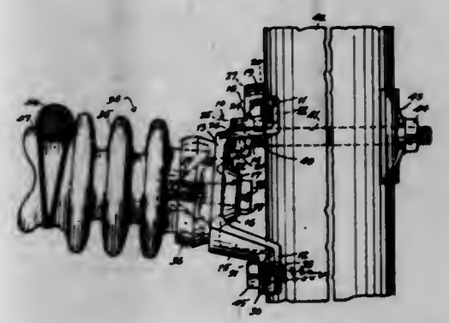
17. An arrangement for controlling the flight regulator of a VTOL aircraft having a plurality of jet propulsion means, comprising in combination, flight regulator operating means; limiter means for normally limiting the range of regulation of said operating means to a normal range; detector means cooperating with said propulsion means to produce an electrical control signal at an operational condition of said propulsion means requiring regulation of said operating means beyond said normal range; and control means controlled by said control signal for inactivating said limiter means so that the range of regulation of said operating means is increased.

3,272,460
ARRESTER GEAR FOR AIRCRAFT
John Thomlinson, Bedford, England, assignor to the Minister of Aviation in Her Majesty's Government of the United Kingdom of Great Britain and Northern Ireland, London, England
Filed Dec. 31, 1964, Ser. No. 422,731
Claims priority, application Great Britain, Jan. 2, 1964, 171/64; July 10, 1964, 28,538/64
14 Claims. (Cl. 244—110)



1. An arrester gear for aircraft comprising
a perforated tube, the perforations being distributed lengthwise of the tube,
a piston within the tube,
an arrester cable,
support means supporting the cable across the path of an aircraft to be arrested,
connecting means operatively connecting the arrester cable to the piston,
a housing enclosing the perforated tube,
liquid contained within the housing and in which the perforated tube is submerged, and wherein upon arresting engagement of an aircraft with the arrester cable the piston is drawn along the tube and a braking effect is achieved by the expulsion of liquid from the perforated tube through the perforations in it and the liquid is retained in the housing.

3,272,461
SWITCH MOUNTING STRUCTURE
Robert E. Larkin, Waukesha, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Filed Mar. 9, 1965, Ser. No. 438,345
5 Claims. (Cl. 248—27)

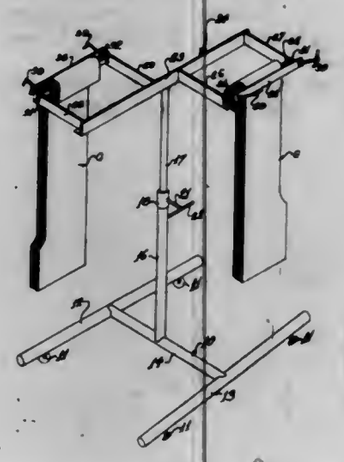


1. For mounting an enclosed electric switch unit on a device having an aperture extending through a wall thereof, the combination with a switch enclosure having a frame and cover member, said frame having an aperture arranged to be in corresponding alinement to that in the device, of attaching and securing means comprising a grommet for penetrating and seating in the alined apertures of the frame and the device, said grommet having a collar seating against a wall adjacent the periphery of one of said apertures and having resilient portions which overlie and grip a wall adjacent the periphery of the other of said apertures which is opposed to the wall first mentioned when said grommet is seated, and further comprising means in engagement with said enclosure and said device to prevent rotational movement of the switch unit about said grommet.

3,272,462
TREE HOLDING DEVICE
Garold E. Apple, R.R. 4, Plymouth, Ind.
Filed Sept. 24, 1964, Ser. No. 399,112
3 Claims. (Cl. 248—44)

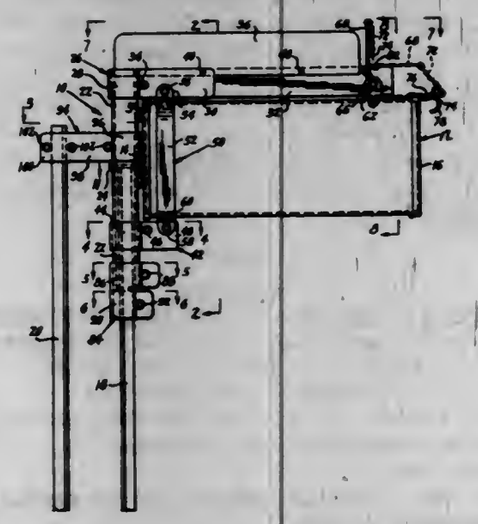
1. A Christmas tree display device and stand, comprising a base having a relatively large ring member, a disc-shaped plate at the center of said ring member positioned on an elevated plane and having a vertically positioned hole therein, equally spaced arms connecting said plate and ring member to form a rigid structure therewith, a water receptacle seated on said plate and having a flat bottom with a center hole therethrough in alignment with the hole in said plate, the central area of said bottom around the hole therein being supported and reinforced by said plate, a vertically positioned shaft removably secured to said plate in said hole and having each end threaded, the threads on the upper end having a greater pitch than the threads on the lower end, a washer-like gasket on said shaft above said plate, a nut threaded onto the threads of the lower end of said shaft to a point near the middle thereof and being seated on said gasket, a washer on said shaft below said plate, and a nut on said shaft engaging said washer for securing said shaft to said plate and for clamping said plate and receptacle together and securing said shaft in said holes in an upright position and in a water-tight relationship with said receptacle.

3,272,463
INSULATOR BRACKET
Donald R. Greig, Branford, Conn., assignor to Malleable Iron Fittings Company, Branford, Conn., a corporation of Connecticut
Filed Nov. 3, 1964, Ser. No. 408,625
6 Claims. (Cl. 248—65)



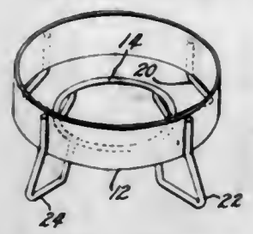
1. An insulator bracket, for mounting an insulator upon a utility pole wherein said insulator includes an insulation body, a base supporting said body having an exposed bearing surface, and a headed securing bolt projecting from said base with its axis substantially central and normal to said bearing surface; said bracket comprising a forward wall portion presenting a forward bearing face for engagement by the bearing surface of said insulator and having a bolt-receiving hole extending therethrough to a rearward bearing face parallel to said forward bearing face and laterally clear of obstructions at each side for receiving said bolt with its head bearing upon said rearward bearing face, top and bottom wall portions extending rearwardly from the upper and lower ends of said forward wall portion in laterally clear relation to said rearward bearing face and defining therewith a wrench space opening to each side of said bracket for wrench manipulation of said bolt, upper and lower pole-engaging pad portions respectively extending upwardly and downwardly from the rearward ends of said top and bottom wall portions, and through-bolt-receiving means including an upright transversely disposed wall portion formed with a through-bolt-receiving hole opening to the rearward side of said upper pad portion and having a forwardly facing bearing surface surrounding said hole for bearing engagement of a bolt head.

3,272,464
BUNDLE HOLDER FOR GARMENT PIECES
Milton D. Jacobson, 2301 1st Ave. N., Birmingham, Ala.
Filed Feb. 16, 1965, Ser. No. 433,043
2 Claims. (Cl. 248—125)



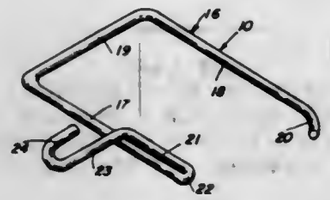
1. In a bundle holder for supporting garment pieces during the manufacture of garments,
(a) a translatable frame,
(b) a first upstanding tubular member carried by said translatable frame,
(c) a second tubular member telescopically engaging said upstanding tubular member and adapted for rotation relative thereto,
(d) means limiting movement of the tubular members relative to each other, whereby said tubular members are held at selected positions relative to each other to vary the elevation of said second tubular member,

(e) an elongated member extending in a horizontal plane and connected intermediate its ends to the upper end of said second tubular member and disposed to rotate therewith,
(f) a first pair of parallel arms extending outwardly from one end of said elongated member in spaced relation to each other,
(g) a second pair of parallel arms extending outwardly from the other end of said elongated member in spaced relation to each other,



(h) supporting bars carried by said parallel arms in spaced relation to each other in position to support garment pieces,
(i) there being upwardly opening slots adjacent the outer ends of said parallel arms in position to receive said supporting bars whereby a supporting bar is adapted to be supported between each pair of parallel arms, and
(j) clamping means cooperating with said supporting bars to detachably clamp garment pieces therebetween.

3,272,465
SWINGABLE MAILBOX STRUCTURE
Eli J. Baarsgard, Mabel, Minn.
Filed Dec. 29, 1964, Ser. No. 421,937
7 Claims. (Cl. 248—145)

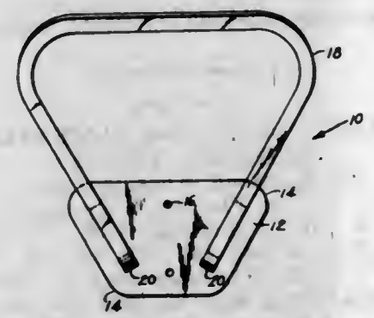


1. A mailbox support comprising an elongated post, an elongated tubular pipe telescopically engaged over said fence post, means in said pipe engaging the upper end of said fence post for limiting the penetration of said fence post in said pipe, a first support member, with a circular clamp and two horizontal straps secured to said pipe, a second support member with a circular clamp and two horizontal straps secured to said pipe and spaced below said first support member, a mailbox, and vertical band means encircling said mailbox and having upper and lower ends secured to said first and second support member straps respectively.

3,272,466
LITTER BARREL MOUNT
David A. Sherman, 1613 S. 8th St., Monroe, La. 71202
Filed Oct. 1, 1965, Ser. No. 492,111
3 Claims. (Cl. 248—146)

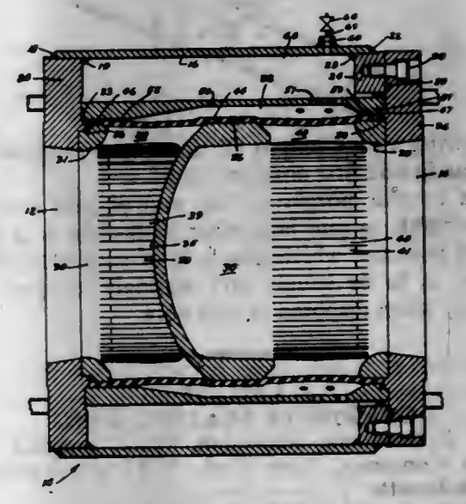
1. A litter barrel mount comprising a sheet metal hoop of cylindrical construction adapted to extend about a peripheral portion of a base of a latter barrel for supporting it, a supporting metal concentrically disposed element hoop of smaller diameter than said aforementioned hoop and adjacent a lower edge for fitting under the litter barrel, a series of J-shaped metal brace members spatially disposed in sectored relation about said foregoing hoops for maintaining the spacing of the pair of hoops and supporting a litter barrel in forming a litter barrel mount.

3,272,467
PAIL SUPPORTING DEVICE FOR LADDERS
William C. Kassube, 1337 Fargo, Chicago, Ill.
Filed Nov. 10, 1964, Ser. No. 410,175
2 Claims. (Cl. 248—211)



1. A pail supporting device for use with ladders of the type which includes spaced parallel ladder rails having transversely extending rungs extending therebetween and connected thereto, and in which each of said ladder rails includes substantially parallel inner and outer side wall surfaces and substantially parallel front and rear end wall surfaces, said pail supporting device comprising
(a) a generally U-shaped body member including
(b) spaced substantially parallel arms interconnected by a bight portion extending therebetween and defining a plane, one of said arms having
(c) a reversely bent portion bent back upon itself and extending substantially parallel thereto above the said one arm, said reversely bent back portion having
(d) an offset end portion extending generally rightangularly therefrom between the ends of the said one arm and laterally away from the latter, said offset end portion terminating in
(e) a hook-shaped element formed by an integral part of the said laterally extending offset portion and lying above said one arm of said generally U-shaped body member and the other one of said arms terminating in an angled end portion.

3,272,468
SUPPORT BRACKET FOR PERFORATED BOARDS
Edward Wittrock, Hartley, Iowa
Filed Mar. 30, 1965, Ser. No. 443,963
6 Claims. (Cl. 248—225)

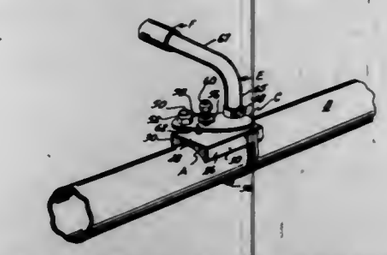


1. In a support bracket,
a first bracket member having an elongated shank and a head portion offset rearwardly therefrom which is adapted to be detachably received by one aperture in a sheet member having a plurality of apertures formed therein,
a second bracket member having an elongated shank and a head portion offset rearwardly therefrom which is adapted to be detachably received by another of the apertures in the sheet member,
and a sleeve means embracing said shanks and extending therebetween,
at least one of said first and second bracket members having a hook member extending forwardly therefrom.

3,272,469
TOWEL RACK
Orval L. Doty, 301 E. Falletti, Claremore, Okla.
Filed Nov. 27, 1964, Ser. No. 414,266
1 Claim. (Cl. 248—309)

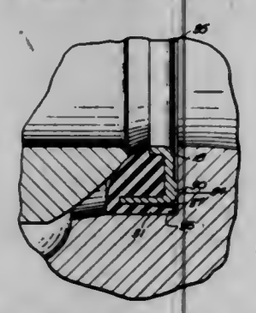
A towel rack comprising, in combination, a flat base member providing means for securing to a vertical surface, a towel support member of square cross-sectional configuration carried by said base member providing means for spreading thereupon and suspending therefrom a towel, said base tapering at its lower extremity, the corners of said base being rounded to prevent injury when a towel is placed upon said rack, said means comprising a pair of spaced apart openings for receiving suitable fasteners to secure said base to a wall so to suspend a towel from said rack, and when a towel is placed upon said towel support member said towel rack being no longer visible, said towel support member being substantially triangular in frontal configuration, providing a means for spreading a towel so that air may circulate under a towel as well as on the outside of a towel when a towel is supported on said towel support member, legs being formed by lower extremity of said towel support member and being arcuately curved upwardly and the outer extremities of said legs being secured to said base by spot welding, and the upper extremity of said towel support member being angularly positioned in relation to said base, allowing said towel to depend downwardly away from said base.

3,272,470
FLUID FLOW CONTROL DEVICE
Austin U. Bryant, Walnut Creek, Calif., assignor to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Filed Feb. 6, 1964, Ser. No. 342,910
5 Claims. (Cl. 251—61)



1. A valve construction comprising:
a housing having inlet and outlet flow passages,
a circular barrier having a peripheral cylindrical sealing surface secured within said housing intermediate said flow passages,
an expansible sleeve in sealed communication at opposite ends thereof to said flow passages and snugly embracing the cylindrical sealing surface of said barrier,
a rigid sleeve surrounding said expansible sleeve in closely spaced relationship thereto so that the inner surface of said rigid sleeve limits radial expansion of said expansible sleeve,
said rigid sleeve having at least one aperture therethrough, having a total flow capacity restricted sufficiently so as to control the rate of movement of said expansible sleeve preventing chatter and being mounted in said housing with portions thereof in spaced relationship to said housing to form a fluid chamber of substantial volume within said housing around said rigid sleeve, and,
means for introducing a compressible pressure fluid into one of said rigid sleeve and said chamber.

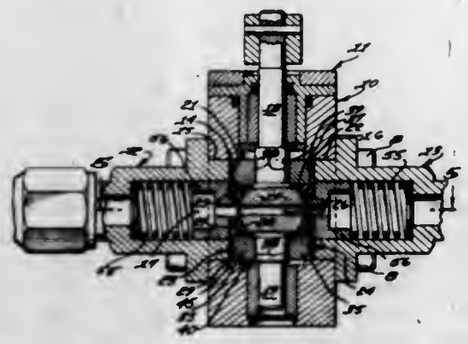
3,272,471
QUICK COUPLING VALVE
Floyd McCullah, 9111 Holder Road, Cypress, Calif.
Filed Apr. 14, 1964, Ser. No. 359,574
9 Claims. (Cl. 251—146)



1. A quick coupling valve for use in effecting fluid communication between a hose and a tubular header in the upper portion of which header an opening is formed, including:
(a) a resilient valve body that rests on the upper surface of said header, said body having a bore extending downwardly therethrough, with said bore being in axial alignment with said opening in said header;
(b) a rigid member that at least partially covers the upper surface of said valve body;
(c) first means for holding said valve body on said header, with said bore and opening being in said axial alignment;

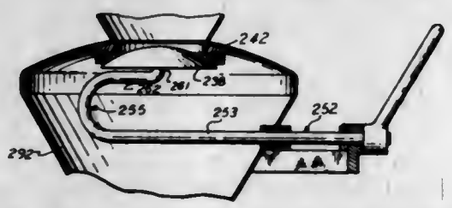
(d) a valve plate;
(e) second means for so pivotally supporting said plate from said rigid member that said plate can be moved to a first position where said plate cooperates with said body to seal the upper end of said bore, and to a second position where the upper end of said bore is unobstructed;

(f) spring means that at all times tend to maintain said plate in said first position; and
(g) a tubular nozzle on one end of said hose that is insertable in said bore when said plate is in said second position, which nozzle is of such external diameter as to be snugly and sealingly gripped by said body when disposed in said bore.



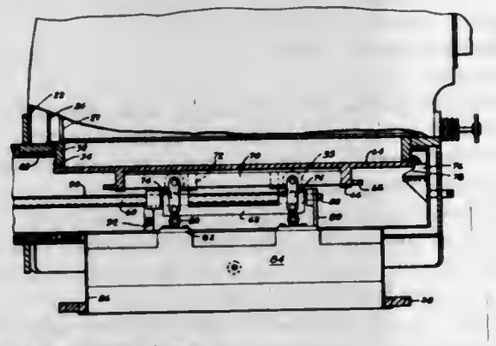
3,272,472
COMPOSITE SEALING RING
Edward J. Goldman, Randolph, Mass., assignor to Walworth Company, New York, N.Y., a corporation of Massachusetts
Original application, Feb. 19, 1962, Ser. No. 174,052. Divided and this application June 9, 1965, Ser. No. 467,178
3 Claims. (Cl. 251—172)

1. A composite sealing ring adapted to be inserted in a cylindrical recess of one cooperating member for sealing with another cooperating member, said sealing ring comprising a metal backing ring U-shaped in cross section and having an inner and outer peripheral rib with a groove therebetween, the outer rib being substantially cylindrical and longer than the inner rib, and an elastic compressible sealing member having a body in the groove of the backing ring and a flange projecting outwardly away from the outer rib of the backing ring, said flange being disposed to make sealing contact with and to be forced radially inwardly of the ring by surrounding surfaces defining the recess in the one cooperating member in which it is inserted, said sealing member having a face exposed in front of the groove in position to provide contact and sealing with the other cooperating member.



3,272,473
SPHERICAL VALVE HAVING ENCAPSULATED SEAL MEANS
Herbert F. Veit and William R. Day, Fullerton, Calif., assignors to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware
Filed Mar. 4, 1963, Ser. No. 262,613
11 Claims. (Cl. 251—174)

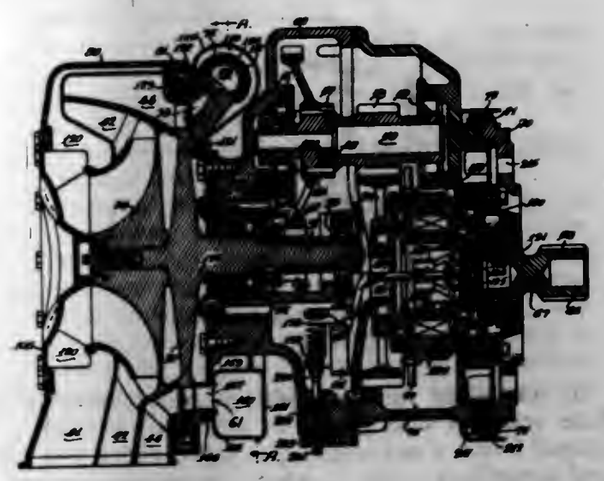
1. In a valve assembly, the combination comprising a casing having a passageway formed therethrough;
a valve plug of spherical configuration having a bore extending therethrough rotatably mounted within said passageway and adapted to move from a position wherein the bore is out of alignment to a position wherein said bore is in alignment with said passageway;
seal retainer means comprising a pair of juxtaposed half shell members provided with a hemispherical surface corresponding to and closely fitting the spherical surface of said valve plug and having bores located coaxial with the flow passageway of said casing,
said seal retainer members further including a shallow cylindrical chamber formed in the face opposite said hemispherical surface;



sealing means retained by said seal retainer means comprising a pair of annular elements each having a first portion located within the bore of said seal retainer means and a diametrically enlarged integral second portion located within the shallow cylindrical chamber of the associated seal retainer means,
said first portion having a face provided with a hemispherical surface corresponding to and sealingly engaging the spherical surface of said valve plug;
means provided by said casing abutting the diametrically enlarged portion of said sealing means so as to rigidly clamp said portion between said casing and said seal retainer means; and
means for urging said sealing means against said valve plug.

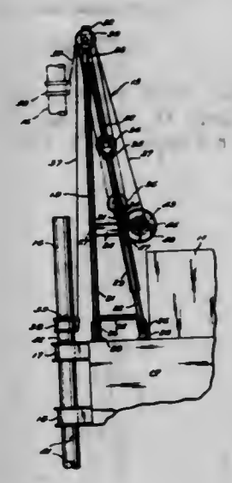
3,272,474
SHUT-OFF VALVE FOR CEMENTITIOUS PRESSURE VESSELS
George M. Pro, Leawood, Kans., assignor, by mesne assignments, to Air Placement Equipment Co., Inc., Grandview, Mo., a corporation of Massachusetts
Original application Dec. 18, 1958, Ser. No. 781,322, now Patent No. 3,090,593, dated May 21, 1963. Divided and this application Apr. 16, 1963, Ser. No. 273,386
5 Claims. (Cl. 251—175)

5. In a machine for handling particulate material, the combination of a pressure hopper for said material having a material inlet port and a circular, resilient seat in the hopper adjacent the port; a valve in the hopper having a convex outer face shaped substantially in conformity with a sector of a sphere, said outer face normally bearing against the seat in closing relationship to the port; and resilient support means coupled with the valve and including a shaft rotatably carried by the hopper and supporting the valve for movement to and from a position opening said port as said shaft is rotated, said support means flexing in response to pressure in the hopper and mounting the valve for movement toward the seat to compress the latter when the valve is closed, whereby said pressure in the hopper holds the valve tightly against said seat, the support means returning the valve to a disposition out of substantial compressing engagement with the seat in the absence of said pressure, whereby to minimize drag or friction between the seat and the valve during movement of the latter to the open position when the hopper is depressurized.



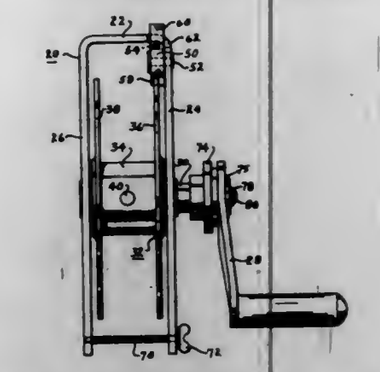
3,272,475
FLEXIBLE GATE VALVE HAVING LOAD BEARING MEANS
Austin U. Bryant, Walnut Creek, Calif., assignor to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Filed Feb. 8, 1963, Ser. No. 257,141
5 Claims. (Cl. 251—203)

1. A valve comprising:
a valve body,
a flow passageway through said valve body,
an annular valve seat surrounding said flow passageway,
a generally circular, flexible valve plate,
an annular load transmitting member of a diameter smaller than said valve seat and valve plate secured coaxially to said valve plate,
a motion transmitting member,
means connected to said motion transmitting member to produce movement thereof to carry said valve plate into and out of alignment with said valve seat, and
means connecting said motion transmitting member and said load transmitting member and operated in response to movement of said motion transmitting member when said valve plate is moved into alignment with said valve seat to urge said load transmitting member toward said valve seat and force said valve plate into firm engagement with said valve seat.



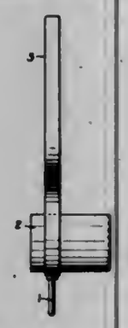
3,272,476
ENGINE STARTER
Augustus C. Durdin, Rockton, and Bernard Kittle and Stephen S. Beitz, Rockford, Ill., and Donald F. Swenski, Arvada, Colo., assignors to Sundstrand Corporation, a corporation of Illinois
Original application Aug. 30, 1960, Ser. No. 52,845. Divided and this application Dec. 18, 1964, Ser. No. 422,066
9 Claims. (Cl. 253—59)

1. A gas and air propelled engine starter for producing self-sustaining engine rotation comprising a main shaft, turbine wheel means mounted on said shaft, an output shaft driven by said main shaft adapted to be connected to drive said engine, air nozzle means for directing compressed air against said turbine wheel means for rotation thereof, combustion gas nozzle means for directing hot gases against said turbine wheel means for rotation thereof, and a drag fan operatively connected to said main shaft separate from said turbine wheel means for preventing rotation of said turbine above a predetermined speed, said drag fan having inlet ducting means connected to a source of constant low pressure fluid and



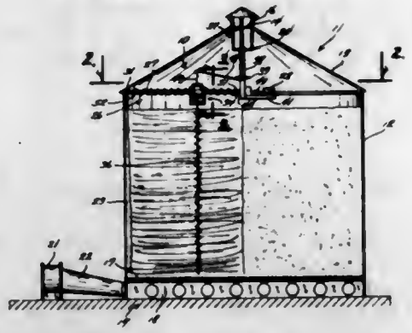
having outlet ducting means connected to a constant low pressure receiver so that the load imposed on the turbine wheel is a function substantially of only the speed of the turbine wheel.

3,272,477
HYDRAULIC SPUD LIFTING ARRANGEMENT FOR DREDGES
Fred J. Schmidt, Baltimore, Md., assignor to Ellicott Machine Corporation, Baltimore, Md., a corporation of Maryland
Filed Apr. 16, 1964, Ser. No. 360,333
14 Claims. (Cl. 254—93)



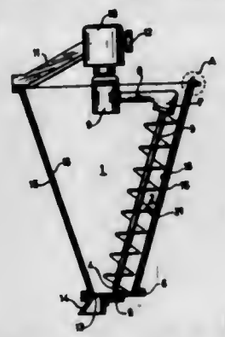
1. A dredge comprising a hull; a spud mounted for generally vertical movement relative to said hull; a hoist on said hull having a cable operatively connected to said spud to control the vertical position of said spud; said hoist including winding means operatively engaging said cable operable to release cable, take in cable and lock to prevent both release or taking in of cable, said winding means including drive means for automatically applying tension to said cable at all times when it is unlocked to release cable or take in cable; and a linear power actuator operatively connected to said cable operable in one direction to raise said spud when said winding means is locked.

3,272,478
ANCHOR REEL
Clem C. Binns, Niles, Mich.
(% Cass Tool & Die, Cassopolis, Mich. 49031)
Filed June 8, 1964, Ser. No. 373,192
4 Claims. (Cl. 254—186)



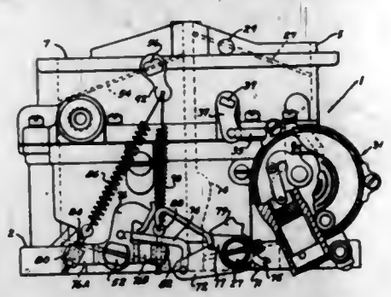
1. An anchor reel comprising a unitary assembly of a base and two sides joined to said base forming a U-shaped frame, a reel assembly mounted within said frame and comprising a hub, a wheel concentric with and integrally connected to one end of said hub, and a ratchet wheel concentric with and integrally connected to the other end of said hub, one of said frame sides being movable toward and away from said hub on opposite sides thereof a shaft extending concentrically from said hub and passing through one of said sides, a handle connected to said shaft for free rotation with respect to said assembly, keying means on said handle, cooperating keying means on said shaft, a spring on said shaft acting between said handle and said frame to bias said handle away from said second mentioned keying means, a pawl resiliently biased into latching contact with said ratchet wheel, frictional means interposed between one of said wheels and the adjacent side wall, and means for urging said last mentioned side wall and said last mentioned wheel into closer contact with said frictional means.

3,272,479
TOOL
Gerard Feltgen, 6908 Fairfax Road, Bethesda, Md.
Filed July 31, 1964, Ser. No. 386,795
8 Claims. (Cl. 259—73)



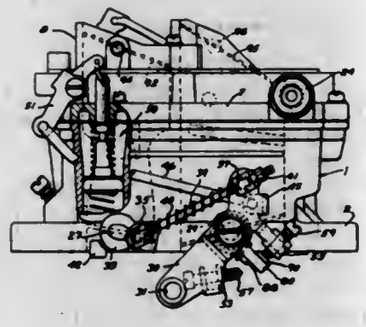
1. A device for facilitating the manual agitation of liquid containers such as paint cans and the like comprising a cradle for holding the container in a generally horizontal position, a support rigidly connected to and projecting from the bottom of the cradle, said support having means at its lower end adapting it to accommodate substantial universal pivotal movement of said support and cradle about the lower end of said support, and an actuator arm fixed to and projecting upwardly from said cradle whereby said actuator arm may be manipulated to impart rapid oscillatory pivotal motion to said entire device and any container resting in said cradle about an axis through the lower end of said support to thereby agitate the contents of such a container.

3,272,480
METHOD AND APPARATUS FOR AERATING STORED GRAIN
Eugene G. Sukup, Dougherty, Iowa, assignor to Sukup Manufacturing Co., Sheffield, Iowa, a corporation of Iowa
Filed Oct. 26, 1964, Ser. No. 406,385
9 Claims. (Cl. 259—111)



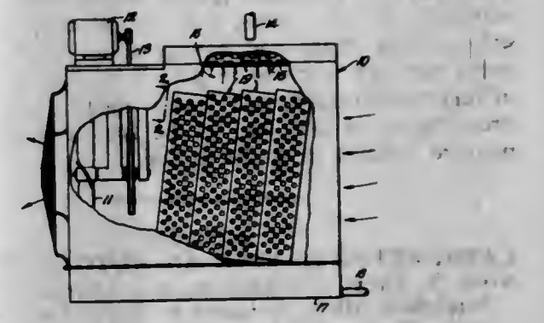
1. A grain moving apparatus for operation within a grain bin having a roof and enclosed by a wall, said apparatus comprising in combination:
rotatable means including a vertically disposed, rotatable auger;
conveyor means for providing sole support for said rotatable means, said conveyor means rotatable about its longitudinal axis to move said rotatable means radially back and forth within the bin;
friction means operably connected to said conveyor means and to the bin wall for effecting horizontal movement of said conveyor means in a circular direction about the bin; and
support means attached to the bin roof and rotatably supporting said conveyor means for movement in a horizontal plane.

3,272,481
MIXING DEVICES
Constant J. Nauta, Bloemendaal, Netherlands, assignor to Nautamix N.V., Haarlem, Netherlands
Filed July 7, 1964, Ser. No. 380,830
Claims priority, application Netherlands, July 12, 1963 295,226; Apr. 9, 1964, 6,403,850
4 Claims. (Cl. 259—111)



1. In a mixing device having at least one mixing vessel with a side wall of circular cross-section and a bottom, at least one mixing element disposed in said vessel with the longitudinal axis of said element extending parallel to said side wall, means mounting said element for revolving about the longitudinal axis of the vessel in close proximity to said side wall, and drive means for effecting said revolving of said mixing element; said side wall comprising a closed rigid outer casing and a closed elastic inner casing joined together in a fluid-tight manner at their upper and lower edges to define a space therebetween, and valve means carried by said side wall and communicating with said space so that the pressure in said space may be varied through said valve means to cause the movement of said elastic inner casing toward and away from said mixing element.

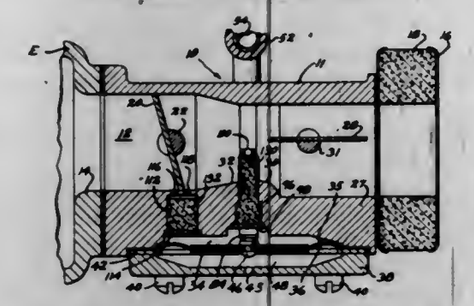
3,272,482
AIR VALVE SECONDARY CARBURETOR
Harold A. Carlson, St. Louis, Mo., assignor to ACF Industries, New York, N.Y., a corporation of New Jersey
Filed May 6, 1965, Ser. No. 453,711
5 Claims. (Cl. 261—23)



1. A multi-stage carburetor comprising a body structure having a primary mixture conduit and a secondary mixture conduit for the flow of an air and fuel mixture therethrough, means including a primary nozzle for providing fuel flow into the said primary conduit, a secondary nozzle for providing fuel flow into the said secondary conduit, manually operable means including a primary throttle and a secondary throttle movably mounted respectively within said primary and secondary conduits and downstream respectively of said fuel nozzles for controlling the flow of air-fuel mixture therethrough, a control valve within said secondary conduit upstream of said secondary fuel nozzle, means eccentrically mounting said control valve for movement from a closed position and toward an open position by air flow through said secondary conduit, and spring biasing means for said control valve connected to said secondary throttle and responsive to the position of the secondary throttle whereby said control valve is urged into a closed position when said secondary throttle is in a closed position and the degree of bias exerted on said control valve is altered as said secondary throttle is opened.

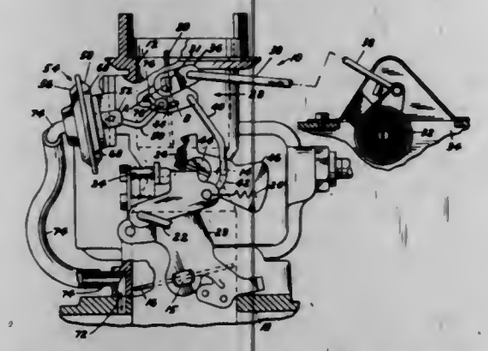
3,272,483
CARBURETOR
Charles L. Martin, St. Louis, Mo., assignor to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey
Filed June 10, 1965, Ser. No. 462,981
5 Claims. (Cl. 261—23)

1. A multistage carburetor for an internal combustion engine comprising
(1) a body structure having at least one primary mixture conduit and at least one secondary mixture conduit for the flow of air and fuel mixture therethrough;
(2) idle and main fuel systems including a main fuel nozzle for said primary conduit;
(3) a main fuel system including a main fuel nozzle for said secondary conduit;
(4) manually operated primary and secondary throttles movably mounted on primary and secondary throttle shafts in the respective mixture conduits downstream of said main fuel nozzles for controlling the flow of air-fuel mixture therethrough;
(5) means for sequentially opening said primary and secondary throttles including
(a) a foot pedal actuated lever arm pivotally mounted on the said secondary throttle shaft;
(b) a secondary throttle lever fixed to said secondary throttle shaft;
(c) a primary throttle lever fixed to said primary throttle shaft;
(d) pusher means constituting a connecting rod operatively connected by way of a split lever to said foot actuated lever arm and to said primary lever for urging the latter in a direction to open the said primary throttle, said pusher means and split lever having means to allow the said secondary throttle to continue moving in a direction to open the same after the said primary throttle is fully open.



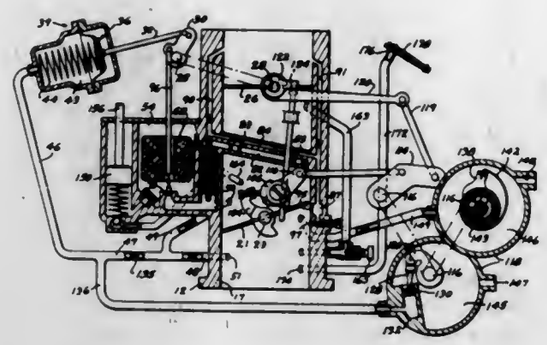
3,272,484
HONEYCOMB FILL FOR COOLING TOWER
Bruce B. Brand, Prairie Village, Kans., and Jerald J. Scott, Kansas City, Mo., assignors to Havens Structural Steel Co., Kansas City, Mo., a corporation of Missouri
Filed Aug. 22, 1963, Ser. No. 303,868
3 Claims. (Cl. 261—24)

1. In a cross flow cooling tower, the combination of a hollow, main tower body, a source of liquid at the top of said body, means for drawing air in a substantially horizontal path through said body, and a fill structure within said body, said fill structure comprising a plurality of abutted corrugated sheets located below said source of liquid, said corrugations forming substantially horizontal, open-ended, parallel passageways arranged with their axes in the direction of air flow, said passageways having lateral openings therein at intervals throughout the fill structure and providing communication between vertically adjacent passageways whereby to provide for dispersed gravity flow of liquid.



3. In a cross flow cooling tower, the combination of a hollow main tower body, a source of liquid at the top of said body, means for drawing air in a substantially horizontal path through said body, and a fill structure within said body, said fill structure comprising a honeycomb member located below said source of liquid, including a plurality of parallel, separated, flat sheets, and corrugated elements sandwiched between the flat sheets and defining with the flat sheets substantially horizontal open-ended parallel cells arranged with their axes in the direction of the air flow, said cells apertured at intervals along the conjunction between the corrugations and flat sheets and throughout the honeycomb structure, whereby to provide for dispersed gravity flow of liquid.

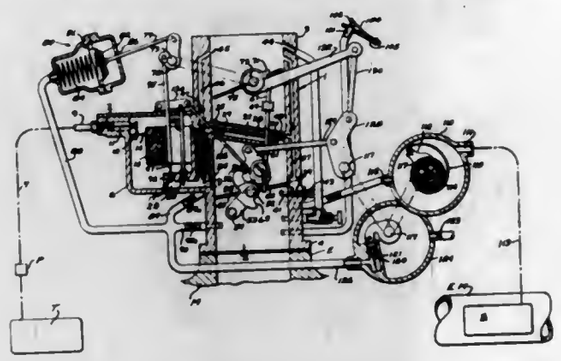
3,272,485
CARBURETOR
Ottis E. Newman, Normandy, Mo., assignor to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey
Filed Sept. 21, 1964, Ser. No. 397,724
4 Claims. (Cl. 261—35)



2. A carburetor comprising a body, a fuel and air mixture conduit through the body, a fuel inlet passageway formed in the body, said body formed with a pulsation pump, means for pulsing said pump, said pump being connected to a source of fuel and adapted to deliver fuel under pressure to the fuel inlet passageway, said body formed with a fuel chamber in communication with the fuel inlet passageway, an inlet valve in said fuel inlet passageway for controlling the flow of fuel into the said fuel chamber, means for operating said inlet valve, said body having a fuel connection between the fuel chamber and said mixture conduit, said fuel connection including an enlarged recess opening into said mixture conduit, a mass of fuel absorbent sponge material filling the inner extremity of said recess, said sponge material being of polyurethane foam and having about 60–80 connected pores per inch whereby to permit substantially free flow of fuel therethrough, said sponge material causing partial breaking up of said fuel as the fuel is ejected into the mixture conduit from the nozzle.

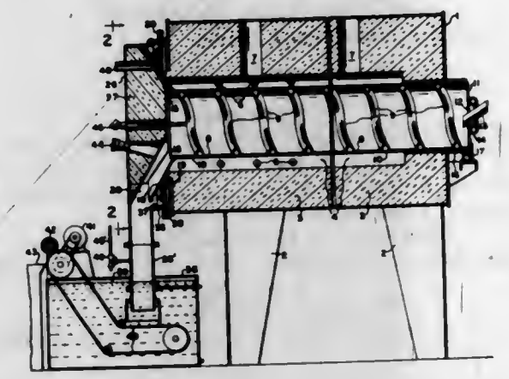
3,272,486
CARBURETOR HAVING AN AUTOMATIC CHOKE
Alvin S. Lucas, Farmington, and Charles W. Saussele, Southfield, Mich., assignors to Holley Carburetor Company, Warren, Mich., a corporation of Michigan
Filed Mar. 26, 1963, Ser. No. 268,008
7 Claims. (Cl. 261—39)

1. In an internal combustion engine carburetor having an automatic choke including a choke plate unbalanced to open in response to airflow, thermostatic means adapted to resist opening of the choke plate when the engine is cold and vacuum responsive means for opening said choke plate a predetermined amount against the closing force of the thermostatic means upon starting of the engine, and independent means including slot means for holding said choke plate closed until the engine starts, and link means connecting said vacuum responsive means to said slot means such that said link means becomes disengaged from said slot means when said vacuum responsive means is fully actuated.



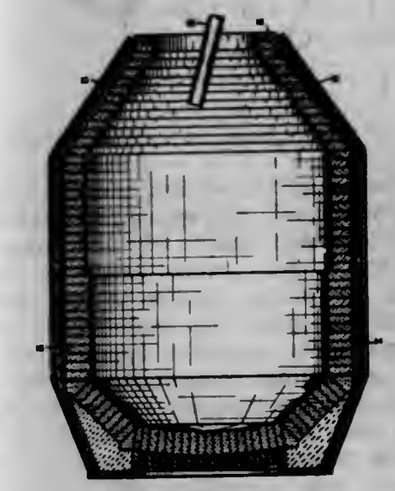
3,272,487
CARBURETOR
Forrest W. Cook, Webster Groves, Mo., James T. Bickhaus, Granite City, Ill., and Robert J. Smith, Florissant, Mo., assignors to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey
Filed Apr. 29, 1963, Ser. No. 276,472
14 Claims. (Cl. 261—39)

1. A carburetor for an internal combustion engine, said carburetor comprising a body structure having an air and fuel mixture conduit therethrough, a throttle valve mounted across said mixture conduit for movement from an open to a position closing said mixture conduit, means for operating said throttle valve, an air valve mounted within said mixture conduit anteriorly of said throttle valve for movement from an open to a position closing said mixture conduit, said body structure having a fuel chamber therein and a fuel passage extending from said fuel chamber to said mixture conduit for supplying fuel thereto, said passage having a metering restriction, a metering rod operatively connected to said air valve, said metering rod having a portion of varying thickness within said metering restriction to vary fuel flow through said fuel passage, a servo motor responsive to ambient air pressure connected to said air valve to control said air valve, means forming a first air passage to said servo motor from said mixture conduit downstream of said air valve to expose said servo motor to changes in air pressure in said mixture conduit in response to operation of said throttle, means forming a second air passage from ambient air to said first air passage, and temperature responsive valve means in said second air passage for controlling the flow of air through said second passage whereby to modify the operation of said servo motor in response to engine temperatures.



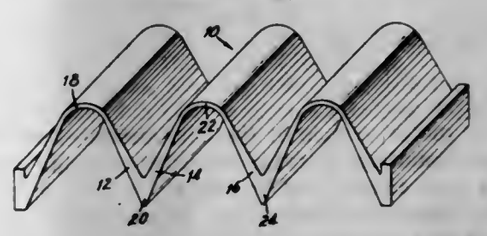
3,272,488
CARBURETOR
James T. Bickhaus, Granite City, Ill., assignor to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey
Filed Dec. 23, 1963, Ser. No. 332,466
4 Claims. (Cl. 261—39)

1. A carburetor comprising a body structure having an air and fuel mixture conduit therethrough, a throttle valve mounted across said mixture, conduit for movement from an open to a position closing said mixture conduit, a throttle lever connected to said throttle valve and movable therewith for operating said throttle valve, an air valve mounted within said mixture conduit anteriorly of said throttle valve for movement in response to air flow through said mixture conduit from a position closing said mixture conduit to an open position, a spring connected between said air valve and said carburetor body and biasing said air valve toward a closed position, said carburetor body including a fuel reservoir and first and second fuel passages connected between said fuel reservoir and said mixture conduit, a first metering rod movably mounted on said carburetor and having portions varying sequentially from a first small thcikness to a larger thickness to a second small thickness positioned for movement into said first fuel passage for varying the flow of fuel therethrough, linkage means connecting said metering rod operatively to said air valve to be moved therewith upon the opening and closing movement of said air valve, a second metering rod movably mounted on said carburetor body and having a portion of varying size including a conical shoulder extending into said second fuel passage, a conical surface in said second



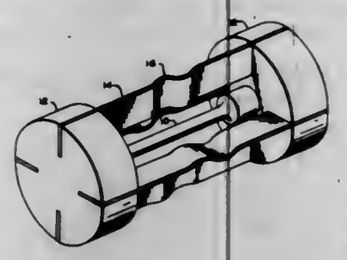
fuel passage, a temperature sensitive spring connected to said second rod for biasing said second metering rod portion into said second fuel passage at temperatures above a predetermined value to reduce fuel flow to said mixture conduit, said temperature sensitive coil being responsive to temperature below said predetermined value to move said second metering rod portion progressively out of said second fuel passage to increase fuel flow in response to drops in temperature.

3,272,489
HEAT TREATING FURNACE WITH REMOVABLE HELICAL INSERT
Walter E. Heyer, Los Alamitos, and Harold E. Mescher, Pico Rivera, Calif., assignors to Pacific Scientific Company, San Francisco, Calif., a corporation of California
Filed Mar. 13, 1964, Ser. No. 351,643
6 Claims. (Cl. 266—4)



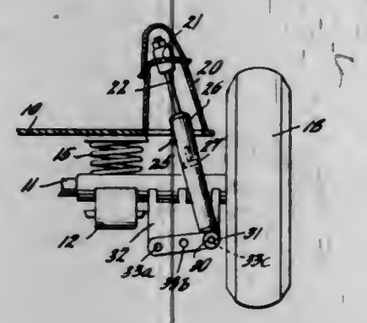
1. A heat treating furnace comprising a furnace casing having a heating chamber therewithin, means for heating said chamber, and a substantially cylindrical retort extending within said heating chamber for rotation therein, said retort having a relatively thin inner lining provided with a hollow smooth rounded helix extending the length thereof, said retort having an outer support casing for supporting said inner lining in use, said inner lining being of slightly lesser diameter than its support casing whereby the former can be slipped into the latter for use and secured therein, said inner lining being readily removable from its support casing for replacement of said lining when worn.

3,272,490
STEELMAKING FURNACE
Robert P. Ross, Louisville, Ky., assignor to Corhart Refractories Company, Louisville, Ky., a corporation of Delaware
Filed Sept. 25, 1963, Ser. No. 311,439
3 Claims. (Cl. 266—35)



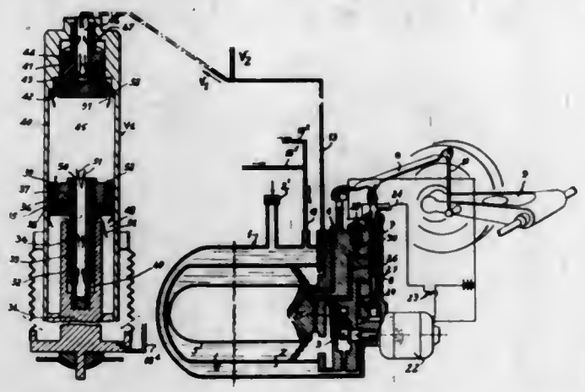
1. In a basic oxygen furnace comprising a generally pear-shaped tank, refractory lining covering the internal surfaces of said tank and means for providing an oxygen blast directed into said refractory lined tank, the improvement comprising a chrome-magnesia fused cast refractory material forming at least part of said refractory lining and having a composition consisting of, analytically by weight, 40% to 79% MgO, up to 20% FeO, 4% to 58% Cr_2O_3, up to 35% Al_2O_3, up to 10% TiO_2, up to 5% SiO_2, up to 3% CaO and up to 5% fluorine.

3,272,491
RESILIENT SPRING
Richard R. Knittel, Martinsville, N.J., assignor to Union Carbide Corporation, a corporation of New York
Filed Mar. 3, 1964, Ser. No. 349,086
5 Claims. (Cl. 267—1)



1. A spring comprising an undulating member having resilient leg sections and resilient juncture sections between adjacent leg sections, the junctures having alternating rounded, arcuate configurations and sharp configurations, said rounded configurations having the arc extending over a substantial portion of the convolution, the cross sectional area of the member at the sharp configuration being substantially greater than the cross-sectional area of the member at the rounded juncture, said leg sections being substantially straight and inclined and the cross-sectional area of the leg sections decreasing uniformly over their length from thick, sharp juncture, to the thin rounded juncture.

3,272,492
TRANSVERSELY SUPPORTED TORSION BAR
William A. Jones, Boston, Mass., assignor to Northrop Corporation, Beverly Hills, Calif., a corporation of California
Filed Mar. 11, 1964, Ser. No. 350,953
3 Claims. (Cl. 267—1)

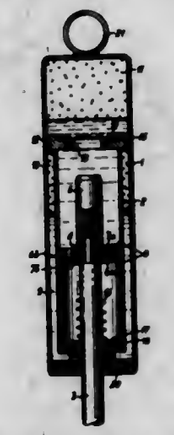


1. A torsional spring assembly, comprising a torsion bar having a relatively high spring rate in torsion and being relatively flexible transversely of a longitudinal axis thereof, a pair of hubs secured axially on opposite ends of said bar for rotation relative to one another, and a plurality of leaf springs circumferentially-spaced about said bar and rigidly secured at opposite ends thereof in said hubs, said springs being relatively stiff transversely of said axis, having a relatively low spring rate in torsion about said axis, and comprising transversely-corrugated strips having relatively low resistance to axial stretching and therefore being compliant with relative rotation of said hubs to torque said torsion bar about said axis.

3,272,493
SHOCK ABSORBERS
Christian Marie Lucien Louis Bourcier de Carbon, 64 Blvd. Maurice-Barres, Neuilly-sur-Seine, France
Filed Aug. 26, 1964, Ser. No. 392,205
3 Claims. (Cl. 267—8)

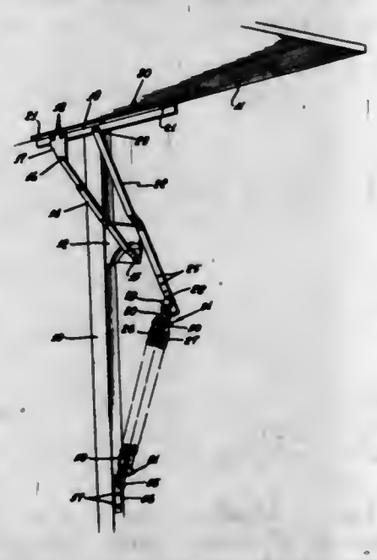
1. In a motor vehicle of the class described, a chassis, a wheel mounting, a main suspension spring disposed between said chassis and the wheel mounting, a shock absorber disposed between the chassis and the wheel mounting and in general parallelism relative to said supporting spring, said shock absorber including a cylinder and a piston therein and the piston rod fixed to said piston and extending from one end of the cylinder, attaching means at opposite ends of said shock absorber, means pivotally connecting an upper end of said shock absorber to said chassis, and means connecting the lower end of said shock absorber with said wheel mounting, said last-named means comprising a plurality of selective connecting points of attachment aligned in a direction transverse to the direction of travel of the vehicle, whereby there is a choice of different angular positions of installation of said shock absorber in relation to the direction of vibratory movement between said chassis and said wheel mounting, in order to vary the hardness of the ride.

3,272,494
SUSPENSION FOR VEHICLES
René Lucien, Neuilly-sur-Seine, and Emile Tetart, Louvie-Juzon, France, assignors to Societe à Responsabilite Limitee Recherches Etudes Production R.E.P., Paris, France
Original application Mar. 2, 1964, Ser. No. 348,338, now Patent No. 3,208,760, dated Sept. 28, 1965. Divided and this application Aug. 11, 1965, Ser. No. 510,997
3 Claims. (Cl. 267—64)



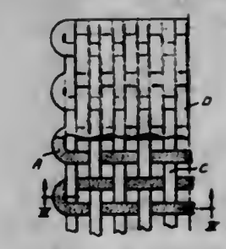
1. In a suspension for vehicles with an oleo-pneumatic accumulator, a shock-absorber jack comprising a cylinder, a piston adapted to move in said cylinder, a piston rod comprising near its upper extremity, two distinct coaxial portions separated by an annular damping space, one of said portions comprising a piston separating two chambers of said cylinder, one upper chamber, the other lower chamber, communicating with each other on the one hand through orifices formed in the separating piston, controlled by a clapper valve and permitting free passage of the liquid when said valve is open, and on the other hand, through the intermediary of said annular damping space and of orifices in the lower portion of the piston rod, said clapper valve being open during the compression stroke and closed during the expansion stroke, at the upper portion of said cylinder and in said cylinder, a member interposed between said upper chamber and the connection to the oleo-pneumatic accumulator, a second annular damping space comprised between said interposed member and the body of the cylinder, channels formed in said member and permitting free passage of the liquid between said connection and said upper chamber, and a second clapper valve for controlling said channels, said valve being open during the expansion stroke and closed during a compression stroke.

3,272,495
HYDROPNEUMATIC SUSPENSION UNIT
Ludwig Axthammer, Schweinfurt (Main), Germany, assignor to Fichtel & Sachs A.G., Schweinfurt (Main), Germany, a corporation of Germany
Filed Aug. 17, 1964, Ser. No. 390,063
Claims priority, application Germany, Aug. 20, 1963, F 40,532
19 Claims. (Cl. 267—64)



1. In a hydropneumatic suspension unit, in combination:
(a) a cylinder member having an axis and defining a cylinder space therein;
(b) a piston member axially reciprocable in said space between two terminal positions, said piston member axially dividing said cylinder space into two compartments;
(c) a liquid substantially filling said compartments;
(d) air cushion means in pressure transmitting engagement with said liquid;
(e) a storage chamber;
(f) a supply of said liquid in said chamber;

(g) pressure means for maintaining the liquid in said storage chamber under pressure;
(h) resilient valve means interposed between said storage chamber and one compartment of said cylinder space for normally separating the liquid in said storage chamber from the liquid in said cylinder space under the resilient force of said valve means, said valve means including
(1) a valve seat member formed with a conduit having respective orifices in said storage chamber and in said one compartment, said valve

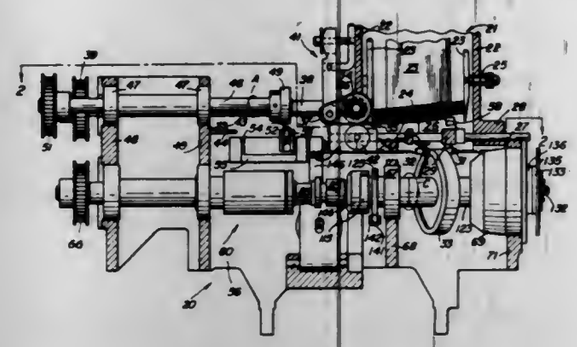


seat member having an annular face in a plane about the orifice of said conduit in said one compartment, and
(2) a valve disk member in said one compartment, said valve disk member having a face portion normally sealingly engaging said annular face; and
(i) yieldably resilient abutment means on said piston member engageable with said valve disk member for moving said face portion thereof away from said plane when said piston member approaches one of the terminal positions thereof.

3,272,496
SPRING CONNECTION
Paul M. Halopoff and William Halopoff, Los Angeles, Calif., assignors to Hally Stamping and Manufacturing Company, Los Angeles, Calif., a corporation of California
Filed Mar. 3, 1964, Ser. No. 349,108
6 Claims. (Cl. 267—74)

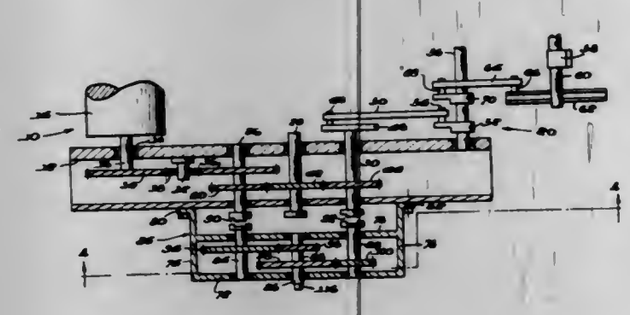
1. A spring connecting device for a pair of elongated coiled tension springs comprising a fitting for an end of each spring, each said fitting comprising a plate with a butt at one end having a plurality of coil receiving recesses on opposite edges in spiral spacing and adapted to receive and hold a plurality of endmost coils of spring wire, each said plate having a mounting hole therein, a spring fastener fitting at each end of the pair of springs, mounting means for mounting said springs in pairs and at both ends to a respective one of said fittings comprising a pair of hook elements attached to the respective fitting, one of said plates being mounted on each hook element, and a separate removable connection extending from one plate to the other and in a position attaching said plates together whereby the springs are anchored to the mounting means and to each other to prevent dislodgement should a spring break under tension.

3,272,497
SUPPORTING STRAP FOR FURNITURE UNIT
Philippe Valdelievre, 95 Rue de l'Industrie, Wervicq-Sud, Nord, France
Filed May 7, 1965, Ser. No. 467,800
4 Claims. (Cl. 267—110)



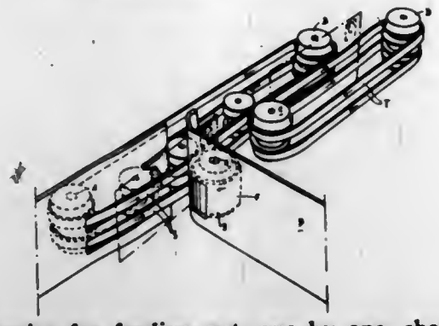
1. A one-way extensible webbing which consists essentially of:
a plurality of extensible cotton-covered rubber warp threads;
and a plurality of inextensible weft threads, interwoven with said extensible cotton-covered warp threads, consisting essentially of jute, said jute weft threads and said cotton-covered rubber warp threads being of similar overall thickness, the interweaving of said jute weft threads with said cotton-covered rubber warp threads frictionally inhibiting the elongation of said cotton-covered rubber warp threads whereby the extensibility of said cotton-covered rubber warp threads is retarded.

3,272,498
INTERMITTENT DRIVE FOR CARD FEED DEVICES OR THE LIKE
Erwin F. C. Schulze, Novelty, Ohio, assignor to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware
Filed June 12, 1964, Ser. No. 374,767
17 Claims. (Cl. 271—5)



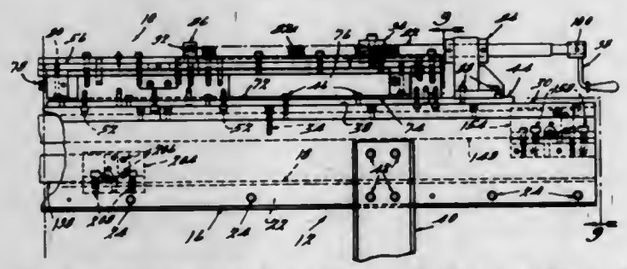
1. A cyclically operable card feed mechanism for feeding individual record cards, one-by-one, at high speeds, from a storage magazine comprising:
a movable feed member for engaging each successive card in the magazine to feed the card therefrom;
an operating shaft;
means coupling said feed member in mechanically driven relation to said operating shaft;
a drive shaft;
a control shaft;
clutch means for engaging said drive shaft in mechanical driving relation to said control shaft;
a torsion bar having one end connected to said control shaft and having its other end connected to said operating shaft;
holding means for maintaining said control shaft stationary in predetermined angular alignment with said

operating shaft and with said torsion bar stressed with a preselected torque;
and actuating means for engaging said clutch means and releasing said holding means in predetermined



timed relation to each other to permit said torsion bar to initiate rotation of said control shaft at the beginning of a card feed cycle to provide for engagement of said clutch means under minimum inertia conditions.

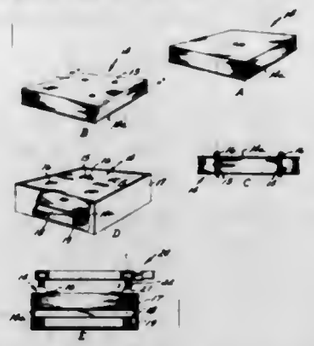
3,272,499
MECHANISM FOR FEEDING BOX BLANKS
Theodore M. Baum, Baltimore, Md., assignor to Koppers Company, Inc., a corporation of Delaware
Filed Oct. 12, 1964, Ser. No. 403,103
12 Claims. (Cl. 271—10)



1. Apparatus for feeding box blanks at three timed frequencies with adjacent processing machinery comprising,
a reciprocating feeder for feeding box blanks successively from a stack to adjacent processing machinery,
an output shaft connected to said reciprocating feeder and operable upon rotation to reciprocate said feeder,
an input shaft connected to and driven by said adjacent processing machinery in timed relation thereto,
a primary transmission operable to connect said input shaft to said output shaft for reciprocating said feeder at a first timed frequency relative to adjacent processing machinery,
an auxiliary transmission operable in a first position to connect said input shaft to said output shaft for reciprocating said feeder at a second timed frequency relative to said processing machinery and in a second position to connect said input shaft to said output shaft for reciprocating said feeder at a third timed frequency relative to said processing machinery, and
said primary and auxiliary transmissions constructed and arranged so that in all of said frequencies said reciprocating feeder feeds box blanks into the adjacent processing machinery at a linear velocity substantially equal to the peripheral velocity of a rotating member in said adjacent processing machinery.

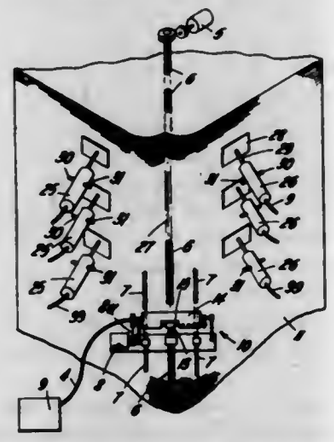
3,272,500
DEVICE FOR GUIDING POSTAL ARTICLES, FORMS OR THE LIKE
Christiaan Johannes van Dalen, Leidschendam, and Cornelis Leendert de Jong, The Hague, Netherlands, assignors to de Staat der Nederlanden, ten Deze Vertegenwoordigd door de Directeur-Generaal der Posterijen, Telegrafie en Telefonie, The Hague, Netherlands
Filed Jan. 23, 1961, Ser. No. 84,268
Claims priority, application Netherlands, Jan. 25, 1960, 247,689
8 Claims. (Cl. 271—34)

1. Device for feeding out, one by one, sheets (Z) of laminar material, which together form a stack, said device comprising a positively driven conveyor member and a moveable friction member (F or 3) cooperating under pressure with the conveyor member (S), the cooperating parts of which members move along closed tracks and between which members the sheets are fed out, the direction of movement of the friction member being dependent on the possible presence between the friction member and the conveyor member of at least two superimposed sheets of laminar material (see FIG. 4), while the friction between the friction member and one of the sheets as well as the friction between the conveyor member and one of the sheets is greater than the friction between two of the sheets, continuously operating driving means 1, 2 for the friction member, including driving members and a slip clutch 5 between the driving members and the friction member, continuously tending to drive the friction member via the slip clutch, with a force which is always sufficient to overcome the friction between two of the sheets of laminar material, in a direction opposite to the direction in which the friction member is influenced by the conveyor member.



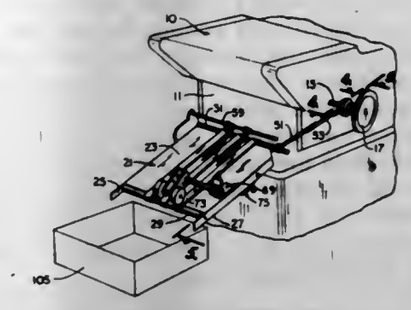
3,272,501
ADJUSTABLE STROKE INTERMITTENT SHEET FEEDER HAVING PLURAL SHUTTLE MEANS
Frederick P. Sharpe, Dearborn, Mich., assignor to Kelsey-Hayes Company, Romulus, Mich., a corporation of Delaware
Filed Feb. 17, 1964, Ser. No. 345,470
10 Claims. (Cl. 271—55)

6. In combination with a sheet metal shearing device, a work feeding apparatus which includes,
a support structure having an elongated work stock supporting surface,
means for laterally aligning sheet metal work stock on said surface including a plurality of rollers and means on said structure for moving said rollers laterally of said structure to and from engagement with the work stock,



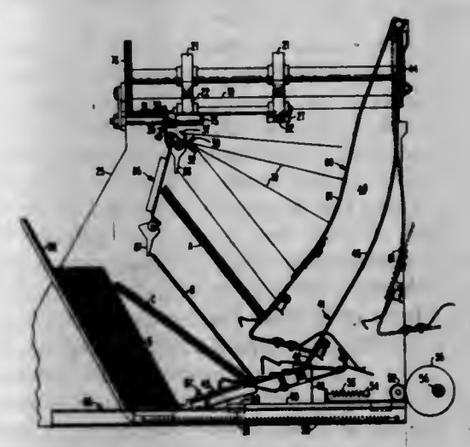
shuttle means longitudinally slidable in said support structure and successively engageable with said work stock to continually bias said work stock into said shearing device, and
means for effecting the longitudinal movement of said shuttle means.

3,272,502
APPARATUS FOR MANIPULATION OF THIN SHEET STOCK
Curtis M. Beachum, 5226 Park Lake Road, East Lansing, Mich.
Original application May 20, 1963, Ser. No. 281,427. Divided and this application Mar. 1, 1965, Ser. No. 440,057
2 Claims. (Cl. 271—62)



1. A flexible thin sheet stock dispenser comprising:
(a) a stack of thin sheet stock pierced to provide at least one transverse opening therethrough;
(b) a receptacle shaped to support upwardly and enclose from the sides, said stack of thin, pierced sheet stock;
(c) a spring loaded, false bottom providing in said receptacle upward support of said stack of thin sheets; and
(d) at least one elongate resilient member through each of said openings in said sheet stock, said resilient member constricted by said openings against radial expansion whereby friction on each of said sheets in said stack is established at the perimeter of each of said openings.

3,272,503
APPARATUS FOR SUCCESSIVELY OPERATING UPON SHEETS WHILST IN A STACK
Sidney Haines, Dovercourt, England, assignor to Vacumatic Limited, Essex, England, a British company
Filed July 15, 1964, Ser. No. 382,726
Claims priority, application Great Britain, July 16, 1963, 27,440/63
15 Claims. (Cl. 271—62)



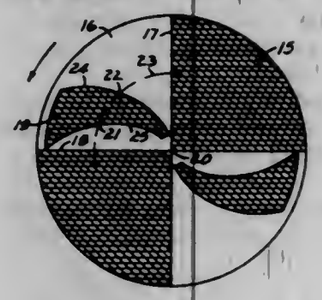
1. An apparatus for successively operating upon sheets whilst in a stack comprising a support for said stack, an operating head movable along and operating on the stack, means engageable with parts of the stack after a predetermined movement of the head along the stack, so as to move the sheets or parts thereof away from the head on one side thereby relieving the pressure of those sheets on the head during its operation.

3,272,504
DELIVERY DEVICE FOR A DUPLICATING MACHINE OR THE LIKE
Carl V. Schnoebelen, 408 E. Gray St., Des Moines, Iowa
Filed Mar. 23, 1964, Ser. No. 353,998
13 Claims. (Cl. 271—68)

1. In a delivery device for a duplicating machine having a delivery end and a drive shaft,
a first roller member operatively secured to the duplicating machine adjacent its delivery end,
a second roller member operatively secured to the duplicating machine outwardly of said first roller member and delivery end of the duplicating machine,
said first and second roller members being parallel,
a belt means extending between said first and second roller members,
means operatively connecting the drive shaft and one of said first and second roller members for rotating said first and second roller members and said belt means,
and a sheet gripping means on the duplicating machine between said first and second roller members.

3,272,505
CAPACITIVE GUIDING APPARATUS FOR RECORD ELEMENTS
Robert Arthur Sanderson, 14 Joyce Road, Wayland, Mass.
Filed Aug. 30, 1965, Ser. No. 494,290
4 Claims. (Cl. 271—71)

1. A unit record card processing machine comprising:
an electrically grounded frame;
feed means mounted on said frame for feeding unit record cards along a predetermined path within said frame; and



a guide member mounted on said frame and projecting into said predetermined path for preventing unit record cards carrying spurious electrostatic charges from adhering to said frame, said guide member comprising:

a first electrically conductive member mounted on said frame;

a second electrically conductive member projecting into said predetermined path so as to contact each unit record card, and receive a portion of the spurious electrostatic charge therefrom, and thereby electrostatically repel said unit record card; and

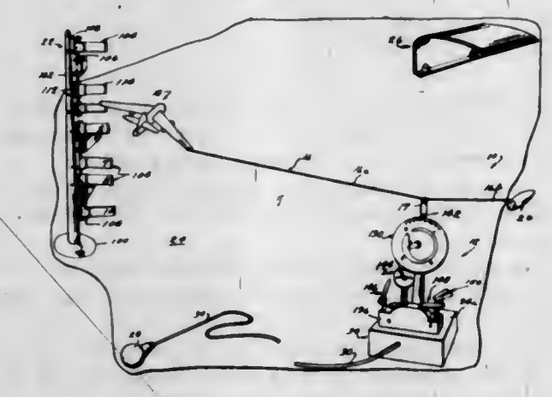
a dielectric member mounted on said first electrically conductive member and supporting said second electrically conductive member, said dielectric member having a shunt resistance which is sufficiently high to allow said second electrically conductive member to receive an electrostatic charge for repelling each unit record card, but sufficiently low that the electrostatic charge imparted to said second electrically conductive member by each unit record card is dissipated through leakage current before the arrival of the next unit record card.

3,272,506
PATTERN FOR GENERATING THE SUBJECTIVE EFFECT OF COLOR
George Wright Lescher, 303 Hillwood Drive, Nashville, Tenn.
Filed Nov. 22, 1963, Ser. No. 325,712
16 Claims. (Cl. 272—8)

1. A movable pattern comprising

(A) an illuminable and viewable pattern area, said pattern area having incorporated therewithin

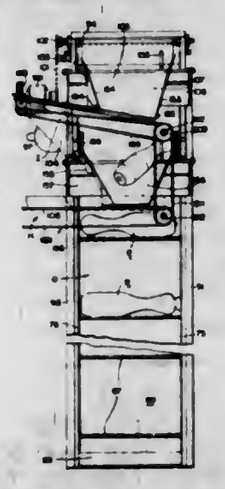
(B) at least one cycle unit so disposed as to be optically repeatable more than about 3 times per second in consequence of continuous motion of said pattern, said cycle unit comprising



(a) at least one essentially dark-shaded first segment extending transversely of the respective lines of motion of constituent points in said cycle unit, and extending longitudinally of said lines of motion in distance from about 30% to about 55% of the lineal dimensions of said cycle unit along the respective said lines of motion,

(b) at least one essentially light-shaded second segment extending transversely of said lines of motion, and extending longitudinally of said lines of motion for the remainder of the lineal dimensions of said cycle unit along the respective said lines of motion, said light-shaded second segment having a leading edge and a trailing edge, and said light-shaded second segment having disposed therewithin,

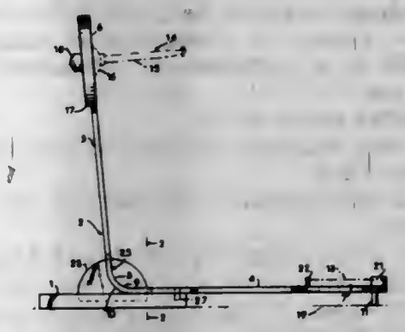
(c) at least one dark-shaded configurational element comprising a multiplicity of imaginary constituent lines essentially conjoined transversely of said lines of motion and extending longitudinally of said lines of motion a distance from about 15% to about 35% of the lineal dimensions of said cycle unit along the respective said lines of motion, said conjoined constituent lines terminating in conjoined ends thereof, said conjoined ends forming a leading edge and a trailing edge of said configurational element in a geometric disposition such that, in attitudes relative to said leading edge and said trailing edge of said light-shaded second segment,



(1) component portions of at least one of the two said leading edges and component portions of at least one of the two said trailing edges are in essence disposed obliquely to, at their respective intersections with, the said lines of motion of the constituent points at such respective intersections.

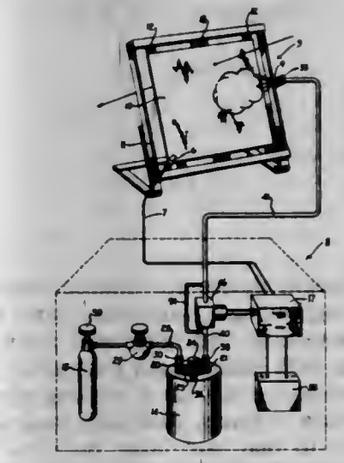
3,272,507
TETHERED AIRPLANE TOY
Manuel Grau, Guatemala City, Guatemala, assignor of one-half to Aniceto Vasquez Mendez, Mexico City, Mexico
Filed July 10, 1963, Ser. No. 294,207
11 Claims. (Cl. 272—31)

11. An amusement device comprising: a freely rotatable vertically disposed drive shaft fixed against lateral movement; a rod pivotally carried on fulcrum means pivoted intermediate its ends on said shaft for pivotal movement in a vertical plane; model means carried by one end of said rod at a location above the pivot point; balance weight means carried by the other end of said rod at a location above the fulcrum means, all of said means coacting to effect a single pivotal position of said rod at which said balance weight means and said model means balance each other both when said shaft is at rest and when said shaft is rotating, all of said means unbalancing said rod at all other pivotal positions when said shaft is at rest and tending to pivot said rod away from said single balance position when displaced from said position, whereby said model means when disposed below said position during rotation of said shaft swings up with an increase in rotational speed of said shaft and when disposed above said position during rotation of said shaft swings down with an increase in speed and whereby swinging movement of said rod through said position in either direction is effected only by acceleration or deceleration of the rotation of said shaft; a drive system for controllably accelerating and controllably decelerating said drive shaft by an operator, said drive system including a compressible pneumatic chamber remote from said drive shaft, an expansible chamber, a tube connecting said chambers whereby compression and release of said compressible chamber by the operator expands and contracts said expansible chamber, power transmitting means for converting expansion and contraction of said expansible chamber to torque on said drive shaft and for releasing said shaft for free rotation when said compressible chamber is released by the operator, and brake means responsive to full compression of said compressible chamber for decreasing the rotational speed of said shaft whereby alternate compression and release of said compressible chamber by the operator causes said shaft to rotate at a speed dependent on the rate of compression and release and whereby a prolonged and substantially complete compression of said compressible chamber applies braking force to said shaft to rapidly decrease the rotational speed of said shaft.



3,272,508
ELEVATOR DISCHARGE ORIENTING MEANS OPERATED IN RESPONSE TO ORIENTATION OF PINS ON THE ELEVATOR
Howard M. Dowd, Littleton, Royal L. Barrows, Middleton, and Oliver A. Landry, Revere, Mass.; W. Leroy Temple and State Street Bank and Trust Company, executors of said Howard M. Dowd, deceased, said Barrows and said Landry assignors, by mesne assignments, to Otis Elevator Company, New York, N.Y., a corporation of New York
Filed June 6, 1963, Ser. No. 286,015
5 Claims. (Cl. 273—43)

1. In an automatic bowling pinsetting machine having means including a bowling pin elevator for sequentially raising horizontally oriented bowling pins from a lower level to a higher level, means associated with said elevator for dislodging said pins therefrom at said higher level, and means including a slide for receiving said dislodged pins; means associated with said elevator for orienting bowling pins of the type having a relatively thick body and a relatively thin neck, and for insuring that such pins enter said slide with their base portion first which comprises a pair of pivoted arms each adapted to move between an upstanding position where said arm is adapted to engage the neck of a pin after said pin has been dislodged from said elevator, and before said pin has reached said slide, and a lowered position where said arm is out of the path of said pin, link means connecting said arms whereby when one of said arms is in the upstanding position the other of said arms is in the lowered position, and pin sensing means responsive to the passage of the pin on said elevator for detecting the neck portion of the pin and erecting the corresponding arm.



3,272,509
COMBINED ROLL-OVER TARGET AND AUTOMATIC RING-TOSSING AMUSEMENT DEVICE
William J. Rogers, 53—15 66th St., Maspeth 78, N.Y.
Filed Aug. 16, 1963, Ser. No. 302,500
8 Claims. (Cl. 273—102.1)

1. An amusement device comprising a toss-ring; an angular roll-over member having a first arm provided with a flat inner target face at its terminal end, a second arm provided with a flat inner face at its terminal end serving as a rest for the toss-ring, and an arcuate flat bottomed vertex portion joining the said two arms together, the roll-over member having a normal position in which it is in unstable equilibrium under gravity and in which position the first arm is upright and the second arm is prone; and a dart projectable against the target face having sufficient mass so as to unbalance the roll-over member upon impact and cause said member to

roll on its vertex portion and cause the first arm to drop rapidly to a prone position and sharply swing the second arm to an upright position, whereby the toss ring resting on the second arm is tossed toward the target face and the projecting shaft of a dart attached thereto, the dart having a suction cup attachable to the target face upon impact and having a shaft portion which extends perpendicularly to the target face upon attachment of the dart to the latter.

3,272,510
GENERATOR OF SIMULATED SMOKE SIGNALS FOR GUNNERY TARGET PRACTICE
John Alex Ingvar Ohlsson, Huskvarna, and Karl Ragnar Andersson, Jonkoping, Sweden, assignors to Saab Aktiebolag, a corporation of Sweden
Filed Nov. 19, 1962, Ser. No. 238—348
5 Claims. (Cl. 273—102.2)

1. Apparatus for providing to a gunner at a distance from a target a visual indication that he has scored a hit upon the target, in the form of a simulated smoke signal produced immediately after the target is hit, said apparatus comprising:

(A) a container adapted to hold a supply of finely powdered material in contact with gas under pressure and having

(1) a gas-tight closure,

(2) an outlet near its bottom and

(3) an inlet for gas under pressure;

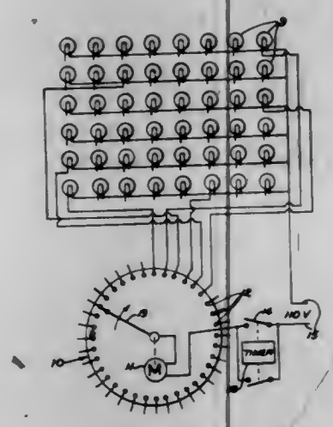
(B) means for connecting said inlet with a source of gas under substantially constant pressure;

(C) a solenoid valve having inlet and outlet ports;

(D) duct means connecting the outlet of the container with the inlet port of the solenoid valve so that the valve can control release from the container of powdered material entrained in gas under pressure;

(E) nozzle means located at the target and connected with the outlet of the solenoid valve, through which gas and entrained powdered material are expelled into the air when the valve is open, to produce the appearance of smoke;

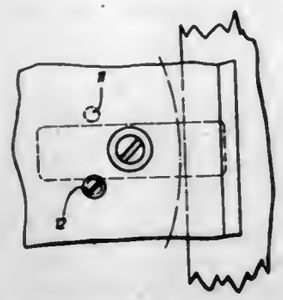
(F) transducer means at the target for producing an electrical impulse in consequence of passage of a projectile in a predetermined relationship to the target; and



(G) amplifier means having

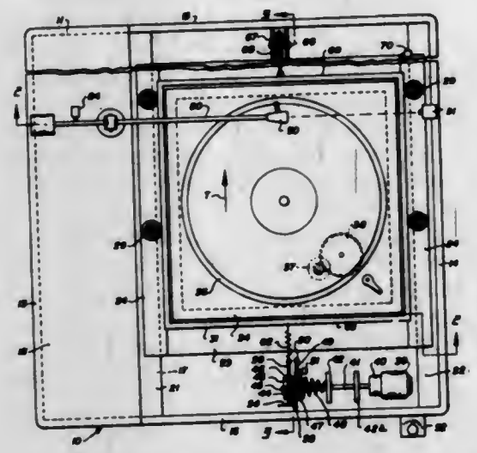
(1) input terminals connected with the transducer means and

(2) output terminals connected with the solenoid valve,



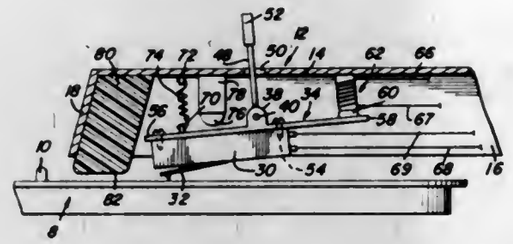
said amplifier means comprising time delay holding means for delivering a current of relatively long duration to said output terminals, to open the solenoid valve for a sufficient time to produce a distinctly visible simulated smoke puff in response to the brief electrical impulse delivered to said input terminals from the transducer means.

3,272,511
ELECTRICAL CHANCE DEVICE
Ennio Joseph Zarich, 747 Greenwich St., San Francisco, Calif.
Filed Feb. 18, 1964, Ser. No. 345,783
3 Claims. (Cl. 273—141)



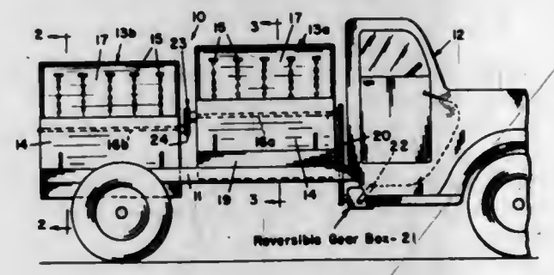
1. An amusement device for chance operation, comprising: a housing having a translucent panel on the front subdivided into vertical and horizontal rows of squares, an electric lamp bulb behind each said square, a stepping switch in said housing having a moving contact and a series of stationary contacts, each said stationary contact being connected to one said lamp bulb and serving to light that said lamp bulb each time said moving contact engages that said stationary contact, so that movement of said moving contact of said stepping switch results in said lamp bulbs blinking on and off cyclically, a unique number on each said square, said numbers being arranged in irregular random order, and a switch for energizing and de-energizing said stepping switch, the connection of the stepping switch contacts to the bulbs behind the squares being arranged in different irregular order from that of the arrangement of the squares, so that the appearance of random blinking of the bulbs is presented to an onlooker during operation of the stepping switch, thereby serving to attract and hold attention, one said bulb remaining lighted when the moving contact of the de-energized stepping switch has become stationary.

3,272,512
TRANSIT LATCH FOR PHONOGRAPH
Horst Zarm, Berlin-Zehlendorf, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Sept. 9, 1965, Ser. No. 486,111
Claims priority, application Germany, Sept. 10, 1964, P 35,038
3 Claims. (Cl. 274—1)



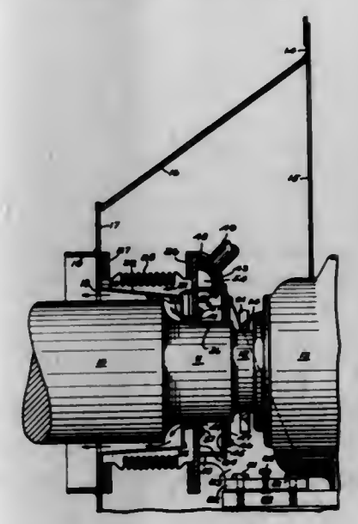
1. A transit latch for phonographs comprising the combination of a turntable mounting plate resiliently supported on a stand member; said latch comprising a locking lever, means movably suspending said lever below said mounting plate for moving said lever toward and away from said mounting plate, said locking lever having coextensive arms, one of said arms engaging said stand member when said lever is moved toward said mounting plate for locking said mounting plate against movement, and guide means on said mounting plate for normally straddling the other arm of said lever, said guide means being removable from said straddling position whereby said lever is angularly movable relative to said mounting plate for removal of said mounting plate from said stand member.

3,272,513
RECORD PLAYER
Joseph Jeles, 9910 Croft St., Chemainus, British Columbia, Canada
Filed Sept. 17, 1963, Ser. No. 309,546
16 Claims. (Cl. 274—13)



1. A record player for playing spirally grooved records comprising a rotatable record-carrying member, a stylus carrying pivotally mounted arm member normally extending substantially tangentially to the record-carrying member, one of said members being horizontally slidable relative to the other in a direction perpendicular to the arm member when the latter is in its normal position, an electric motor in an electric circuit operably connected to the slidable member to move the latter in said direction, a manually adjustable variable first resistor means in said circuit operable to govern the speed of the electric motor to synchronize the lateral shift of the slidable member to the shift of the arm member as a result of lateral movement of the stylus relative to the record and a second variable resistor means in said circuit and co-operating with the first resistor means, operably responsive to pivotal movements of the arm member as a result of variations in spacing of the spiral groove in the record to vary the total resistance in said circuit as the arm member tends to shift from its normal position to retain the latter in said normal position.

3,272,514
TONE ARM WITH RETRACTABLE CARTRIDGE AND STYLUS ASSEMBLY
Torjus B. Heyerdahl, 3311 Winsome Road, Boise, Idaho
Filed Sept. 13, 1965, Ser. No. 486,941
8 Claims. (Cl. 274—24)

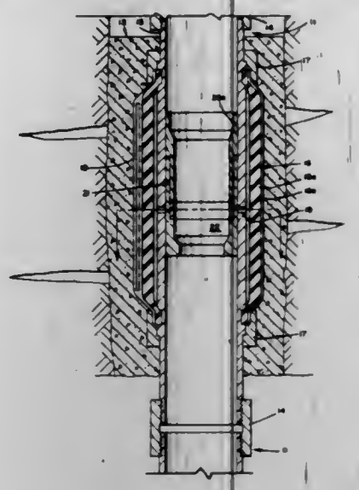


1. For use on a phonograph, an elongated tone arm embodying interconnected top, side and end walls defining a hollow open-bottom chamber, a suitable wired sound-pickup cartridge having a record groove tracking stylus, cartridge cradling mean pivotally mounted on a horizontal axis between the side walls and having end portions vertically tiltable relative to said top wall and open bottom, said cartridge being operatively mounted beneath but on the bottom of said cradling means and movable in conjunction therewith, spring means yieldingly joining one end of said cradling means to said tone arm, and shock responsive electric current controlled means constituting and providing openable and closable coupling means between said tone arm and the other end of said cradling means.

3,272,515
MILL MIXER AND SPREADER WITH TWIN COMPARTMENTS
George C. Wood, Darf Corp., Edenton, N.C.
Filed May 12, 1964, Ser. No. 366,855
5 Claims. (Cl. 275—3)

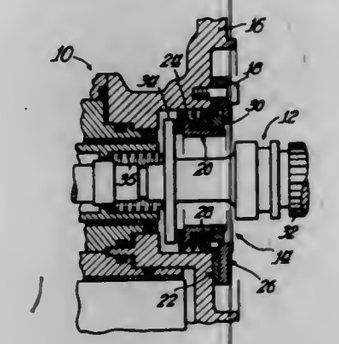
1. In a material mill, mixer and spreader, the combination of first and second milling, mixing and spreading units each including a material container having a discharge opening and first and second rotatable beater and unloader assemblies provided in the containers of the respective first and second units for discharging material through the container openings, drive means including an over-running clutch operatively connecting the second rotatable assembly to the first rotatable assembly whereby the second assembly may remain stationary when the first assembly is rotated in one direction but whereby the second assembly may be rotated when the first assembly is rotated in the relatively opposite direction, and power actuated means for rotating said first assembly selectively in opposite directions.

3,272,516
PRESSURIZED SEALS FOR THE SHAFTS OF FANS
Joseph H. Hoffman, Norwood, Mass., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 31, 1963, Ser. No. 334,772
8 Claims. (Cl. 277—4)



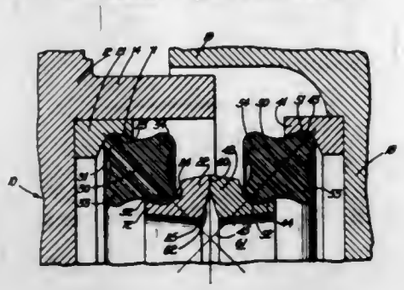
1. A pressurized seal for a shaft of a fan having a casing wall through which the shaft extends, comprising a pair of vertically extending, spaced apart plates spaced inwardly of said wall, an inwardly flared, open ended sleeve around and spaced from said shaft and attached to the innermost of said plates, said innermost plate having an opening around said shaft aligned with the opening in the inner end of said sleeve, a smaller, inwardly flared, open ended sleeve around and spaced from said shaft and attached to the outermost of said plates, and with its inner end adjacent to the outer end of said first mentioned sleeve, said inner end of said smaller sleeve having a smaller diameter than said outer end of said first mentioned sleeve, a seal ring around said shaft and attached to said outermost plate adjacent to the outer end of said smaller sleeve, a third, vertically extending plate spaced outwardly of said outermost plate and having an opening around said shaft, a second seal ring around said shaft and attached to said third plate, means including said third and outermost plates and said seal rings, forming an air chamber around said shaft, and means for supplying compressed air into said chamber.

3,272,517
CASING PACKER
George C. Howard and William G. Bearden, Tulsa, Okla., assignors to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed July 8, 1963, Ser. No. 293,459
3 Claims. (Cl. 277—26)



1. A well packer comprising an elongated tubular member adapted to be connected into a casing string to form a portion thereof; port means in the wall of said tubular member; a resilient, inflatable member attached to said tubular member and enclosing said port means; a valve member operatively connected to said port means to control the flow of fluid between the inside of said tubular member and said resilient member; and a non-elastic ther-

mal insulating member covering the outside of said resilient member and providing thermal insulation there-



for, said thermal insulating member being of greater resistance to heat transfer than said inflatable member.

3,272,518
PUMP SHAFT SEAL
Edward A. Prijatel, Lyndhurst, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Mar. 25, 1963, Ser. No. 267,730
2 Claims. (Cl. 277—30)

1. A fluid seal assembly for a rotary shaft having a radially extending flange thereon comprising: a seal ring assembly encircling the shaft, said seal ring assembly comprising a seal ring and a longitudinally extending seal ring holder; support means encircling the shaft and telescopically supporting said seal ring assembly; spring means positioned between said seal ring assembly and said support means to urge said seal ring assembly into engagement with the radially extending flange on the shaft; retainer ring means for retaining said support means; and axial misalignment compensating means comprising a wobble washer radially positioned between said retaining ring and seal ring assembly and O-ring seal means encircling said longitudinally extending portion of said seal ring assembly and positioned between said longitudinally extending portion and said support means to provide a seal therebetween on said wobble washer for cooperatively associating said wobble washer with said retainer ring means and said seal ring assembly, said means comprising a first pair of tangs on the outer periphery of said washer spaced substantially 180 degrees apart for association with said retainer ring means and a second pair of tangs on the inner periphery of said washer spaced approximately 90 degrees from said first pair of tangs for association with said seal ring assembly.

3,272,519
PIVOT SEAL CONSTRUCTION
Robert M. Voitik, Evanston, Ill., assignor to Continental Illinois National Bank and Trust Company of Chicago (trustee)
Filed Dec. 12, 1962, Ser. No. 244,032
9 Claims. (Cl. 277—92)

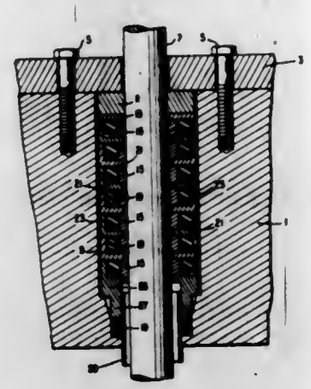
1. In a large diameter fluid seal, the combination comprising first and second pairs of inner and outer annular members adjoining one another, each of the members of a given pair axially and radially spaced from one another and having grooves formed therein, said grooves being so oriented as to be facing one another along a conical locus, first and second resilient sealing rings interposed between the respective pairs of annular members, each said sealing ring being of generally square cross section with rounded corners and scalloped sides to define lobes, each said sealing ring having diagonally opposite lobes, disposed on the conical locus of and in sealing engagement with the respective pair of annular members, the adjacent inner ones of the annular members being in bearing contact with one another for relative rotation, said grooves being of smoothly concave section thereby to permit bodily rocking movement of the engaged lobes of each sealing ring with respect to the grooves as the inner and outer annular members are moved axially toward one another into running position, and means for holding the outer ones of the annular members advanced inwardly toward one another so that the sealing rings are deformed into generally diamond-shaped cross section for the development of high sealing and bearing forces over the regions of engagement.

3,272,520
SHAFT SEAL ASSEMBLY
Brian K. Woolfenden, Lexington, Mass., assignor to Air Products and Chemicals, Inc., a corporation of Delaware
Continuation of application Ser. No. 200,515, June 6, 1962. This application Mar. 18, 1965, Ser. No. 444,915
13 Claims. (Cl. 277—165)

1. Apparatus for sealing a shaft which extends through an opening in a housing comprising

a seal assembly encompassing the shaft and extending axially of the shaft and being disposed at least in part within a cavity defined by an internal substantially cylindrical wall of the housing surrounding the shaft,

the seal assembly including a split sealing ring surrounding the shaft and located in a plane substantially perpendicular to the longitudinal axis of the shaft,



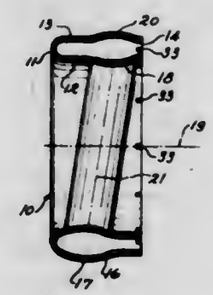
a pair of separate retainer rings surrounding the shaft and located in spaced planes substantially perpendicular to the longitudinal axis of the shaft,

the split ring being disposed between the pair of separate retainer rings in radially overlapping relation therewith and each retainer ring extending radially outwardly of the shaft beyond the outer surface of the split ring and terminating in an outer substantially cylindrical surface,

each retainer ring having an internal diameter greater than the external diameter of the shaft and the diameter of the outer cylindrical surface of each retainer ring being less than the diameter of the internal cylindrical wall of the housing,

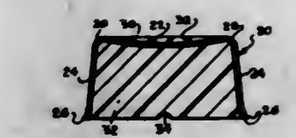
means for supporting the pair of retainer rings for relative movement,

an elastic deformable ring disposed between the pair of retainer rings and located radially outwardly of



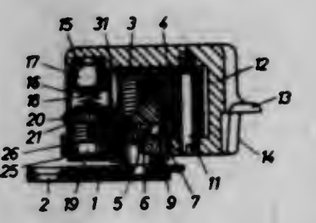
the split ring in contact with the outer surface of the split ring,

and spacer means disposed between the retainer rings radially outwardly of the elastic deformable ring,



the elastic deformable ring urging the split ring into contact with the shaft and providing a fluid seal with the split ring and a fluid seal with at least one of the retainer rings.

3,272,521
FLUID SEAL
Patrick J. S. McNenny, 11820 Edgewater Drive, Lakewood, Ohio
Continuation of application Ser. No. 164,816, Jan. 8, 1962. This application Mar. 4, 1965, Ser. No. 449,350
9 Claims. (Cl. 277—205)

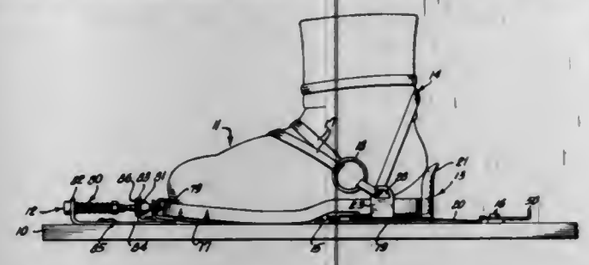


1. A seal comprising a ring formed of metal having axially extending spaced substantially parallel concentric legs having an imperforate surface and connected at one end by an imperforate end wall, annular projecting means integrally formed of said metal on each leg intermediate its ends and extending in a direction away from the other of said legs, each leg being formed of a base metal having a plurality of axially extending slots symmetrically formed in the portion of the base metal constituting the said projecting means and an imperforate layer of thin metal on each side of said base metal preventing leakage of fluid through said slots, said projecting means having a spring rate with respect to pressures producing changes in circumferential length of the extremities thereof which is substantially less than the spring rate of said base metal determined by its modulus of elasticity.

3,272,522
COMPOSITE METAL AND PLASTIC SKI
Michael E. Kennedy III, Seattle, Wash., assignor to Peter Kennedy, Incorporated, Seattle, Wash., a corporation of Washington
Filed June 21, 1965, Ser. No. 465,595
27 Claims. (Cl. 280—11.13)

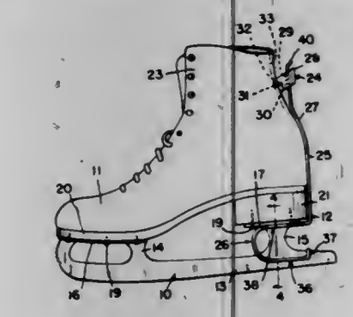
7. A ski, said ski comprising a skeleton frame and a body, said frame in a lateral cross-sectional view presenting the general configuration of a U with a base and downwardly directed legs, said base curving inwardly, and said downwardly directed legs being directed outwardly so that the lower ends of the legs form the running edges of the ski, and said body being bonded to said frame and encompassing part of said frame.

3,272,523
SAFETY FRONT JAW FOR SKI BINDINGS OR FASTENINGS
Hannes Marker, Alpspitzstrasse 37, Garmisch-Partenkirchen, Bavaria, Germany
Filed Jan. 31, 1964, Ser. No. 342,595
Claims priority, application Germany, Feb. 11, 1963, M 55,747
9 Claims. (Cl. 280—11.35)



1. A safety front jaw for ski bindings, comprising a baseplate secured to a ski, a pivot pin mounted on said baseplate at right angles to the surface of said ski, a pivoted member rotatably mounted on said pivot pin, a bore within said pivoted member which is preferably parallel to said pivot pin, a detent ball, a detent spring, and a spring abutment mounted within said bore, said spring abutment comprising a non-rotatably mounted, externally screw threaded bolt axially adjustable in the direction of the bore and mounted therein to adjust the spring compression, a knurled nut rotatably mounted on said bolt, said nut being axially non-displaceably mounted in a slot formed in said pivoted member extending at right angles to said bore, the outside peripheral surface of said nut protruding beyond the outside wall of said pivoted member, a detent recess in said baseplate, said detent ball engaging said detent recess.

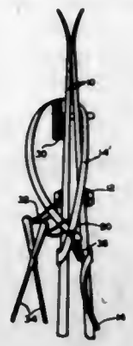
3,272,524
AUTOMATICALLY RELEASABLE LONG THONG SKI BINDING
Mitchell H. Cubberley, 121 Bell St., Belleville, N.J.
Filed Mar. 4, 1964, Ser. No. 349,243
10 Claims. (Cl. 280—11.35)



6. An automatically releasable long thong ski binding for securely but resiliently and releasably attaching the heel of a skier's boot to a ski which comprises in combina-

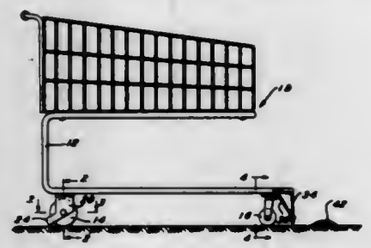
tion, a base plate, a leaf spring having one end connected to said base plate and a free end extending rearwardly therefrom, the free end of said leaf spring curving upwardly from said base plate when said spring is in relaxed

non-operative position but being adapted to be forced downwardly into an operative position whereby said leaf spring is tensioned, and long thong harness engaging means mounted on said ski binding.



3,272,525
ANKLE SUPPORT FOR SKATERS
August L. Nelson, 2916 Mesa Drive, West Covina, Calif.
Filed May 28, 1964, Ser. No. 370,859
4 Claims. (Cl. 280—11.36)

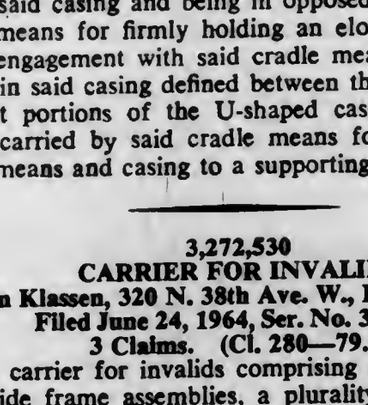
1. An attachment for a combined skate and shoe wherein the skate has a horizontally extending vertically disposed elongated blade provided at its upper edge with longitudinally spaced upright strut portions and has horizontal plates mounted on said strut portions and secured to the sole and heel respectively of said shoe; comprising a guide member attachable to the upper portion of said shoe at the rear thereof, and a single length of spring steel having a horizontally extending portion attachable to said skate between the elongated blade of said skate and the plate secured to the heel of said shoe, having an upright portion slidably engaging said guide member, and having an upstanding inverted U-shaped portion adapted to straddle the elongated blade of said skate.



3,272,526
SKI LOCKING MEANS
Merwin B. Rumaner, 310 Albert Road, Syracuse, N.Y.
Filed May 18, 1964, Ser. No. 368,042
5 Claims. (Cl. 280—11.37)

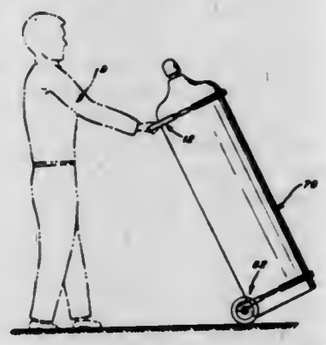
1. In a locking device for preventing the theft of a pair of skis: a flexible locking strap secured to one of the skis and comprising two strips of flexible material one overlying the other, means permanently securing said strips together to form the strap, a pair of grommet elements passing through said strips at spaced apart points on said strap, a flexible wire member disposed between said strips and fixedly secured at each end to one of said spaced grommet elements, the locking strap being adapted to be passed around the skis and a fixed object with a grommet element adjacent one end of the loop being brought into overlying relation to a grommet element adjacent the other end of the loop; and releasable means adapted to

pass through said pair of grommet elements to lock them together.



3,272,527
THEFT PROOF SHOPPING CART
Frank V. Martin, 214 Roosevelt Blvd., Brigantine, N.J.
Filed Jan. 13, 1964, Ser. No. 337,214
1 Claim. (Cl. 280—33.99)

Apparatus comprising a shopping cart having a pair of spaced ends, a pair of wheels at each end of said cart, at least one wheel housing depending from one of said ends, an axle mounting one of said wheels within said housing, a substantially U-shaped extension on said wheel housing for confining the movement of the cart within a predetermined area, said extension being separable from said housing and vertically adjustable in respect to said housing, a bracket secured to and depending from the other end of said cart, said bracket being spaced substantially equidistant between the wheels on other end of said cart, said bracket being substantially L-shaped in cross-section, said bracket having a first laterally projecting leg and a second downwardly projecting leg extending substantially perpendicularly from said first leg, a brace, means for connecting one end of said brace to said one end of said cart and the other end of said brace to said second leg of said L-shaped bracket, the lower most portion of said second leg of said bracket and said U-shaped extension being at an elevation lower than the highest portion of an abutment rail defining the limits of said predetermined area, whereby attempted movement of said cart outside of said area will be precluded by the contact of said second leg of said bracket and said U-shaped extension with said abutment rail.



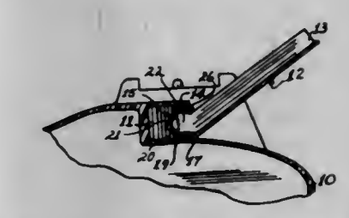
3,272,528
NESTABLE CART
Fred W. Young and Ralph G. Hummer, Oklahoma City, Okla., assignors to Unarco Industries, Inc., a corporation of Illinois
Filed Aug. 3, 1964, Ser. No. 387,016
6 Claims. (Cl. 280—33.99)

1. A nestable cart comprising an upright frame, a plurality of vertically spaced trays pivoted on the frame on horizontal axes, means interconnecting the trays for simultaneous pivotal movement, and means to tilt the trays from a horizontal position to a position at an acute angle to

horizontal in which they will interfit with trays on a similar cart.

3,272,529
SAFETY CLAMP HANDLE CONVERTIBLE TO A WHEEL ASSEMBLY
Isadore B. Rachman, Philadelphia, Pa., assignor to Metal Dynamics, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Filed Feb. 25, 1964, Ser. No. 347,242
8 Claims. (Cl. 280—47.13)

7. Means for holding and moving an elongated object or the like comprising a generally U-shaped casing, cradle means secured to said casing for seating an elongated object, flexible clamping means secured to one end of said casing and being in opposed relation to said cradle means for firmly holding an elongated object in seated engagement with said cradle means, at least one handle in said casing defined between the cradle and the adjacent portions of the U-shaped casing, and further means carried by said cradle means for attaching said cradle means and casing to a supporting surface.

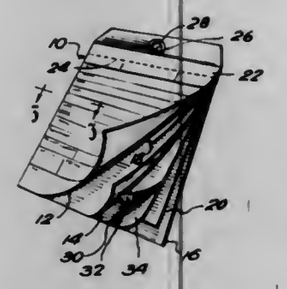


3,272,530
CARRIER FOR INVALIDS
John Klassen, 320 N. 38th Ave. W., Duluth, Minn.
Filed June 24, 1964, Ser. No. 377,721
3 Claims. (Cl. 280—79.2)

2. A carrier for invalids comprising a pair of spaced apart side frame assemblies, a plurality of cross members joining the side frame portions thereof, the side frames each comprising a front vertical member, a lower horizontal member, an intermediate horizontal member, a top hand rail member, means to join said lower, intermediate, and top members together so that the members comprising each side frame assembly all lie in a common plane, wheel means on said lower horizontal members for supporting said carrier for movement over a supporting surface, a removable seat positioned on and extending between said intermediate horizontal members of each side frame adjacent the rear portions thereof, a foot platform extending between said lower horizontal members, said foot platform being mounted for limited pivotal movement about an axis adjacent the forward edge thereof and resilient means urging said platform to a substantially

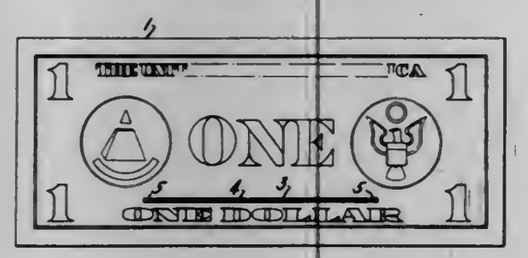
horizontal position, the rear portion of said platform being pivotable to position engaging the supporting surface against the action of said bias means.

3,272,531
TELEPHONE PAD HOLDER
Walter K. Krauth, Jr., 2631 Mayflower Road, College Park, Ga.
Filed July 27, 1964, Ser. No. 385,306
3 Claims. (Cl. 281—15)



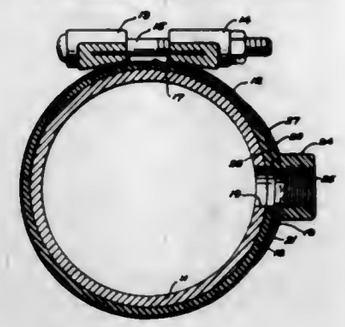
1. Apparatus for releasable attachment to a conventional telephone base, which base defines a carrying slot having a downwardly projecting lip therein including:
(a) an article to be attached to the telephone base;
(b) a holder for attaching said article to the telephone base, said holder comprising a single integral member having a generally plane support surface and an article receiving edge portion;
(1) said article receiving edge portion having a normal inner dimension approximately the same as the thickness of said article, and
(2) a normal outer dimension slightly greater than the vertical dimension of said slot at said lip,
(c) whereby when said holder and article are inserted in said recess, a pressure is created between the outer surface of said article receiving portion and the lip and inner surface of said slot and between the inner surfaces of said article receiving portion and said article.

3,272,532
MULTI-LEAF TAG
Robert W. Owen, Evergreen Park, Ill., assignor to Midwest Chemical Corporation, Chicago, Ill., a corporation of Illinois
Filed Dec. 1, 1964, Ser. No. 415,102
1 Claim. (Cl. 282—22)



A multi-leaf tag comprising:
a lower leaf;
an upper leaf superimposed relative to the lower leaf;
each of said leaves comprising means upon which information may be recorded;
means attaching a marginal portion of said upper leaf to a corresponding marginal portion of said lower leaf;

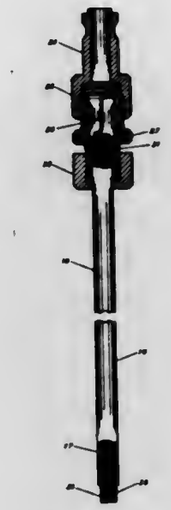
a transparent sheet located between the upper leaf and the lower leaf and superimposed relative to the lower leaf;
said transparent sheet comprising means for covering the lower leaf;
said transparent sheet having a sealing coating on the sheet surface adjacent the lower leaf;
detachable backing means covering said sealing coating on the transparent sheet;
means, located between said detachable backing means and said lower leaf and attached to a marginal portion of the lower leaf, for transferring, to the lower



leaf, information recorded on the upper leaf, during the recording operation;
and means, attaching a portion of the transparent sheet to a portion of the lower leaf, for maintaining the transparent sheet between the upper and lower leaves and for preventing said transparent sheet from being moved to a non-superimposed position, relative to the lower leaf, when the upper leaf is in a superimposed position relative to the lower leaf;
whereby said transparent sheet can be sealed to the lower of said leaves, only, upon removal of said detachable backing means, to protect said lower leaf.

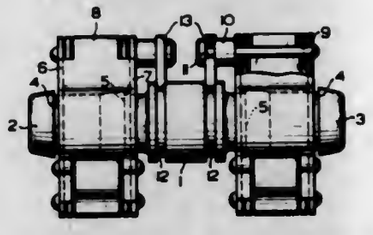
3,272,533
DETECTION TREATMENT OF PAPER MONEY AND OTHER NEGOTIABLE PAPER
Milton F. Allen, Decatur, Ga., assignor to Milton Frank Allen Publications, Inc., Decatur, Ga., a corporation of Georgia
Filed Oct. 5, 1964, Ser. No. 401,596
11 Claims. (Cl. 283—7)

1. The method of treating paper money and other negotiable paper for the purpose of imparting to unauthorized handlers and carriers thereof telltale residua of the treating material, which comprises applying to a surface of the said negotiable paper and confined within a frangible container affixed to such surface a treating material of a vaporizable character having a distinctive odor not readily noticeable in the open air or where circulation of air is relatively free but capable when confined in a relatively restricted space with a paucity of air of imparting such odor in readily distinguishable concentration to the negotiable paper and to adjacent articles such as a purse, pocketbook, bill fold, clothing pocket and the like on the person of the unauthorized handler and thus aid in his detection.



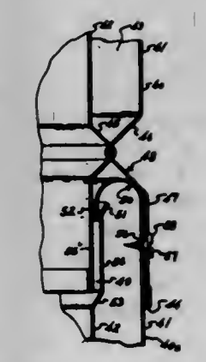
3,272,534
FLEXIBLE BAND COUPLING WITH TAPPED INSERT
Telford L. Smith, 1206 Lake St., Millbrae, Calif.
Filed May 21, 1965, Ser. No. 462,784
8 Claims. (Cl. 285—47)

1. A repair clamp for replacing a leaking or a pulled direct tapped outlet fitting in a fluid conduit, comprising in combination:
a flexible metal band extending around the pipe and having an opening aligned with the orifice in the pipe for the removed damaged fitting;
a gasket between the pipe and said band;
a pair of rigid lug members fixed to the ends of said band;
bolt means supported by said lug members for pulling the lugs together to tighten said band, said band having an outwardly projecting area surrounding said band opening;
a tapped insert member having a curved base portion seated within the recess formed by said projecting area in said band and an integral boss portion with a threaded bore extending through said band opening, the outer periphery of the base portion of the insert member being completely enclosed by the band said base portion having end portions tapered in cross section with spaced apart projections at said end portions forming an irregular shaped edge pattern, whereby when said band is tightened said fitting is secured tightly between said band and said gasket and the gasket material is allowed to flow between the end projections, thereby forming an effective seal around the fitting base portion said gasket having a circumferential length greater than the circumference length of said insert member.



3,272,535
SELF-STRAIGHTENING SUCTION WAND
George L. Neely, Berkeley, Calif., assignor to Chevron Research Company, a corporation of Delaware
Filed July 1, 1963, Ser. No. 292,012
1 Claim. (Cl. 285—114)

A suction wand for removing lubricating oil from the crankcase of an internal combustion engine through the dip stick tube, which comprises
(a) an elongated organic, polymeric plastic tube having a wall thickness thin enough to permit collapse thereof by air pressure upon the application of suction therethrough,
(b) said plastic tube having a uniform outer diameter adapted to pass downwardly through a dip stick tube into an engine crankcase,
(c) an elongated coil spring coextensive in length with said tube and having a uniform outer diameter substantially identical to the inner diameter of said plastic tube to permit frictional engagement between said tube and said spring throughout their lengths,
(d) said coil spring comprising a helical winding of spring wire sound sufficiently tight so that the individual turns are in preloaded contact with each other throughout the length of said coil spring, said preloaded contact being sufficient to provide self-alignment of said member and closing contact between said winding when not subjected to bending stresses, said coil spring and said plastic tube being secured together only at the end remote from the end adapted to enter the engine dip stick tube so that said coil spring will conform said plastic tube to the convolutions in said dip stick tube while still maintaining frictional engagement therebetween and

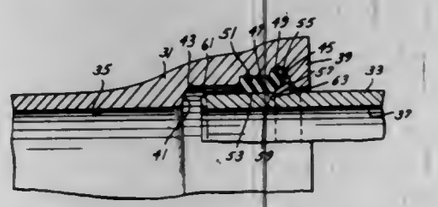


so that upon withdrawal of said plastic tube and coil spring, said coil spring will straighten said plastic tube to its substantially undeflected form by slight relief of the preloaded contact between said individual turns of said spring and by slippage between the inner diameter of said tube and said coil spring, and
(e) means for connecting said remote end of said tube and said coil spring to vacuum applying means for removing oil from an engine crankcase.

3,272,536
QUICK COUPLING DEVICE FOR HOSES
Karl Weinhold, 8 Kreitzweg, Holzheim, near Neuss, Germany
Filed Nov. 12, 1964, Ser. No. 410,405
9 Claims. (Cl. 285—114)

1. A coupling assembly for hoses, comprising,
a tubular section having a central portion of increased diameter and at least one tapered end portion adapted for insertion into the end of a flexible hose, said central portion having at least one circumferential groove provided therein,
at least one coupling device associated with one zone of said tubular section intermediate said central portion and said tapered end portion,
said coupling device comprising two sleeve halves each having two flanged end portions and pivotally connected with each other by means of a first pivot bolt, said sleeve halves when in closed position, surrounding said zone of said tubular section,
a toggle lever, pivotally connected to a first one of said sleeve halves by means of a second pivot bolt,
spring means connecting said toggle lever with the second one of said sleeve halves and adapted to urge said two sleeve halves into closed position upon swivelling said toggle lever into contact with the first sleeve half,
whereby said flange portions of said sleeve halves press a hose into which said free end of said tubular section has been inserted, against the outer wall of said tubular section,
positioning bolt means mounted on said coupling device on the side thereof facing away from the said tapered end portion of said tubular section and extending substantially parallel to the longitudinal axis of said tubular section,
said positioning bolt means having at least one circumferential groove provided therein of a cross sectional area substantially equal to that of said groove of said central tubular section portion, and
connecting means having a cross section adapted to be inserted into said grooves, said connecting means being removably inserted with its one end into a groove of said positioning bolt means and with its other end into said groove of the central portion of said tubular means, thereby securing said coupling device and said tubular section against displacement relative to each other in the direction of the longitudinal axis of said tubular section, while permitting radial displacement of said sleeve halves of said coupling device relative to said tubular section, said connecting means comprising a hoop-shaped fork member of spring steel, rectangular in cross section, the closed curved top end of which is of a curvature adapted to the diameter of said positioning bolt means in said circumferential groove therein, and the legs of said hook-shaped fork member being spaced from each other near the ends thereof by a distance corresponding to the diameter of said central portion of said tubular section in said circumferential groove thereof.

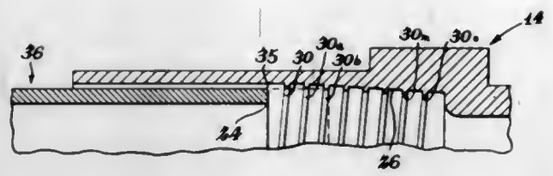
3,272,537
DOUBLE-WALLED VENT PIPE COUPLING
Richard L. Stone, Los Altos Hills, and Renato J. Bellatorre, Redwood City, Calif., assignors to Wallace-Murray Corporation, New York, N.Y., a corporation of Delaware
Filed Dec. 28, 1964, Ser. No. 422,486
5 Claims. (Cl. 285—187)



1. A pipe coupling for coupling double-walled flue pipe sections wherein the inner wall is of a material having a different coefficient of expansion than the outer wall, said coupling comprising a female element on one section and a male element on the other section fitted within the female element, said female element comprising radially

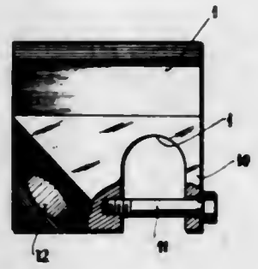
inwardly and outwardly extending bends in the outer and inner wall members forming apices, means securing the apices together to form an annular open ended trough with a V-shaped bottom, said male element comprising an arcuate return bend end portion on the outer wall in substantially line contact with the outer leg of the V-bottom of said trough, an outwardly expanded portion on the inner wall overlapping the inner end of the return bend of the outer wall radially outwardly of said end, and means securing the outer walls of the male and female members together, said contact between said arcuate return bend and said outer leg being so constructed and arranged to center the male element in the female element, said expanded element of the male element being so constructed and arranged to avoid buckling of the walls during thermal changes.

ERRATUM



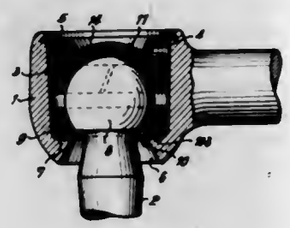
For Class 285—189 see:
Patent No. 3,272,542

3,272,538
RESTRAINED PIPE JOINTS
Myron F. Bergstrom, South Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York
Filed Nov. 17, 1964, Ser. No. 411,775
3 Claims. (Cl. 285—231)



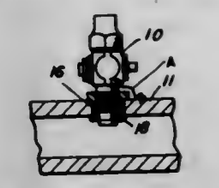
1. A connection for pipes comprising, in combination, a hollow cylindrical member provided with a radially intruding extremity defining a circumference larger than the outer circumference of a pipe section to be connected and having a radially and axially extending annular interior wall; a pipe section substantially coaxially disposed in said member; an annular groove formed in the inner wall of the hollow cylindrical member adjacent the end thereof, said groove being provided with an axially extending wall, a radially inwardly directed shoulder terminating the inner axial end of said groove and said radially and axially extending annular interior wall terminating the other end of said groove; said pipe section having a peripheral latch port formed on its outer surface adjacent its connection end; a resilient annular gasket arranged in and substantially filling said annular groove and sealably engaging said hollow cylindrical member and said pipe section, a portion of said gasket being compressibly confined between and exerting expansive force substantially radially on said pipe section and on said member; and latching means conjunctively arranged and peripherally disposed with said gasket and cooperatively engaging, under the expansive force of said gasket, said peripheral latch port on said pipe section and the radially and axially extending annular interior wall of said hollow cylindrical member along loading lines substantially normal to said radially and axially extending annular interior wall to lockably restrain axial separation of said member and said pipe section, said latching means having a thickness greater than the distance between the radially intruding extremity of the hollow cylindrical member and the outer peripheral surface of the pipe section.

3,272,539
CONDUIT FITTING
Ray W. Asbury, Sr., 222 Birch Place, Kewanee, Ill.
Filed Apr. 6, 1964, Ser. No. 357,694
5 Claims. (Cl. 285—332.4)



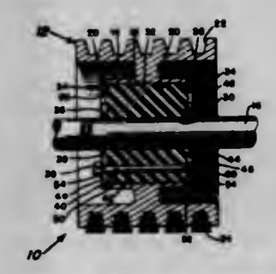
1. In combination, a conduit having an end, a generally continuous cylindrical surface having a constant diameter on said end, a fitting comprising a body having a generally central axis, a portion on said body tapered along said central axis, said tapered portion having a first diametral dimension greater than said cylindrical surface and a second diametral dimension less than said cylindrical surface, and spiral land means on said tapered portion drivingly cooperable with said cylindrical surface for securing together said fitting and said conduit upon relative rotation of said fitting and said conduit, said land means having a cross-sectional shape and size so as to be deformed by said cylindrical surface to cause said surface to engage said tapered portion completely around said cylindrical surface upon securement of said fitting and said conduit.

3,272,540
FASTENING ELEMENT FOR MEMBERS FORMING STRUCTURES OF SCAFFOLDS AND THE LIKE
Jacobo Glanzer, Av. Roque Saenz Pena 570, Buenos Aires, Argentina
Filed Sept. 24, 1963, Ser. No. 311,033
2 Claims. (Cl. 287—54)



1. A connecting piece, for use in interconnecting three elongated cylindrical elements at right angles to each other free from intersection, comprising a substantially cube shaped body containing three channels at right angles to each other and free from intersection with each other, each channel being located in a separate face of the cube and having a U-shaped cross section including a semi-circular arcuate bottom portion and two straight leg portions connected thereto, the section of said channel between said straight leg portions being unobstructed throughout the length of the channel by any part of said body, the radius of said semi-circular portion corresponding to that of a cylindrical element, each channel being adapted to engage removably an element, and being open throughout its length between said straight leg portions, one of said straight leg portions being relatively narrow and flexible, and an adjustable fastening means connected to and extending between said flexible leg and a part of the body opposite thereto which defines the other leg, said fastening means projecting across said unobstructed channel section and being adjustable so as to move said resilient leg toward the other leg thereby reducing the extent of the channel opening to clamp a cylindrical element in said channel, said cube shaped body also having a passage extending diagonally therethrough from one corner portion to another with the passage being free from intersection with any of the channels, and adapted to receive a cable therethrough.

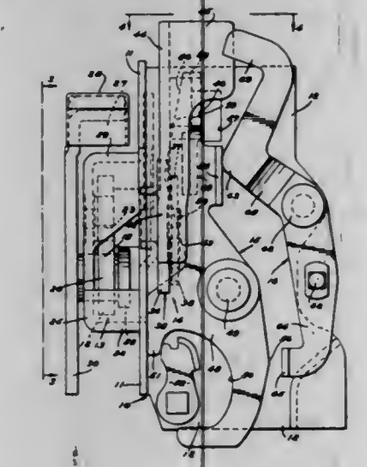
3,272,541
BALL JOINTS
Josef Latzen, Siegfriedstrasse 7, Dusseldorf, Oberkassel, Germany
Original application June 10, 1954, Ser. No. 435,890. Divided and this application Feb. 8, 1963, Ser. No. 264,467
1 Claim. (Cl. 287—90)



A self-adjusting ball and socket joint particularly adapted for the steering and control linkages of automobiles comprising a joint housing having openings at opposite ends thereof, a ball head movably received within said joint housing, a ball pin connected to said ball head and extending outwardly through one of said openings in said joint housing, a cover closing the remaining opening in said joint housing, the inner wall of said joint housing having a slight conical taper from the closure side of the housing towards the side at which the ball pin projects from the housing, said conical taper of the inside of said joint housing extending as far as a shoulder at the outlet opening of the housing, resilient mounting means positioned within said housing to resiliently secure said ball head both axially of the ball pin and also transversely thereof to permit self-adjusting movement of said ball head in all directions, said mounting means including elastic ring means having a substantially wedge-shaped cross section compressed between said ball head and the inside wall of said housing and disposed so as to exert positive pressure on said ball head over an annular area of said ball head substantially symmetrical with the longitudinal axis of said ball pin and with substantial pressure components both axial of and transverse to said ball pin axis, said elastic ring means including a ring element of potentially variable diameter resiliently surrounding the cover side of said head and an oppositely disposed slotted ring element provided on the side at which the ball pin projects from the housing, said ring elements being spaced on either side of a line extending transverse to said ball pin axis and passing through the center of said head, said slotted ring element on the side of the head at which the ball pin projects from the housing being disposed in spaced relationship with said shoulder of said housing to provide a lower wear gap, a plate disposed between said cover and said ball head and bearing on a surface of said ring means, said plate having a curvature corresponding to that of said ball head and being spaced therefrom to provide a wear gap, and helical spring means extending between said cover and said plate, said helical spring means operating to load said ring means.

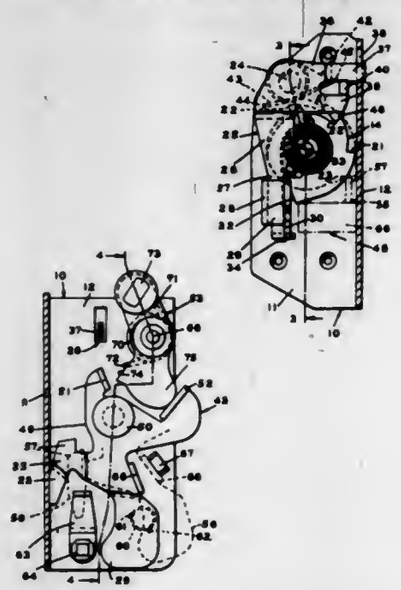
3,272,542
RESILIENT CONNECTING DEVICE
Leo J. Haulik, Leonard S. Greer, and Clarence W. Decker, Erie, Pa., assignors to Hays Manufacturing Company, Erie, Pa., a corporation of Pennsylvania
Filed Oct. 17, 1963, Ser. No. 316,988
5 Claims. (Cl. 285—189)

1. In combination, a pipe having a relatively thick wall and a sealing sleeve for sealingly supporting a branch member communicating with the inside of said pipe adapted to have a second member on the outer end thereof,
said pipe having an opening therein,
said branch member having a cylindrical portion disposed in said opening,
an end of said portion extending through said opening into said pipe,
said end of said portion being of constant diameter,
a groove in said end,
said sealing sleeve being made of flexible resilient material and disposed in said opening over said cylindrical end,
and a thickened portion homogenous with the remainder of said sleeve and made of homogenous material throughout on the inner end of said sleeve disposed in said groove in said end,
said sleeve in its undistorted form being thicker than the space between the outside of said cylindrical portion and the inside surface of said opening.



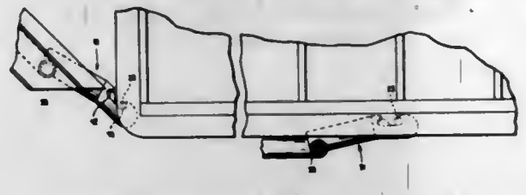
3,272,543
SHEAVE AND ROLLER ASSEMBLIES
William N. Poundstone, Morgantown, W. Va., assignor to Consolidation Coal Company, Pittsburgh, Pa., a corporation of Pennsylvania
Original application June 30, 1960, Ser. No. 39,985, now Patent No. 3,127,203, dated Mar. 31, 1964. Divided and this application Aug. 21, 1963, Ser. No. 303,552
4 Claims. (Cl. 287—52.07)

1. A flexible joint comprising in combination a rigid outer member having a bore therethrough, a rigid inner member having an outer cylindrical surface with a diameter less than the diameter of said outer member bore, a cylindrical bushing of flexible resilient material having a bore therethrough and an outer diameter substantially equal to the diameter of said outer member bore and an inner diameter greater than the diameter of said inner member outer cylindrical surface, said bushing having an end wall with a frusto-conical outer annular ring portion extending outwardly therefrom, said ring portion having an inner cylindrical wall substantially the same diameter as said bushing inner diameter and an outer sloping wall increasing in diameter toward said bushing end wall, a pair of rigid annular end plates having an outer diameter greater than the diameter of said outer member bore



and an aperture forming an inner wall with a diameter greater than the diameter of said rigid inner member outer cylindrical surface, said end plates having slotted portions therein, said bushing being positioned within said outer member bore, said inner member extending through said bushing bore, said end plates being positioned in abutting relation with the respective bushing end walls and with said rigid inner member extending through said respective plate apertures, one of said plate inner walls abutting said bushing ring portion outer sloping wall, and means to urge said end plates toward each other to thereby compress said resilient bushing therebetween to frictionally engage said outer member to said inner member and to extrude portions of said resilient bushing through said end plate slotted portions, said cylindrical bushing ring portion being adapted, upon compression by said end plates, to extrude outwardly between said inner member outer cylindrical surface and an end plate inner wall.

3,272,544
AUTOMOBILE DOOR LOCK
Arthur Moraczewski, Detroit, Mich., assignor to Ferro Manufacturing Corporation, a corporation of Michigan
Filed Jan. 14, 1964, Ser. No. 337,624
4 Claims. (Cl. 292—216)



1. In a door lock, a support, a detent having means mounting the same on said support for movement into and out of latching engagement with a latch unit movably mounted on said support, detent operating means to unlatch the lock including a detent operating member medially pivoted on said support, and means to lock the lock including a locking member medially pivoted on the support on an axis paralleling but laterally spaced from the medial axis of said detent operating member, said locking member having a locking element movable therewith into and out of position to prevent movement of said detent out of latching engagement with said latch unit, an unlocking control element movable therewith by which the locking member is actuated out of said position, and a locking control element movable therewith by which the locking member is actuated into said position; said locking, unlocking control and locking control elements being located on said locking member in spaced relation to one another in that order along the latter, said detent operating member having an operating element movable therewith to engage and move said detent out of latching engagement with said latch unit, an unlocking control element movable therewith and in position to actuate said first named unlocking control element, and a locking control element movable therewith and in position to actuate said first named locking control element; said operating, unlocking control and locking control elements of the detent operating member being located in spaced relation to one another along the latter, the unlocking and locking control elements of said detent operating member unidirectionally and respectively facing those of said locking member in an arrangement such that the unlocking control element of the detent operating member actuates the unlocking control element of the locking member prior to movement of said detent out of said latching engagement by said operating element of said detent operating member.

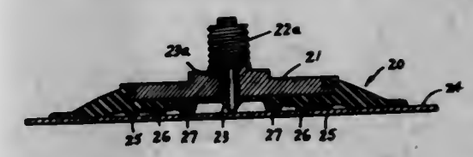
3,272,545
AUTOMOBILE DOOR LOCK
Joseph Pickles, Dearborn, Mich., assignor to Ferro Manufacturing Corporation, a corporation of Michigan
Filed Jan. 4, 1965, Ser. No. 423,036
7 Claims. (Cl. 292—216)

1. A door lock comprising a mounting bracket, a latching member and a detent device both pivotally mounted on said bracket, said latching member having at least one projecting abutment controlled by said detent device to releasably hold said member in a door latching position, and a further projecting kick-off abutment to function in the unlocking of said door lock, said detent device including a detent element engageable with said first-named abutment of said latching member to hold the latter in said door latching position, and an actuating member engageable and movable with said detent element to move the latter out of said holding engagement with the first named abutment in one direction of pivotal movement of the actuating member and detent element, said detent element also being movable relative to said actuating member in said direction in a further movement of the element out of said holding position, a locking device mounted on said bracket for movement into and out of a locking position, said locking device including a member movable upon movement of said locking device to locking position to a position of said member in which it renders said detent element incapable of being moved by said actuating member in said one direction out of said holding position, said locking device also including a kick-off part positioned when said locking device is in said locking condition in position in opposing relation to said kick-off abutment of said latching member, said kick-off part when in said opposing relation being engageable by said kick-off abutment to be shifted out of said last named position, said kick-off part and member of said locking device being operatively connected to one another whereby said last named shift of the part shifts said member of said locking device out of said position rendering said actuating member incapable of moving said detent element out of said holding position, said detent element being actuable by said latching member for said further movement when said latching member moves toward said latching position.

3,272,546
PUSH-PULL DEVICE FOR CONTAINERS
Charles R. Cooley, Louisville, Ky., assignor to Tri-City Industrial Service, Inc., Louisville, Ky., a corporation of Kentucky
Filed Dec. 3, 1964, Ser. No. 415,730
4 Claims. (Cl. 294—2)

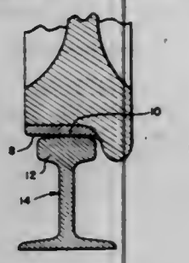
1. A push-pull attachment device adapted for cooperation with bars carried on a container spaced in the direction of intended motion of the container and extending transverse to the direction of container motion, said device comprising a tubular housing having a closed arcuate free end, said housing having a portion cut away adjacent said free end to provide two spaced and opposed bar-receiving throats which are spaced from each other along the longitudinal axis of said housing, said housing being adapted to underlie a container with said bar-receiving throats adjacent to the container bars, a rectilinearly movable pivotal mounting for said housing disposed below said bar-receiving throats and permitting pivotal movement of said housing and an axis transverse to its direction of rectilinear motion, resilient means biasing said housing about its pivotal axis to urge said throats into bar-receiving position, an abutment slidably mounted interiorly of said housing and movable between a first position blocking entry of a container bar into the one of said throats adjacent the closed end of said housing and a second position blocking entry of a container bar into the other throat, and a power element within said housing for moving said abutment between said positions, whereby as said housing is moved rectilinearly beneath a container the arcuate closed end of said housing engages the container bars pivoting said housing downwardly so as to initially clear said bars with said resilient means returning said housing to a position forcing the bars into one or the other of said throats depending upon whether said abutment is in its said first or second positions as said cut away portion of the housing registers with the bars.

3,272,547
DETACHABLE HANDLES
Vaughn K. Pryce, 417 4th St., Derry, Pa.
Filed Mar. 23, 1965, Ser. No. 442,108
4 Claims. (Cl. 294—31)



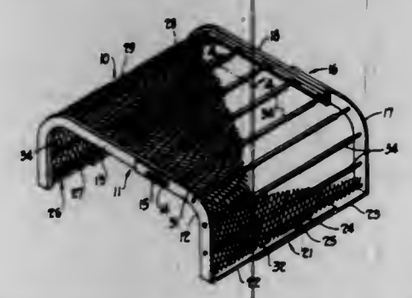
1. A detachable handle for cooking utensils having a projecting lug comprising a hand gripping portion, a fixed gripping jaw integral with the hand gripping portion, said fixed jaw having depending spaced flanges at opposite sides thereof, a movable gripping jaw pivoted intermediate its ends in the depending flanges of said fixed jaw, a stepped cam on the movable gripping jaw adjacent the hand gripping portion, and lever means pivoted in the fixed jaw adjacent the hand gripping portion and having cam engaging means adapted to ride on said stepped cam, said lever means extending through an opening in the fixed gripping jaw and adapted to be moved about a horizontal axis therein to move the end of the movable jaw remote from the lever toward and away from the end of the fixed jaw remote from the hand gripping portion.

3,272,548
WEEDING TOOL
John W. Taylor, 310 Forest Park Drive, Pensacola, Fla.
Filed Nov. 3, 1964, Ser. No. 408,513
3 Claims. (Cl. 294—50.9)



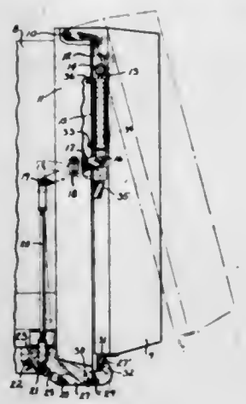
1. A weed pulling tool comprising, in combination, an elongated vertically extending handle member; a pair of normally closed gripping jaws attached to the lower end of said handle member; means pivotally mounting one of said jaws for movement toward and away from the other jaw, a trigger member pivotally attached to the upper end of said handle; a vertically extending elongated operating rod pivotally attached at one end to said trigger, lever means attached to said one jaw; said lever having an upstanding portion and a laterally offset portion extending in the direction toward said other jaw; means pivotally connecting said rod to said offset portion of said lever for moving one jaw away from the other; and horizontally positioned spring means attached to the upstanding portion of said lever urging said one jaw toward the other.

3,272,549
MATERIALS HANDLING DEVICE
David A. Nisula, Simsbury, Conn., assignor to General Electric Company, a corporation of New York
Filed Jan. 13, 1965, Ser. No. 425,190
11 Claims. (Cl. 294—64)



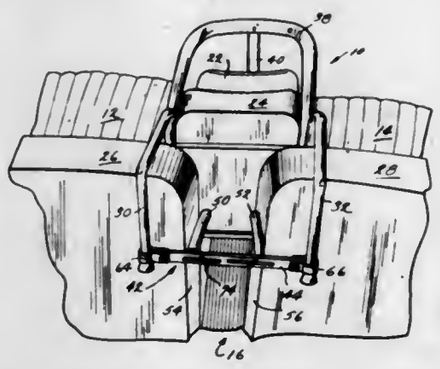
1. A sheet materials handling device comprising a resilient cup member, an aperture in said cup, means adapted to connect said aperture to evacuating means, and at least one pointed member rigidly depending from within said cup, each said member being disposed for its point to engage sheet material held to said cup by its evacuation.

3,272,550
WHEEL FOR RAILROAD
William H. Peterson, Homewood, Ill., assignor to Pullman Incorporated, Chicago, Ill., a corporation of Delaware
Filed July 22, 1965, Ser. No. 473,959
10 Claims. (Cl. 295—31)



1. A rail vehicle wheel for use on a rail, said wheel having a central portion and having an attached rail contact stress reducing tread portion having modulus of elasticity substantially lower in value than the modulus of elasticity of the rail material which is generally on the order of 29×10^6 p.s.i., and said tread portion having a hardness substantially of at least 10 on the Rockell "C" hardness scale.

3,272,551
THEFT-PROOF CAGE FOR AUTOMOBILE BODY TRUNKS
Alonzo R. Walker, Cleveland, Ohio, assignor of fifty percent to Anthony Viveiros, Cleveland, Ohio
Filed Aug. 26, 1964, Ser. No. 392,192
2 Claims. (Cl. 296—37)

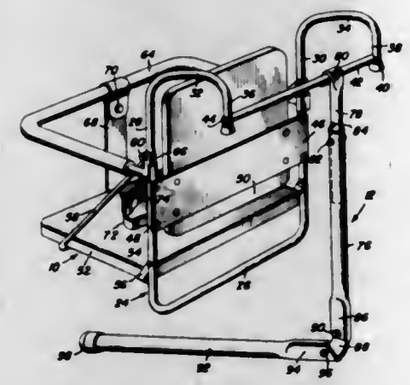


1. In combination with an automobile body trunk, a theft-proof cage, comprising, a frame member having two inverted, substantially U-shaped, flat, tubular channels spaced apart and joined through forward and rear base plates secured to the leg ends of the channels; each channel having a continuous track slot faced inwardly, toward the opposite channel, and aligned with the track slot thereof; a cover member, for the frame, having a plurality of ribs mounted cross-wise of the frame, between the channels, with their ends extending into opposite channel track slots; each rib having rollers journaled on the ends thereof, in the channel tracks, free to roll longitudinally thereof, the so mounted ribs being free to move toward or away from each other; the cover member also having a single length of flexible wire mesh secured to and supported on the upper surfaces of all the ribs, between the frame channels, and immovably anchored at its forward end to the frame member forward base plate, and releasably engageable at its rear end with the frame member rear base plate; the frame member being mountable in the trunk with its channels fitted against the side walls of the trunk, extending from the front to the rear thereof, and with its base plates bolted to the trunk floor; the cover member being movable longitudinally of the frame member channel tracks between a first, closed position wherein the cover member prevents access to the area of the trunk enclosed by the frame member, and a second, open, position wherein the cover member is retracted along the frame channel tracks to provide access to said area; and, means mounted on the rear frame base plate, engageable with the cover member, to prevent movement of the cover member from its first position to its second position, when so engaged.

3,272,552
LATCH AND TAILGATE OPERATING MECHANISM FOR TRUCK BODIES
Glenn S. Park, New Berlin, Wis., assignor to The Heil Co., Milwaukee, Wis., a corporation of Wisconsin
Filed Jan. 15, 1964, Ser. No. 337,853
7 Claims. (Cl. 296—56)

1. In combination with a truck body having mounted thereon a pivotal tailgate and a pivotal tailgate latch: a lever intermediately pivotally mounted on said body to rock in a vertical plane, mechanical connections extending from one end portion of said lever to the latch for actuating the latter, an hydraulic jack pivotally carried by the other end portion of said lever and extending to and engaging the tailgate, and stop means rigidly mounted on the body for limiting the rocking movement of said lever in one direction during which movement the mechanical connections actuate the latch following which the jack extends to pivot the tailgate.

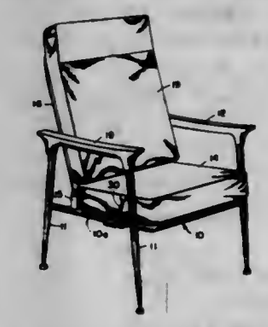
3,272,553
SAFEGUARD FOR CHILD'S SEAT
Dennis M. Burns, 143 Silver St., Dover, N.H.
Filed Mar. 18, 1965, Ser. No. 440,819
6 Claims. (Cl. 297—254)



1. A child's seat for mounting in bridging relationship between spaced, adjoining bucket seats in an automobile, said child's seat comprising:

a horizontal base for supporting a child in a sitting position, and a vertical back support connected to said horizontal base, said child's seat being of a size to bridge the space between adjoining bucket seats in an automobile;

attachment means connected to said vertical back support for suspending said child's seat from the bucket seats in said automobile; and

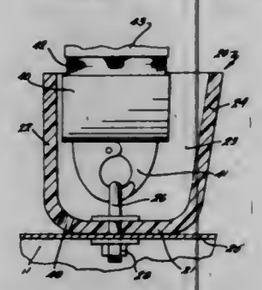


adapter means carried by the child's seat, said adapter means having projecting portions which can be fitted in the space between the two bucket seats to prevent lateral shifting of the child's seat when said child's seat is suspended from the bucket seats in a bridging relationship between the two bucket seats wherein said adapter means comprises a cross bar which bridges the two bucket seats, said cross bar being connected at its ends to the child's seat, and wherein said projection portions comprise two finger elements spaced from one another and projecting at right angles in the same direction from the cross bar, said two finger elements being mounted for adjustment toward and away from each other along the length of said cross bar.

3,272,554
CAR SEAT FOR INFANTS WITH SEAT ANCHOR
George M. P'Simer, Harvey Cedars, N.J., assignor to Holdtite Corporation, a corporation of New Jersey
Filed Dec. 29, 1964, Ser. No. 421,761
1 Claim. (Cl. 297—256)

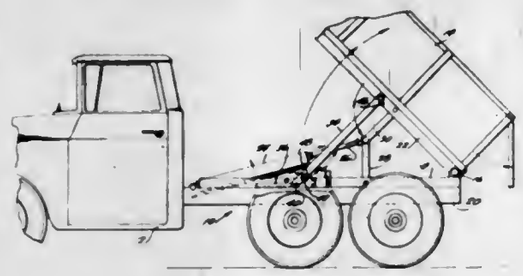
A car seat assembly for use on a vehicle having a split backrest seat assembly which includes a stationary seat portion and a pivotal backrest portion, an infant's car seat comprising a back frame adapted to extend along the front surface of the backrest portion of the seat assembly of the vehicle, said back frame including spaced hook-shaped elements at the upper end thereof adapted to engage over the upper portion of the backrest portion of the seat assembly, a back panel attached to said back frame, a seat panel attached to said back frame, and yoke retaining means attached to said back frame forming an assembly for receiving an infant whereby the infant is normally supported forwardly of the backrest portion of the seat assembly and is subjected to injury in the event the backrest portion of the seat assembly is pivoted forwardly due to sudden deceleration of the vehicle, an anchor assembly connected to the infant's car seat, said anchor assembly including a rail interconnecting the hook-shaped elements, an elongated vertically extending rigid member connected to the rail and adapted to extend downwardly alongside of the rear surface of the backrest portion of the vehicle seat assembly, and a forwardly extending generally horizontally disposed rigid member rigid with the lower end of the vertically extending member and generally equal in length thereto and adapted to extend forwardly in underlying relation to a major portion of the front to back dimension of the seat portion of the seat asembly, the backrest portion of the seat assembly thus being precluded from forward tilting movement, the upper end of said vertically extending rigid member being flattened and having a downwardly opening hook formed therefrom and in detachable engagement with said rail and retaining the vertically extending rigid member perpendicular thereto and preventing rotation about its longitudinal axis, said vertically extending rigid member including a pair of telescopic tubular members, means releasably securing the telescopic tubular members in longitudinally adjusted position, said means including alignable diametric openings in the tubular members and a fastening bolt extending through the openings to prevent relative rotation of the tubular members about a longitudinal axis, the lower end of the lowermost of said telescopic tubular members being flattened, said forwardly extending rigid member being tubular and having the rear end thereof flattened, the major dimension of the flattened rear end of the forwardly extending rigid member being substantially vertical and perpendicular to the rail, the major dimension of the flattened lower end of the vertically extending rigid member being disposed in substantially the same vertical plane as the major dimension of the flattened rear end of the forwardly extending member, and an angulated connector plate extending into and conforming with the flattened ends, and means releasably securing the connector plate to the flattened ends thereby retaining the forwardly extending rigid member in underlying relation to the seat portion of the seat assembly in generally perpendicular relation to the rail.

3,272,555
ADJUSTABLE BACK LOUNGE CHAIR
Chester J. Barecki and Robert T. Knapp, Grand Rapids, Mich., assignors to American Seating Company, Grand Rapids, Mich., a corporation of New Jersey
Filed Nov. 12, 1964, Ser. No. 410,358
2 Claims. (Cl. 297—369)



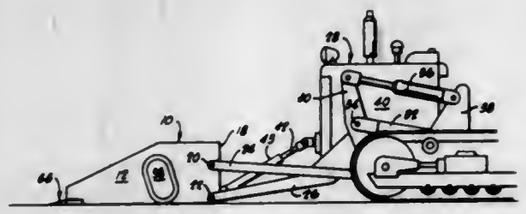
1. In a chair, a horizontal tubular seat frame, a cushion carried by said frame, legs supporting said frame and extending thereabove, armrests carried by said legs above said cushion, pivot standards mounted on said seat frame and extending upwardly therefrom, a back frame pivotally mounted on said standards, a cushion carried by said back frame, one side of said back frame being extended downwardly adjacent a tubular side member of said seat frame, said tubular member being provided on its inner side with a longitudinal slot, a pivot guide slidably mounted in said tubular member and provided at its rear end with a head and at its forward end with a cylindrical ratchet having its lower surface cut away to form downwardly-extending teeth, a pin extending through said slot and connecting said pivot guide head and said extended portion of said back frame, a spring within said tubular member engaging said head, pins extending through said tubular member and restricting forward movement of said spring, a pin extending through said tubular member and engaging a longitudinal slot within said ratchet member, a lever pivotally mounted on said tubular member and having a rearwardly-extending arm equipped with upwardly-extending tooth means, said tubular member being cut away to allow said tooth means to engage selectively said ratchet teeth for latching said ratchet in a plurality of longitudinal positions, and spring means normally urging said arm upwardly.

3,272,556
ADJUSTABLE BABY SEAT
Elmer Rocker, 2887 Falmouth Road, Shaker Heights, Ohio
Filed Apr. 2, 1964, Ser. No. 356,899
10 Claims. (Cl. 297—310)



1. In a baby seat or the like comprising a body having a back portion and a seat portion, support means including a first generally U-shaped wire frame having its ends pivotally journaled to a medial portion of said back portion substantially widthwise thereof and adapted to swing from a closed position adjacent said back portion to a position outwardly therefrom, and a second generally U-shaped wire frame having its ends pivotally journaled adjacent an end of said back portion substantially widthwise thereof and adapted to swing from a closed position adjacent said back portion to a position outwardly therefrom, said first U-shaped wire frame having opposed offset loops which are adapted to be engaged by the bight portion of said second U-shaped wire frame upon outward pivoting of said wire frames as aforesaid to interlock said wire frames, the entrance to said loops being of a shorter distance than the diameter of said second wire frame bight portion, whereby said loops must be sprung apart at their entrance to permit entry and removal of said bight portion, the corners defined by the juncture of the bight portion of said second generally U-shaped wire frame with the legs thereof having a resilient elastomeric coating means for frictionally engaging said loops.

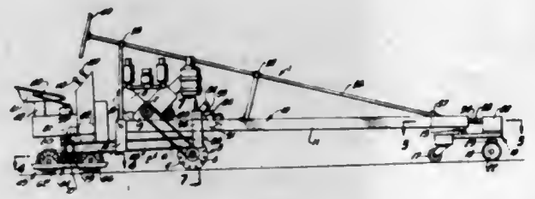
3,272,557
RECEIVER FOR BELT RETRACTORS
Arthur S. Nicholas, 915 Carrier Creek Blvd., Grand Rapids, Mich.
Filed July 9, 1964, Ser. No. 381,463
3 Claims. (Cl. 297—388)



1. In combination with an automotive vehicle having doors and a seat and personal retaining safety belts, said vehicle having a floor structure characterized by a central depressed portion in which said seats having seat and back cushions are located and an upstanding ridge along each side of said central portion between said seats and said door, a safety belt receiving means comprising: a cup-shaped receptacle having side walls and a bottom wall, the top thereof being open; an anchor member having one end within said receptacle and a shank extending through the bottom of said receptacle and means securing it to the top of said ridge with the top of said receptacle close to the top of said seat cushion; said one end having an enlarged portion extending outwardly therefrom to provide a bearing plate; a portion of the bottom wall of said receptacle being tightly clamped between said enlarged portion and said top of said ridge for fixedly locating said receptacle on said ridge; a spring loaded retractor on said safety belt receivable within said receptacle, one end of said safety belt being secured to said anchor member; said safety belt and said retractor being received within said receptacle except for the end portion thereof when said safety belt is retracted, said receptacle being of a flexible material of sufficient rigidity to support the weight of said retractor and belt.

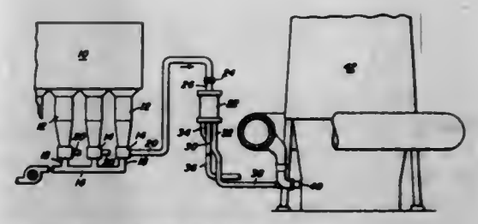
3,272,558
POSITIVE AUTOMATIC DUMP BODY HOIST SAFETY LOCK
Arthur B. Rathman, 520 S. 10th St., and Le Roy H. Rettke, 920 7th St. S., both of St. James, Minn.
Filed Nov. 16, 1964, Ser. No. 411,303
4 Claims. (Cl. 298—22)

1. A positive automatic hoist safety lock comprising a truck frame, a box frame, a hoist frame mounted on the truck frame and having hydraulic jack means on the hoist frame to raise the box frame, a channel mounted on the hoist frame, a locking bar pivotally mounted on the box frame at one end thereof and the other end slidably engaging along the channel on the hoist frame, said other end having a recess therein and continuing along said channel as the box is raised by the hydraulic jack until the box is hoisted, a locking bolt mounted on the hoist frame for engaging the recess at the other end of the locking bar when the box is hoisted to lock the box in the hoist position, a half-moon cam pivotally mounted on said locking bar for riding over a bolt on the hoist frame, a stop pin mounted on the locking bar to limit the displacement of said half-moon cam and allow the locking bar to override engagement of the locking bolt and return the free end of the locking bar into said channel while the box is being lowered onto the hoist frame.



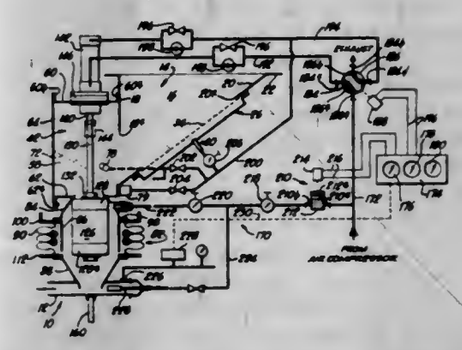
3,272,559
PAVEMENT CUTTING AND EARTH EXCAVATING DEVICE
Louis E. Haynes, 302 S. 6th St., Union City, Tenn.
Filed June 21, 1965, Ser. No. 465,611
42 Claims. (Cl. 299—37)

35. Excavating apparatus for removing a surface layer from the earth comprising:
a prime mover;



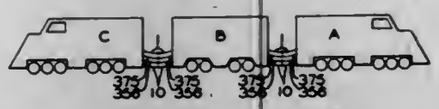
a power takeoff from said prime mover;
a framework having a top portion, a forward portion, a rear portion and a ground engaging portion;
a pair of outer hitch brackets mounted on the forward portion of said framework adjacent the sides of said framework and in horizontaol alignment with each other;
a central hitch bracket mounted on said framework toward the center thereof and vertically offset from the line of horizontal alignment of said outer hitch brackets whereby said framework can be pivoted about a horizontal axis extending through said outer hitch brackets by a hitch link connected to said central hitch bracket;
actuating means connected to said hitch brackets for actuating said hitch brackets to move said framework relative to a plane substantially coplanar with the surface of the ground over which said excavating apparatus is moved;
a plurality of cutter blades movably mounted on the forward portion of said framework in alignment with the ground engaging portion thereof;
dirt supporting means extending upwardly and rearwardly in said framework from a line in juxtaposition to the upper usrface of said cutter blades to receive material severed by said cutter blades and support and lift said material as it moves rearwardly with respect to said framework; and
power transmission means on said framework and having an input end connected to said power takeoff and an output end connected to said cutter blades for reciprocating at least two of said cutter blades on said framework in out-of-phase relation to each other and in a direction of movement advancing from. and returning to, the forward portion of said framework, said power transmission means including timing means adapted to move at least one of said blades forwardly with respect to said framework at a different time than the time at which another of said blades is moved forwardly with respect to said framework, said timing means being disposed beneath said dirt supporting means and to the rear of said cutter blades.

3,272,560
CONCRETE BUMP CUTTER WITH CARRIAGE LEVEL ADJUSTMENT
Cecil W. Hatcher, West Covina, Calif., assignor to Concut Inc., El Monte, Calif., a corporation of California
Filed June 6, 1963, Ser. No. 286,031
9 Claims. (Cl. 299—39)



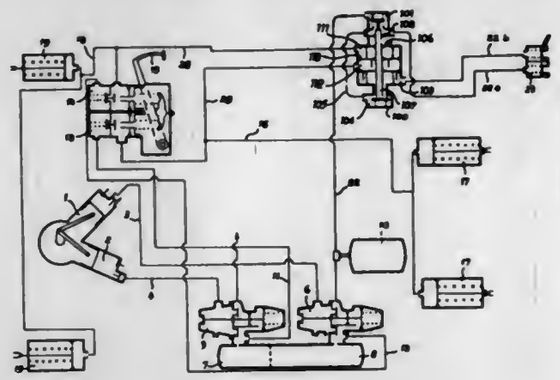
1. A concrete cutting machine comprising a main frame having a forward cutter head, an extension frame having a front vehicle wheel, said extension frame having a rear pivotal connection on said main frame, a rear truck having a drive shaft and front and rear vehicle wheels driven thereby, a universal bearing on opposite ends of said shaft, said main frame having opposite sides, and means for adjustably supporting each side of the rear of said main frame on one of said bearings, means for driving said cutter head, means for driving said drive shaft, and means for supporting the front of said main frame on an intermediate portion of said extension frame.

3,272,561
DISTRIBUTOR
John F. Farnsworth, Pittsburgh, and Somerled MacDonald, Sewickley, Pa., assignors to Koppers Company Inc., a corporation of Delaware
Filed May 21, 1963, Ser. No. 281,911
6 Claims. (Cl. 302—28)



1. A distributor comprising,
a cylindrical casing with end sections,
said casing having a pair of baffles,
said baffles bisecting each other along the axis of said cylindrical casing dividing said casing into symmetrical channels,
inlet means in one of said end sections,
the center of said inlet means coinciding with said axis,
the other of said end sections having outlet means for each channel, and
means connecting opposite outlet means to a common conduit thereby forming a pair of outlet conduits.

3,272,562
MATERIAL FEEDING APPARATUS
John H. Kauffman, Crystal Lake, Ill., assignor to Herbert Simpson Corporation, Chicago, Ill., a corporation of Illinois
Filed July 6, 1965, Ser. No. 469,826
13 Claims. (Cl. 302—55)

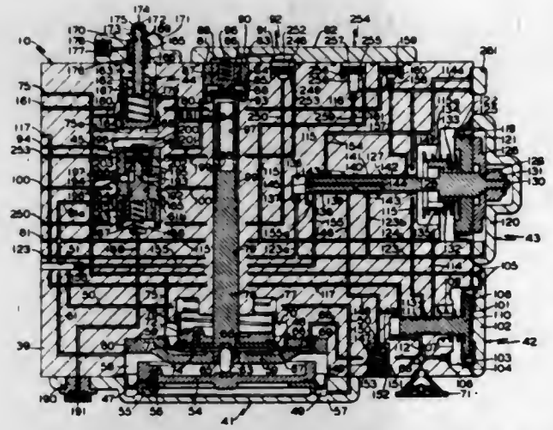


1. Apparatus for feeding material into a fluid conduit, said apparatus comprising a longitudinally expansible valve chamber, said valve chamber including an upper member having a material inlet at the upper end thereof and a valve seat adjacent said inlet, and a lower member having a material outlet therein delivering material to said fluid conduit, bellows means sealingly interconnecting said upper and lower members to permit relative movement between said members to change the effective volume of said chamber; valve means in said chamber including a valve element, means extending into said chamber for supporting said valve element coaxially within said chamber and reciprocally movable to alternately seat and unseat the valve element from said valve seat, operator means externally of said chamber for reciprocally moving said supporting means to effect said alternate seating and unseating, and adjustable support means interconnected between said upper and lower members for selectively adjusting the relative spacing therebetween.

3,272,563
COMBINED FLUID PRESSURE AND VACUUM VEHICLE BRAKE SYSTEM
Harry C. May, East McKeesport, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed Mar. 26, 1965, Ser. No. 442,855
14 Claims. (Cl. 303—4)

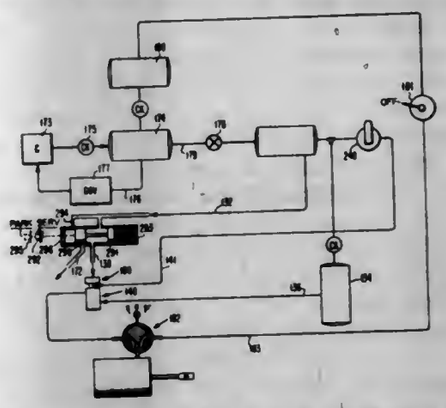
1. In a multiple unit locomotive brake control system comprising on each locomotive unit the combination of:
(a) a vacuum brake pipe extending from end to end of the respective locomotive unit and connected to a corresponding vacuum brake pipe on an adjacent locomotive unit,
(b) an exhauster and a storage reservoir evacuated thereby,
(c) a communication extending between the storage reservoir and said vacuum brake pipe,
(d) a fluid pressure brake pipe extending through the several locomotive units,
(e) a first fluid pressure operated valve means disposed in said communication and operable in response to variations of pressure in said fluid pressure brake pipe for controlling evacuation of fluid under pressure from said vacuum brake pipe in response to evacuation of the corresponding reservoir by operation of the exhauster on the respective locomotive, said valve means being also operable to vary the amount of fluid at atmospheric pressure admitted to said vacuum brake pipe from a chosen maximum to a chosen minimum accordingly as the pressure in said fluid pressure brake pipe increases from a chosen minimum pressure to a chosen maximum pressure,
(f) a source of fluid under pressure,
(g) a manually operable engineer's brake valve device for controlling the supply of fluid under pressure from said source of fluid under pressure to said brake pipe to effect the charging thereof up to said chosen maximum pressure and for controlling the release of fluid under pressure from said fluid pressure brake pipe to atmosphere to effect a reduction in the pressure therein,
(h) a pair of fluid pressure operated valve means interposed in series in said communication between the storage reservoir and said vacuum brake pipe, one disposed between the storage reservoir and said first fluid pressure operated valve means, and the other disposed between said first fluid pressure operated valve means and said vacuum brake pipe, said three valve means operative cooperatively for controlling the rate of evacuation of fluid under pressure from said vacuum brake pipe in response to evacuation of the corresponding reservoir by operation of the exhauster on the respective locomotive unit,
(i) a fluid pressure operated emergency relay valve device operable to effect venting of fluid under pressure from said fluid pressure brake pipe at an emergency rate to cause an emergency brake application, and
(j) a fluid pressure operated combined charging and break-in-two indication valve device operable so long as the pressure of fluid in said fluid pressure brake pipe is increasing at a rate in excess of a certain rate to effect the supply of fluid under pressure from said source of fluid under pressure to said pair of fluid pressure operated valve means on the corresponding locomotive unit to effect simultaneous operation thereof to effect, in cooperation with said first fluid pressure operated valve means, opening of said communication whereby fluid under pressure is evacuated from said vacuum brake pipe in response to evacuation of the corresponding reservoir, said fluid pressure operated combined charging and break-in-two indication valve device being also operable in response to the admittance of fluid at atmospheric pressure to said vacuum brake pipe at a rate in excess of a chosen rate as the result of rupture of said vacuum brake pipe to effect the supply of fluid under pressure from said source of fluid under pressure to said fluid pressure operated emergency relay valve device to cause the operation thereof.

3,272,564
AIR BRAKE VALVE
Romeo Romanini, Rivoli, Turin, Italy, assignor to Lancia & C. Fabbrica Automobili-Torino S.p.A., Turin, Italy
Filed Dec. 21, 1964, Ser. No. 419,709
Claims priority, application Italy, Jan. 8, 1964, 497/64
4 Claims. (Cl. 303—7)



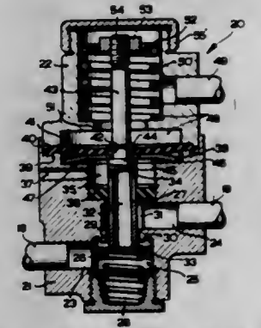
1. A tractor-trailer braking system comprising; first pressure means, automatic control valve means, tractor service line means connected to said first pressure means and said automatic valve means, second pressure means connected to said automatic valve means, trailer service conduit means and trailer emergency conduit means connected to said valve, said automatic valve means having first valve means normally connecting said second pressure means with said trailer emergency conduit means, second valve means normally connecting said trailer service conduit means to the atmosphere and pressure operated means responsive to an increase in tractor service conduit pressure to interconnect said trailer service conduit means with said trailer emergency conduit means and said second pressure means while closing said second valve means, said pressure operated means further responsive to a drop in pressure in said trailer service conduit means to close said first valve means while maintaining connection between said trailer service conduit means and said trailer emergency conduit means.

3,272,565
RAILWAY FLUID PRESSURE BRAKE APPARATUS
Richard L. Wilson, Trafford, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed Aug. 31, 1964, Ser. No. 393,166
12 Claims. (Cl. 303—8)



1. In a fluid pressure brake system for railway locomotives and cars, the combination of:
(a) a brake pipe normally charged with fluid at a certain pressure,
(b) a selector volume reservoir normally charged with fluid at said certain pressure, and
(c) a brake control valve device on the locomotive having:

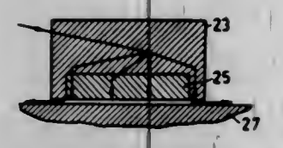
(i) a service valve device responsive, respectively, to a reduction in brake pipe pressure from said certain pressure to effect a brake application, and to an increase in brake pipe pressure to effect a brake release, and
(ii) selector valve means controlling a charging communication through which fluid under pressure may normally flow from the brake pipe to the selector volume reservoir, and two release communications of different flow capacities via which fluid under pressure may be released respectively from the brake pipe at a relatively slow rate and from the selector volume reservoir at a faster rate,
(iii) said selector valve means being subject opposingly to brake pipe pressure and selector volume reservoir pressure and responsive to an initial reduction in brake pipe pressure to below selector volume reservoir pressure at any rate to close said charging communication and open only that one of said release communications through which fluid under pressure may be released from said brake pipe, and
(iv) said selector valve means being responsive to a consequent reduction in brake pipe pressure effected by flow via the open one of said two release communications to effect opening of the other of said two release communications through which fluid under pressure may be released from said selector volume, and
(d) means for limiting the reduction in pressure in said selector volume reservoir to a chosen pressure, by flow through the other of said two release communications, which chosen pressure is less than the reduced brake pipe pressure subsequent to operation of said service valve device to effect a full service brake application.



3,272,566
COMBINED SERVICE AND EMERGENCY BRAKE SYSTEM APPARATUS
James H. Clack, 6145 Buckboard Drive, Rio Linda, Calif.
Filed Dec. 30, 1963, Ser. No. 334,505
14 Claims. (Cl. 303—13)

1. A brake system adapted to be carried by a motor vehicle comprising a cam shaft effective to actuate a brake shoe in a first direction of angular shaft rotation and to release a brake shoe in a second direction of angular shaft rotation, biasing means connected to said cam shaft for resiliently urging said cam shaft in said first direction, fluid pressure means connected to said cam shaft for overcoming said biasing means whereby said cam shaft is rotated in said second direction, pressure source means for supplying fluid under pressure to said fluid pressure means, means forming a fluid supply line path connecting the source means and said fluid pressure means, and valve means controlled by the operator of the motor vehicle for both service and emergency operation, said valve means being capable of selectively supplying fluid under pressure from said fluid supply source means to said fluid pressure means and subsequently selectively removing fluid from said fluid pressure means, said valve means being normally

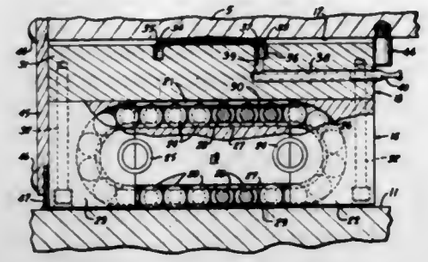
operatively responsive to fluid under pressure from said source serving to operate said valve means to normally condition said path to transmit pressure to said fluid pressure means and rotate said cam shaft in said second direction, and further operatively responsive to selectively apply a counteracting fluid pressure from said source to condition said path to remove fluid from said fluid pressure means and rotate said cam shaft in said first direction.



3,272,567
BRAKE INSTALLATIONS FOR TRAILERS
Oskar Vielmo, Stuttgart-Sonnenberg, Germany, assignor to Robert Bosch G.m.b.H., Stuttgart, Germany
Filed Oct. 7, 1964, Ser. No. 402,098
Claims priority, application Germany, Oct. 10, 1963, B 73,824
6 Claims. (Cl. 303—29)

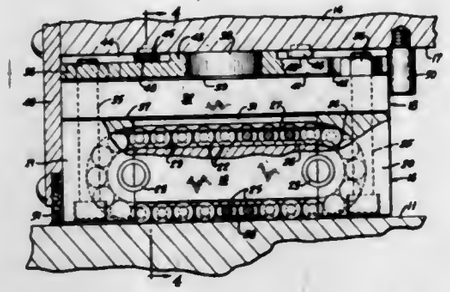
1. In a braking installation for a trailer which is adapted to be hauled by a motor truck, in combination, a plurality of pneumatic brake means and spring brake means adapted to brake wheels of the trailer; control valve means; filling and brake lines situated upstream of and communicting with said control valve means, said filling line being adapted to communicate with a source of compressed air at the motor truck and said brake line being adapted to transmit pressure changes resulting from operation of brakes of the motor truck; a compressed air tank carried by the trailer, said tank communicating with said control valve means; pneumatic brake conduit means communicating with said plurality of pneumatic brake means and situated downstream of and communicating with said control valve means, said control valve means maintaining compressed air in said tank at a pressure determined by the pressure of compressed air in said filling line and said control valve means responding to pressure changes in said brake line for applying to said plurality of pneumatic brake means compressed air from said

tank to apply the pneumatic brake means for retarding the movement of the trailer; spring brake conduit means communicating with said spring brake means and with said filling line upstream of said control valve means so that the compressed air flows from said filling line directly to said spring brake means and said spring brake means responding to the pressure of the compressed air derived from the filling line for remaining in an inoperative, non-braking position, while when said spring brake conduit means is at atmospheric pressure said spring brake means automatically responds to apply its braking force to the trailer for retarding the movement thereof; and flow control means communicating with said tank and connected into said spring brake conduit means and dividing the latter into an upstream portion extending from said flow control means to said filling line and a downstream portion extending from said flow control means to said spring brake means, said flow control means automatically placing said downstream portion of said spring brake conduit means in communication with the outer atmosphere when the pressure of the air in said tank falls below a predetermined value, so that said spring brake means will become operative to retard movement of the trailer when the pressure in said tank is below said value.



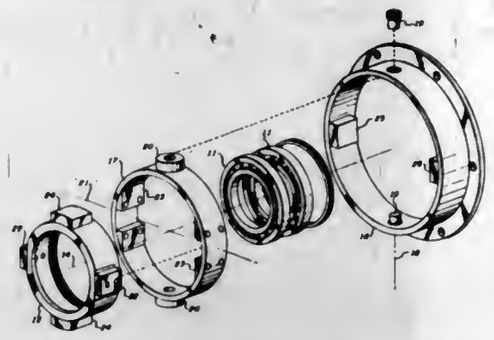
3,272,568
GUIDING DEVICES
Jacob Koörneef, Emmasingel, Eindhoven, Netherlands, Simon Duinker, Hamburg, Germany, and George Ludwig Walther, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed July 9, 1963, Ser. No. 295,282
Claims priority, application Netherlands, Mar. 28, 1962 276,532
9 Claims. (Cl. 308—5)

1. A system for guiding a part movable in a path relative to a supporting part comprising, a translationally movable body of relatively low mass having a substantially flat surface, a guide member having a substantially flat surface opposite the flat surface of said body for supporting said body, hydrostatic pneumatic means having openings in at least one of said surfaces for separating said body and said guide member throughout said path, and magnetic means urging said flat surfaces of said body and said guide member toward each other throughout said path for maintaining a given spaced relation therebetween, said given spaced relation being substantially equal to a similar space relation by a similar body having a significantly greater mass than the said body of low mass; said magnetic means comprising a composite body of soft steel portions separated by portions of ferromagnetic material.



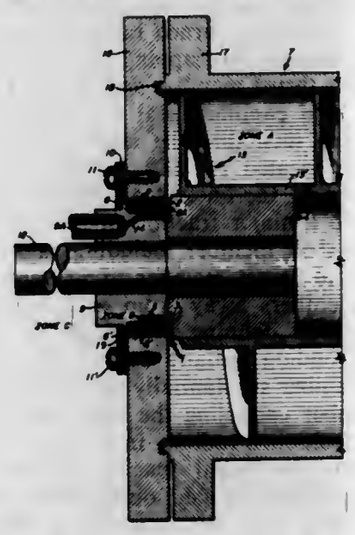
3,272,569
PNEUMATIC LOADING BEARING ARRANGEMENT
Alfred F. Mergen, Sun Prairie, Wis., assignor to Gisholt Corp., a corporation of Wisconsin
Filed Aug. 28, 1963, Ser. No. 305,139
5 Claims. (Cl. 308—6)

2. A roller-spring unit comprising,
(a) a roller bearing having a planar rolling surface and an opposite parallel planar mounting surface,
(b) a supporting body secured to the mounting surface having a cavity in the opposite body surface,
(c) an elastic diaphragm secured to the body overlying said cavity and defining a spring control chamber therewith, said diaphragm constituting a load receiving surface for supporting a member on the roller bearing, and



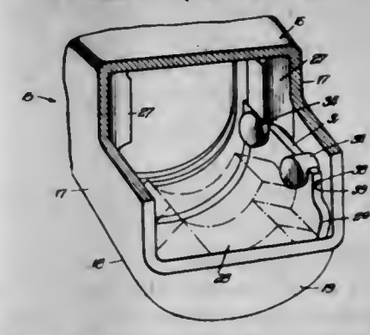
(d) an essentially incompressible material confined within said chamber under a pressure expanding said diaphragm, said material being compressed in response to loads applied to said diaphragm.

3,272,570
SPRING LOADED BEARING ARRANGEMENT
Robert R. Zenk, Cambridge, Wis., assignor to Gisholt Corp., a corporation of Wisconsin
Filed Oct. 1, 1963, Ser. No. 313,109
7 Claims. (Cl. 308—6)



1. A spring loaded rolling mounting assembly comprising
(a) a fixed support member having a planar supporting wall,
(b) a movable member having a planar wall,
(c) a recirculating roller bearing having a body with a back mounting wall and a plurality of recirculating cyclindrical rollers defining a planar rolling surface opposite the back mounting wall, said bearing being disposed on the fixed support member with the rollers on the planar supporting wall,
(d) a mechanical spring unit disposed between the movable member and the roller bearing, said spring unit including a first mechanical spring having a spring constant deflectable under initial loading and a pair of columns extending perpendicularly to the planar wall of the movable member and having a spring beam spanning and bearing upon said pair of columns, said beam constituting a spring having a substantially higher spring constant deflectable after substantially complete deflection of the first spring portion, and
(e) said spring unit having a crowned force transmitting surface establishing self-alignment of the load forces on the movable member to establish perpendicular forces on the spring unit and the roller bearing.

3,272,571
BEARING ASSEMBLY
William J. Ott, Great Neck, N.Y., assignor to Sperry Rand Corporation, Great Neck, N.Y., a corporation of Delaware
Filed Oct. 11, 1963, Ser. No. 315,585
10 Claims. (Cl. 308—26)

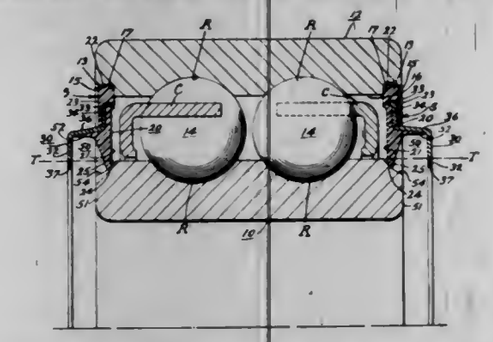


1. A vibration isolating bearing assembly including a bearing having a part movable about an axis, a coupling having three radially spaced elements arranged in concentric and coplanar relation to the bearing axis and in outside, intermediate and inside relation to one another for isolating the bearing from vibrations along the bearing axis, along a second axis normal to the bearing axis and along a third axis normal to the bearing and second axes, an axially spaced pair of slideable fastenings between the intermediate element and one of the other elements providing damping along the second axis and a rigid connection with relation to the bearing and third axes, an axially spaced pair of slideable fastenings between the intermediate element and the other of the elements providing damping along the bearing and third axes and a rigid connection with relation to the second axis, a pair of elastic members axially spaced along the second axis yieldingly connecting the intermediate element and the other of the elements, and a second pair of elastic members axially spaced along the third axis yieldingly connecting the intermediate element and the one of the elements.

3,272,572
DYNAMIC SEAL
Roger A. Lloyd, Huntsville, Ala., assignor to the United States of America as represented by the Secretary of Agriculture
Filed May 20, 1964, Ser. No. 369,042
2 Claims. (Cl. 308—36.1)

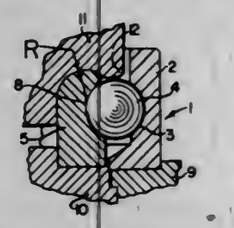
1. A dynamic seal for sealing a rotating shaft within a high pressure system and preventing contamination of said seal comprising in combination a rotating sealing ring member secured to said shaft, and a main stationary bearing member journaled on said rotating shaft, having at the outer circumference of said main bearing member a stationary ring sealing member, one side thereof bearing against said rotating sealing ring member, the other side thereof in intimate contact with a pliable static sealing ring, fluid pressure means urging against said pliable static sealing ring, anti-torque members providing a passage for said fluid pressure means against said rotating sealing ring transversely through said stationary ring seal members such that a relatively high fluid pressure is maintained within said seal and against said rotating sealing ring member.

3,272,573
JOURNAL BOX CONSTRUCTION FOR RAILWAY CARS
Edward Payson Smith, 1075 Pelham Road, Winnetka, Ill.; Erwin J. Hasten, Jr., 5934 Forest Glen, Chicago, Ill.; and David S. Neuhart, 9024 Jones Ave., Omaha, Nebr.
Filed July 5, 1963, Ser. No. 293,067
5 Claims. (Cl. 308—38)



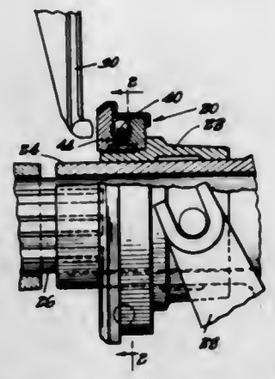
1. In a railway car journal box construction, a journal box having spaced vertical side walls with an axle journal in spaced relation therebetween, top and curved bottom walls interconnecting said side walls above and below said axle journal respectively, and a lubricant in said journal box; the improvement which comprises:
(a) a lubricant absorbing pad overlying said curved bottom wall, extending upwardly past diametrically opposite sides of said axle journal and having slotted ends,
(b) resilient block means extending upwardly from the upper side of said pad,
(c) a fabric overlying said resilient block means to transport the lubricant to the surface of said axle journal,
(d) journal stop means in said slotted ends of said pad interposed between the respective side walls of said journal box and the diametrically opposite sides of said axle journal to limit the movement thereof with respect to said side walls, and
(e) retaining means extending in parallel relation to said axle journal through said slotted ends of said pad and through said journal stop means to hold said journal stop means in said slotted ends,
(f) said journal stop means projecting beyond opposite sides of the respective ends of said pad whereby said slotted ends are spaced from the respective side walls of said journal box and the diametrically opposite sides of said axle journal.

3,272,574
SEAL FOR BEARINGS
Bruno A. Tassone, Philadelphia, and John L. Blake, Jr., Willow Grove, Pa., assignors to SKF Industries, Inc., King of Prussia, Pa., a corporation of Pennsylvania
Filed Feb. 10, 1964, Ser. No. 343,789
2 Claims. (Cl. 308—187.2)



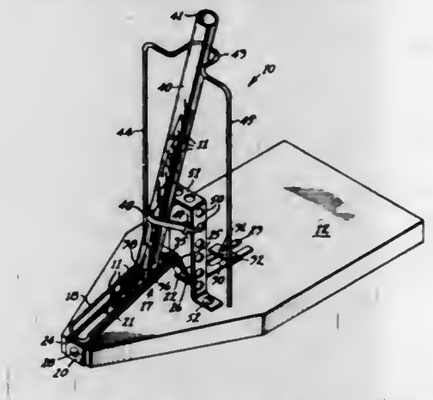
2. A bearing assembly comprising inner and outer rings, said outer ring having an inner circumferentially extending surface spaced from the outer peripheral sur-

face of the inner ring to define an annular space therebetween, a plurality of rolling elements in said annular space, means defining a circumferential groove in the inner peripheral surface of the outer ring adjacent opposite axial ends thereof, said inner ring having an arcuately chamfered circumferential surface at each axial end underlying said grooves in the outer ring, a seal detachably mountable adjacent each axial end of the annular space between the members, each seal comprising a ring-like casing having a rounded outer peripheral edge adapted to seat in said groove in the outer ring and a feathered radially inwardly directed portion having a tapered inner edge adapted to lightly engage the chamfered surface of the inner ring, a lubricant retaining member formed integrally with said casing comprising circumferentially extending offset inner and outer radial wall portions and an axial wall portion connecting the inner



and outer radial wall portions, said outer radial wall portion embedded in said casing and said axial wall portion projecting from the outer face of said casing away from said annular space at approximately the midpoint of said casing, said casing including a thin tapered web covering the inner peripheral surface of said axial wall portion, said axial and inner radial wall portions and said feathered edge portion of said casing defining a cup-like circumferential chamber of generally U-shaped cross section, the open side of said chamber confronting and overlying the axial end wall of the inner ring and the inner circumferential edge of said inner radial wall portion projecting below a circular plane through the outer peripheral surface of the inner ring whereby lubricant which purges by the inner feathered edge of the casing and which is thrown radially outwardly upon relative rotation of the rings is deposited in said chamber.

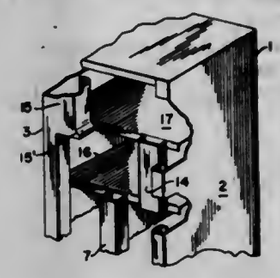
3,272,575
BALL BEARING ASSEMBLY
Michael Bushi, 3268 W. 33rd St., Cleveland, Ohio
Original application Feb. 21, 1962, Ser. No. 174,730. Divided and this application Mar. 9, 1964, Ser. No. 350,458
3 Claims. (Cl. 308—195)



1. A two-part ball bearing assembly having inner and outer race members, with one of said inner and outer race members having a preformed raceway having a radius approximately equal to that of said balls, the other of said inner and outer race members being in its preformed state generally cylindrical and formed with an annular ball-supporting shoulder and in its completely formed state axially compressed to form a raceway radius approximately equal to the radius of said balls to closely conform to the surface thereof, said other race member having a top exterior surface axially compressed to form a radius approximately equal to the radius of said balls.

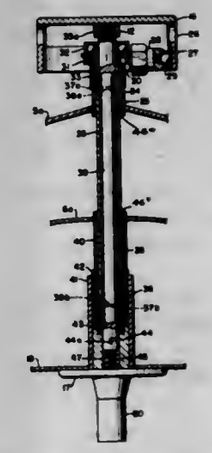
3,272,576
SEALED BALL THRUST BEARING
Daniel F. Greby, Maywood, Ill., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed May 4, 1965, Ser. No. 453,015
8 Claims. (Cl. 308—233)

1. A sealed ball thrust bearing comprising, in combination, two annular thrust members disposed in mutually confronting concentric relation for rotation relative to each other, said thrust members defining respectively two circular bearing ball races disposed in confronting relation to each other; an annular series of bearing balls disposed between said members in thrust bearing engagement with both of said races and being movable, in response to relative rotation of said thrust members, in an orbital path having an outer boundary; an annular bearing ball spacer disposed in concentric relation to said thrust members and including an annular series of spacer elements projecting radially outward between said thrust members in intervening relation between successive balls of said series of balls to maintain the balls in circumferentially spaced relation to each other, said spacer elements having radially outer extremities which terminate radially short of the outer boundary of said orbital path by distances which are major fractions of the radii of said balls, an outer annular shell member encircling said series of bearing balls in axially spanning relation to the space between said races, said outer shell member having two circumferential marginal edges one of which is sealably joined to one of said thrust members and the other of which is turned radially inward to form an annular lip slidably overlapping an axially outer surface on the other thrust member and forming a capillary seal therewith, said capillary seal extending radially inward to a degree such that the inner periphery of the capillary seal is located radially inward from the ball encircling portion of the outer shell member by a radial distance equal to a major fraction of the radius of each ball, said outer shell member including said lip thereon coacting with said thrust member to prevent movement of the thrust members away from each other, each of said thrust members defining a generally flat inner surface thereon extending radially outward from said race on the thrust member substantially to the portion of said outer shell member encircling the balls, said outer shell member being positioned radially in relation to said bearing balls so that the radial spacing of the individual balls from the portion of said outer shell member encircling the bearing balls between said thrust members does not exceed fifteen percent of the diameter of each bearing ball, an inner annular shell member disposed radially inward of said balls in concentric relation to said thrust members and in axially spanning relation to the space between said thrust members; said inner shell member having two circumferential marginal edges sealed to said respective thrust members, the seal between one of said thrust members and said inner shell member being formed by a capillary seal providing for free rotation of said one thrust member and said inner shell member in relation to each other; said thrust members and said inner and outer shell members as sealed together defining sealed internal void space through which said bills orbit in engagement with said races, and grease disposed in said void space and having a volume that is equal to at least twenty percent but not more than fifty percent of the volume of said void space.



3,272,577
DEVICE FOR DISPENSING STRAIGHT PINS
Woodrow W. Patterson, 3723 Princeton Ave., Nashville, Tenn.
Filed July 30, 1964, Ser. No. 386,292
3 Claims. (Cl. 312—42)

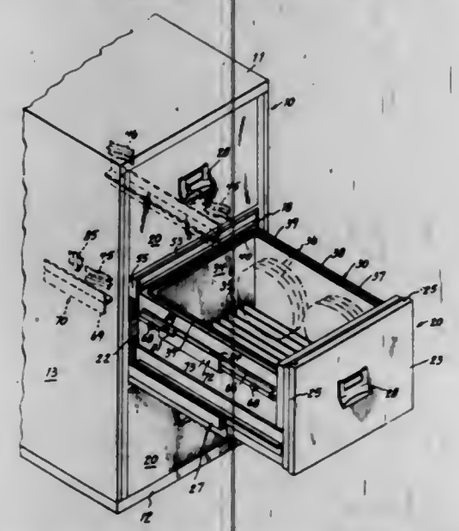
1. A straight pin dispensing device comprising:
(a) a base having a front end and a rear end,
(b) an elongated container having an upper open end and a lower open end,
(c) a plurality of straight pins, each pin having a first end and a second end, said pins being longitudinally received in said container with said first ends down,
(d) means for constraining said pins against end-over-end movement in said container,
(e) an elongated trough having an arcuate cross-section for receiving said pins, and having an upper end and a lower end,
(f) an elongated support member adjustably mounted on said base for holding said trough longitudinally inclined at an angle to the horizontal, with the lower end of said trough extending forwardly,
(g) means adjacent the upper end of said trough for supporting the lower open end of said container spaced vertically above said trough less than the length of each straight pin so that the first ends of said pins will engage said trough before said second ends leave said container,
(h) means on said base for supporting said container in an upright longitudinally inclined position, with the lower end of said container extending forwardly so that the first ends of said straight pins are directed from said container downwardly and forwardly.



3,272,578
LOCKER CONSTRUCTION
Robert G. Money, 7742 Little Mountain Road, Mentor, Ohio
Filed Sept. 9, 1964, Ser. No. 395,226
13 Claims. (Cl. 312—198)

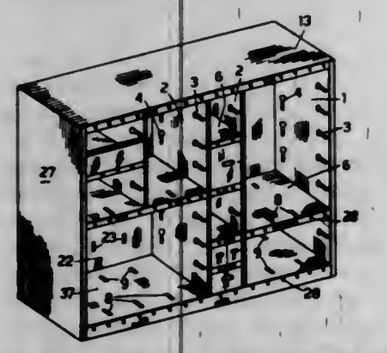
1. A locker construction for garments and the like comprising a plurality of first compartments positioned in side-by-side relationship having a common rear wall, a door for each compartment, a divider partition between said compartments, and a plurality of second compartments positioned above said first compartments, each of said doors extending vertically on opposite sides of said divider partition and enclosing said first and second compartments to permit access to said first and second compartments when

opened, and a closure plate positioned above one of said first compartments parallel to one of said doors and extending vertically between said first compartment and one of said second compartments to deny access to one of said second compartments when the door to the other of said second compartments is opened.



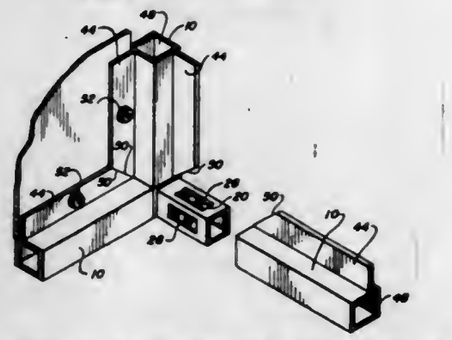
3,272,579
CRYOGENIC STORAGE VESSEL WITH STATION SELECTOR
Kenneth R. Leonard, Boulder, Colo., assignor to Cryogenic Engineering Company, Denver, Colo., a corporation of Colorado
Filed Aug. 24, 1964, Ser. No. 391,553
11 Claims. (Cl. 312—214)

1. A cryogenic storage vessel comprising an outer cylindrical member adapted to stand in an upright position and enclosed at its top and bottom, an inner storage container suspended within the outer member in spaced relation thereto and defining an evacuated insulation space therewith, a hollow member of low heat-conductivity fitted in sealed relation in openings in the outer member and inner container, a rotary shaft of low heat-conductivity extending through the hollow member from outside the outer member into the inner container through an upper portion of said insulation space and in spaced relation with the hollow member, an article support carried on the lower end of said shaft and having a series of support stations at its periphery, a tubular member extending from outside the outer member into the storage container in alinement with a selected station of the article support so as to provide an access passage thereto and interconnecting the outer member with the inner container as one point of suspension, the shaft providing a second point of suspension of the inner container from the outer member, a removable plug normally closing the access passage, and means at the upper end of the



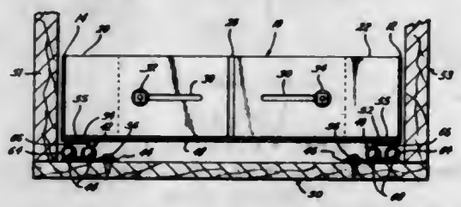
shaft for manual rotation to bring a selected support station in register with the access passage without removing the plug.

3,272,580
ARTICLE STORAGE EQUIPMENT
Lawrence R. Dean, Devola, Ohio, and Donald A. Gunn, Tonawanda, N.Y., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Aug. 26, 1964, Ser. No. 392,084
18 Claims. (Cl. 312—214)



1. A fire resistant storage device of the class described, comprising
(a) a casing having a compartment open at one side thereof and having the wall portions thereof composed of fire resistant material,
(b) closure means for selectively opening and closing said one side of said compartment,
(c) said closure means including a wall of fire resistant material, adapted to coact with said compartment wall portions to seal said compartment when closure means is in closed position,
(d) a storage container arranged within said compartment,
(e) a cover for said storage container, and
(f) means for maintaining said cover in hermetically sealed engagement with said container under conditions where said closure means is in said closed position.

3,272,581
STORAGE RACK
Jakob Stucki, Neulandenstr. 32, Wil, Switzerland
Filed Oct. 3, 1963, Ser. No. 313,463
Claims priority, application Switzerland, Oct. 6, 1962, 11,702/62
10 Claims. (Cl. 312—234.4)

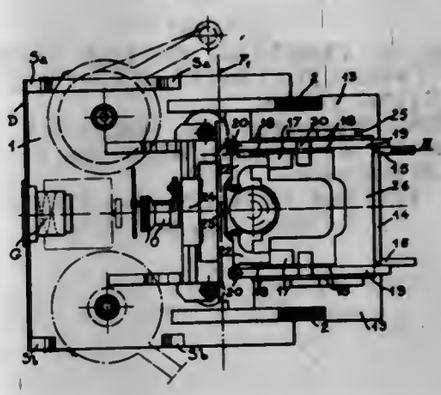


1. In a combinable storage rack comprising two sidewalls, a bottom sheet and a top sheet, intermediate shelves and cell floors adjustable in elevation and of different lengths, some of said cell floors being inclined, and partitions of different height spaced as desired and extending parallel to the sidewalls and also carrying cell floors, said partitions having retainers insertable in elongated holes of the cell floors, whereby may be formed cells of square or rectangular form of the most diversified sizes, either uniform or all the forms and sizes intermixed, the improvement comprising said sidewalls and partitions provided with uniformly spaced elongated holes disposed in series, said cell floors being provided with front and rear flanges, horizontal members for supporting the cell floors, said members being crimped in cross-section and adapted to be detachably secured to the sidewalls and partitions through said holes therein, the cell floors bearing on said members and engaging same from the rear with their rear flange and from the front with their front flange, and unequal angle irons welded to the underside of the cell floors and the top sheet to project therefrom with their unequal legs and to leave a gap between the latter substantially equal in width to the thickness of the partitions, the lower edges of said partitions having retainers inserted in said floor holes and said partitions being positioned with their top edge in said gap between said angle irons.

3,272,582
BUILDING COMPONENTS FOR CONSTRUCTING CABINETS
Edwin V. Anderson and Joseph A. Mack, Glenview, Ill., assignors to Amco Engineering Company, Chicago, Ill., a corporation of Illinois
Filed Dec. 17, 1964, Ser. No. 419,093
14 Claims. (Cl. 312—257)

6. In combination with building components of the type having legs of one member inserted with the hollow interior of other members, said legs each having one or more recesses formed therein, locking plate means comprising a central body portion having upstanding yieldably rigid locking tabs formed therein and a pair of offset side rails integrally formed therewith which are adapted to engage the surface of said legs with said central body portion disposed in said recess.

3,272,583
SLIDING ADJUSTABLE DRAWER
Edward P. Averdieck, 1508 Ennis St., Houston, Tex.
Filed Dec. 21, 1964, Ser. No. 419,678
5 Claims. (Cl. 312—343)



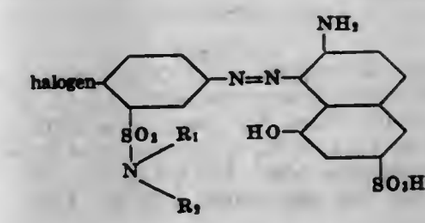
1. In an adjustable drawer for mounting on a cabinet shelf having side walls, said drawer having first and second sides connected together by front and back members which are adjustable in length, the improvement comprising,

slide means connected to each side member for attaching said drawer on said shelf.
supporting means extending inwarly from each side member for supporting a bottom member,
a bottom member adapted to be positioned on said supporting means thereby providing a drawer bottom, and
fastening means connected to the slide means for securing the slide means to said shelf, said fastening means positioned inwardly from said supporting means whereby the drawer may be fully expanded between the cabinet side walls and the fastening means secured to said shelf prior to positioning said bottom.

3,272,584
KINEMATOGRAPHIC PROJECTING APPARATUS INCORPORATING A SCREEN
Angelo Sturnich, 7 Rue Martin Seytour, Nice, France
Filed Nov. 18, 1963, Ser. No. 324,408
Claims priority, application France, Nov. 23, 1962, 7,135, Patent 1,344,587
6 Claims. (Cl. 352—123)

1. A kinematographic film projecting apparatus comprising a frame, an objective carried inside said frame, a divergent optic system located to the front and at a short distance from the objective inside the frame, means projecting a beam of light through and along the optical axis of the objective and optic system, a case in which the frame is slidably carried and including a screen forming front wall facing the divergent optic means in the frame, the case being open at its rear end to provide a passage for the frame between a front inoperative position and a rearwardly shifted operative position, two cylindrical rigidly interconnected spool holders carried by the frame the axes of which are parallel with each other and orthogonal with reference to the optical axis of the objective, coaxial film feeding spools having their axes aligned with the axis of one spool holder and slidingly carried inside the latter, coaxial film take up spools cooperating with the corresponding film feeding spools having their axes aligned with the axis of the other spool holder and slidingly carried inside the latter, and guides extending in parallelism with the spool holder axes and along which said spool holder axes are adapted to be shifted to make the medial cross-sections of the successive pairs of cooperating feed and take up spools enter a position for which they lie in a plane passing through said optical axis to hold the corresponding film in an operative position across said axis.

CHEMICAL



3,272,585
METHOD OF MARKING ANIMAL SKINS AND RESULTING PRODUCT
John W. Rafferty, Marblehead, and George T. Hodgson, Jr., Melrose, Mass., assignors to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts
No Drawing. Filed Apr. 15, 1963, Ser. No. 272,841
9 Claims. (Cl. 8—10)

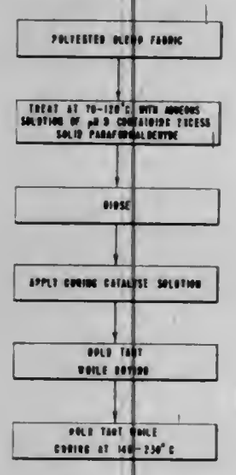
1. An ink suitable for permanently marking untanned animal skins and hides, consisting essentially of:
(a) a thixotropic gel-like, non-volatile, oxygenated hydrocarbon carrier medium soluble in water and the lower aliphatic alcohols and being further characterized as consisting essentially of a mixture of at least one liquid polyethylene glycol present in an amount equivalent to from 50 to 98% by weight of said carrier medium and at least one solid which is a polyethylene glycol or a copolymer of ethylene and propylene oxides forming the balance of said carrier medium; and
(b) an alcohol-soluble dye having a limited solubility in said carrier medium and suspended therein, said dye being present in a quantity in excess of that which is soluble in said carrier medium at normal room temperatures.

6. Method of permanently marking an animal skin, comprising the steps of:
(a) applying to the non-fur side of an untanned skin a dye suspended in an alcohol-soluble, gelled, non-volatile, oxygenated hydrocarbon carrier medium in which it has a limited solubility, wherein said carrier medium consists essentially of a mixture of at least one liquid polyethylene glycol present in an amount equivalent to from 50 to 98% by weight of said carrier medium and at least one solid which is a polyethylene glycol or a copolymer of ethylene and propylene oxides forming the balance of said carrier medium; and
(b) maintaining said carrier in contact with said skin for a period of time sufficient to cause it to penetrate into said skin and carry dissolved dye into said skin for permanent attachment to fibers thereof.

3,272,586
MIXTURES OF PHENYL SULFONAMIDO-HALOBENZENE AZO AMINO-NAPHTHOL SULFONIC ACIDS
Franz Frisch, Porza, Ticino, Switzerland, assignor to Sandoz Ltd., Basel, Switzerland
No Drawing. Filed Nov. 27, 1963, Ser. No. 326,354
Claims priority, application Switzerland, July 24, 1959, 76,170/59; June 30, 1960, 7,397/60
6 Claims. (Cl. 8—26)

1. As a composition of matter a mixture of two to three monoazo dyes, all of which correspond to the formula

wherein halogen represents a member selected from the group consisting of chlorine and bromine,
R_1 represents a member selected from the group consisting of hydrogen and low molecular alkyl, and
R_2 represents a member selected from the group consisting of phenyl, chlorophenyl, bromophenyl, low



molecular alkylphenyl, low molecular alkoxyphenyl and 2,3-tetramethylenephenyl; and wherein the radicals R_1 and R_2 possess together at least 7 and at the most 10 carbon atoms and the proportions of the two dyes of Formula I in the mixtures is from 80 to 20 parts of one dye of Formula I and 20 to 80 parts of the second dye of Formula I.

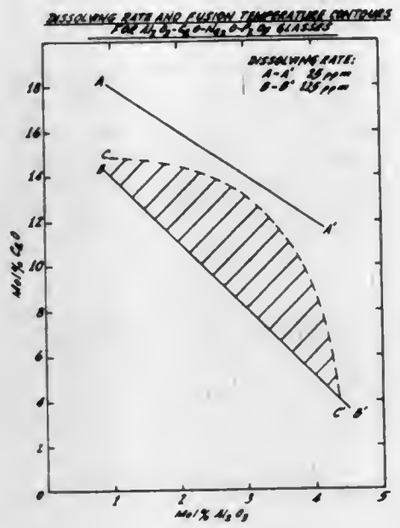
3,272,587

METHOD OF FINISHING TEXTILE FABRIC PREPARED FROM POLYESTER BLEND YARNS, AND RESULTING FABRIC

Roy T. Stiehl, Waynesboro, Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Sept. 12, 1961, Ser. No. 137,553
5 Claims. (Cl. 8—115.7)

1. In the process of treating with acid aqueous formaldehyde solution a textile fabric prepared from polyester blend yarns, the blend being a composite of 45% to 80% synthetic linear condensation polyester fibers and 20% to 55% fibers of the group consisting of cellulose, wool and nylon fibers, the improvement of wetting-out said fabric with at least 50%, based on the fabric weight, of a highly acid aqueous solution containing at least 40 parts formaldehyde per 100 parts by weight of solution and sufficiently strong, soluble, non-oxidizing acid to have a pH of less than about 0.5, heating the wet fabric for a period of at least 5 seconds at a temperature of 70° to 120° C., removing the unreacted formaldehyde and acid from the fabric, thereafter applying to the fabric a catalyst solution consisting essentially of a dilute aqueous solution of a non-volatile, non-charring acid, and, while applying tension to the wet fabric to prevent more than 5% shrinkage in any direction, drying and then heating the fabric at a temperature between about 140° and 230° C. for about 0.5 to 5 minutes.



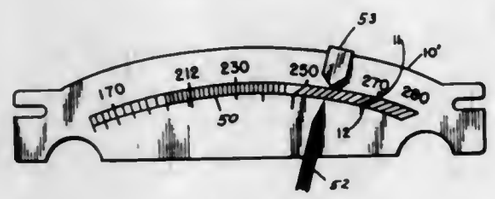
3,272,588

METHOD OF INHIBITING CORROSION WITH SLOWLY SOLUBLE PHOSPHATE GLASSES

Robert J. Fuchs, Clark, N.J., assignor to FMC Corporation, New York, N.Y., a corporation of Delaware

Original application Mar. 27, 1962, Ser. No. 182,870. Divided and this application July 23, 1962, Ser. No. 211,552
1 Claim. (Cl. 21—2.7)

The method of inhibiting the corrosion of metal in contact with water which consists essentially of adding to said water from about 1 to 125 p.p.m. of a polyphosphate glass having a fusion temperature between about 1148° F. and 1382° F. and a dissolving rate of from about 25 to 125 milligrams per liter, said polyphosphate glass containing from about 46.5 to about 48.5 mole percent P_2O_5, from about 35.5 to about 44.5 mole percent Na_2O,



from about 1 to about 4.25 mole percent Al_2O_3, and from about 4 to about 15 mole percent CaO.

3,272,589

TEMPERATURE SCALE FOR STERILIZER

Alfred B. Huston, Erie, Pa., assignor to American Sterilizer Company, Erie, Pa., a corporation of Pennsylvania

Filed Mar. 20, 1964, Ser. No. 353,441
1 Claim. (Cl. 21—98)

In combination, an autoclave adapted to carry out a processing cycle below a predetermined temperature and a sterilizing cycle above said predetermined temperature,

control means connected to said autoclave for controlling the temperature therein,

setting means for setting the temperature at which said autoclave is controlled by said control means,

a scale on said control means,

said scale having spaced calibration marks thereon,

said marks indicating temperature,

a setting pointer and an indicating pointer,

said setting pointer adapted to move over one end of said marks and said indicating pointer adapted to move over the other end of said marks,

the said marks indicating temperatures below said predetermined temperature being generally perpendicular to the path of movement of said pointer,

said marks above said predetermined temperature being inclined with regard to the path of movement of said pointer,

the ends of said marks above said predetermined temperature having their ends spaced from each other in a direction parallel to said path of movement of said indicating pointer in an amount equal to a predetermined differential temperature.

3,272,590

SEPARATION OF Hf AND Zr VALUES BY SOLVENT EXTRACTION

William H. Owens, Milton, Fla., assignor, by mesne assignments, to Pittsburgh Plate Glass Company

No Drawing. Filed Mar. 15, 1962, Ser. No. 180,045
4 Claims. (Cl. 23—22)

1. In the process of separating titanium from the group consisting of hafnium and zirconium wherein a water-insoluble organic solvent solution of hafnium and zirconium values containing titanium values as a contaminant which normally remains dissolved in said solutions of hafnium and zirconium is introduced into a extraction system comprising countercurrent flowing liquid components consisting of an aqueous acid phase and a water-insoluble organic solvent phase, the improvement for preventing contamination of said hafnium and zirconium values in said organic solvent phase which comprises introducing a peroxidizing agent into said extraction system with said aqueous acid phase of said system in an amount of one mole of said peroxidizing agent to approximately two moles of the titanium value content of said solution of hafnium and zirconium values, separating said organic solvent and aqueous acid phases, recovering said organic solvent phase containing at least said zirconium values substantially free of said titanium contaminant, and recovering said aqueous acid phase containing substantially all of said titanium contaminant.

3,272,591

PRODUCTION OF SINGLE CRYSTALS FROM INCONGRUENTLY MELTING MATERIAL

Robert G. Rudness and Richard W. Kebler, Indianapolis, Ind., assignors to Union Carbide Corporation, a corporation of New York

Filed May 8, 1959, Ser. No. 811,905
4 Claims. (Cl. 23—50)

1. A process for growing a boule containing a unicrystalline section of yttrium iron garnet ($3Y_2O_3 \cdot 5Fe_2O_3$) comprising (1) preparing a supply of yttrium iron garnet feed material, (2) passing the yttrium iron garnet feed material through a heated zone which is coaxial to an accumulation support, (3) heating said yttrium iron garnet feed material to establish a liquidus composition, (4) maintaining the liquidus composition between the eutectic and peritectic points on an equilibrium phase diagram of $YFeO_3$ and Fe_2O_3 and at a temperature from about 1440° C. to about 1580° C. while accumulating yttrium iron garnet crystal on said support from the liquidus composition, (5) gradually providing relative motion between said support and heated zone and (6) recovering a boule containing a unicrystalline section of yttrium iron garnet.

3,272,592

PREPARATION OF REDUCED VALENCY TRANSITION METAL FLUORIDES

Frank P. Gortsema, Ossining, N.Y., and Rostislav Didchenko, Middleburg Heights, Ohio, assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed July 28, 1964, Ser. No. 385,802
9 Claims. (Cl. 23—88)

1. A process for the preparation of lower valency metal fluorides selected from the group consisting of vanadium, niobium, tantalum and tungsten fluorides, said process comprising the steps of:

(a) forming in an inert atmosphere a mixture comprising a first metal fluoride compound wherein the metal is characterized by a valence higher than that of the desired metal fluoride, and a reducing agent selected from the group consisting of silicon, phosphorous and arsenic;

(b) heating said mixture in an inert atmosphere to a temperature and at a pressure sufficient to prevent volatilization and to reduce said first metal fluoride compound to said lower valency metal fluoride and

(c) thereafter lowering the temperature and pressure of said mixture to volatilize fluorides of said reducing agent.

3,272,593

PROCESS OF REDUCING THE CAKE-FORMING TENDENCY OF POTASSIUM CHLORIDE AND COMPOSITION CONTAINING SAME

Basil S. Fee, Sarnia, Ontario, Canada, assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed May 4, 1964, Ser. No. 364,774
6 Claims. (Cl. 23—89)

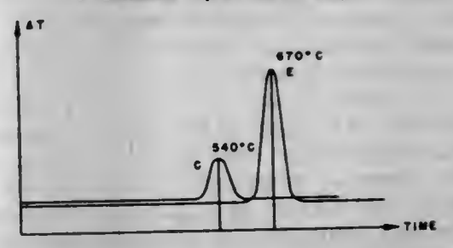
1. A method of reducing the cake-forming tendency of potassium chloride which comprises contacting said potassium chloride with up to about four percent by weight of diethylene glycol.

3,272,594

PREPARATION OF MAGNESIUM TRISILICATE

Yoshio Uyeda, San Mateo, Calif., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Continuation of application Ser. No. 152,077, Nov. 13, 1961. This application Oct. 22, 1965, Ser. No. 502,290
7 Claims. (Cl. 23—110)



1. The continuous method of producing magnesium trisilicate having enhanced physical charcteristics which comprises continuously and concurrently adding an aqueous alkali metal silicate solution and an aqeous solution of magnesium salt to a reaction vessel, said solutions being added at such rates as to form a precipitate of magnesium trisilicate and to constantly maintain in the mother liquors 0.0008–0.025 moles of said magnesium salt per liter of said mother liquors, withdrawing the precipitate and mother liquors from the reaction zone, and filtering the magnesium trisilicate product from the mother liquors.

3,272,595

METHOD OF PREPARING MAGNETIC ACICULAR GAMMA IRON OXIDE

Charles Maho, Mechelse Steenweg 119, Hove-Antwerp, Belgium

Filed Jan. 11, 1962, Ser. No. 165,610
Claims priority, application Netherlands, Jan. 13, 1961, 260,059
7 Claims. (Cl. 23—200)

1. A method for preparing magnetic acicular γ-Fe_2O_3 with improved thermal stability from Fe_3O_4 comprising the steps of

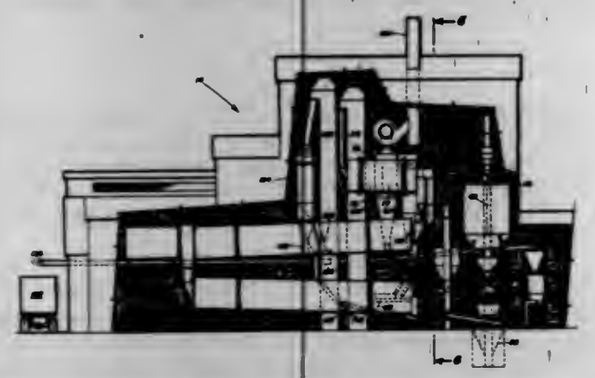
(a) precipitating an iron (II) salt from an aqueous solution by means of a strong base, said precipitation being carried out in the presence of a compound of a metal selected from the group consisting of molybdenum, and tungsten;

(b) oxidizing the acicular iron (II) hydroxide formed in step a to acicular $Fe_2O_3 \cdot H_2O$ nuclei by blowing air through the suspension obtained in step (a);

(c) adding the suspension obtained step (b) to a solution of an iron (II) salt and treating this composition with air in the presence of iron metal, to enable the $Fe_2O_3 \cdot H_2O$ nuclei to grow;

(d) separating and drying the acicular $Fe_2O_3 \cdot H_2O$ particles obtained in step (c);

(e) dehydrating the acicular $Fe_2O_3 \cdot H_2O$ whilst heating and reducing it between 300 and 450° C. to acicular Fe_3O_4; and



(f) oxidizing at 300–400° C. the Fe_3O_4 to magnetic acicular γ-Fe_2O_3 by means of a gas containing free oxygen.

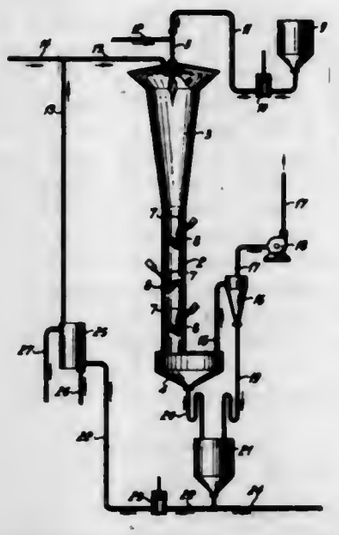
3,272,596

APPARATUS FOR MANUFACTURING FERTILIZER

Walter J. Sackett, Sr., Baltimore, Md., assignor to The A. J. Sackett & Sons Company, Baltimore, Md., a corporation of Maryland

Original application Sept. 14, 1962, Ser. No. 223,614, now Patent No. 3,189,434, dated June 15, 1965. Divided and this application Dec. 11, 1964, Ser. No. 417,568
1 Claim. (Cl. 23—259.1)

A system for the manufacture of granular fertilizer, comprising means for preparing a batch of a predetermined amount of raw material ingredients for said granular fertilizer, first conveying means for receiving said batch and blending it during conveying, an ammoniator-granulator treating the blending batch with ammonia and acid and graulating the blended batch, pre-classifying screen means classifying the granules so formed into first oversize, intermediate, and fine groups of granules, second conveyor means returning said first oversize and fine groups of granules to said ammoniator-granulator, means including rotary cylinders for drying and cooling said first intermediate group of granules by exposure to currents of air, screen means classifying the dried and cooled first intermediate group of granules into second oversize, intermediate, and fine groups of granules, a mill, third conveyor means transferring said second oversize group of granules to said mill and then to said screen means, a fines splitter adding a pre-determined proportion of said second fine group of granules to said second intermediate group of granules, fourth conveyor means transferring the remainder of said second fine group of granules to said ammoniator-granulator, and means including a pair of cyclones connected in series for recovering fine granules entrained in said currents of air passing through said rotary cylinders and returning the recovered fine granules to said ammoniator-granulator.



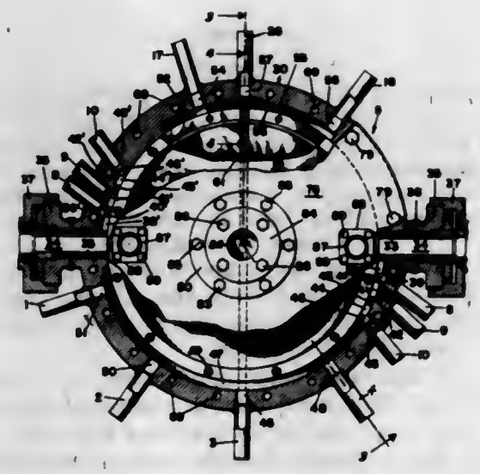
3,272,597

APPARATUS FOR PRODUCING HIGHER POLYPHOSPHORIC ACIDS

Klaus Beltz, Liblar, Germany, and Franz Rodis, deceased, late of Bad Hersfeld, Germany, by Hildegard Rodis, nee Arend, heiress, Bad Hersfeld, Germany, and Herbert Panter, Bruhl, near Cologne, Germany, assignors to Knapsack-Griesheim Aktiengesellschaft, Knapsack, near Cologne, Germany, a corporation of Germany

Original application Mar. 3, 1961, Ser. No. 93,135, now Patent No. 3,193,350, dated July 6, 1965. Divided and this application Mar. 8, 1965, Ser. No. 439,519
4 Claims. (Cl. 23—277)

1. An apparatus for preparing a higher polyphosphoric acid by burning elementary phosphorus with at least one substance selected from the group consisting of air and oxygen-containing gases, followed by absorption of the resultant P_2O_5 in lower polyphosphoric acids, said apparatus comprising a reaction tower having a combustion zone and an absorption zone, a collecting vessel disposed below said reaction tower, an acid circulating system, a downwardly directed nozzle at the upper end of said tower for feeding phosphorus into said combustion zone, a rotating atomizer at said upper end of said tower, said atomizer having a hollow rotation shaft, said nozzle extending through said atomizer shaft for atomizing lower



polyphosphoric acid in the direction toward said upper end of the lateral tower walls, means being in said absorption zone for particularly removing polyphosphoric acid which is flowing down on the tower walls, mechanical means for dividing said acid into particles of high velocity within said absorption zone, said mechanical means being a plurality of rotating atomizers disposed one above the other, and a plurality of baffles being disposed to direct flowing liquid on the walls into said rotating atomizers.

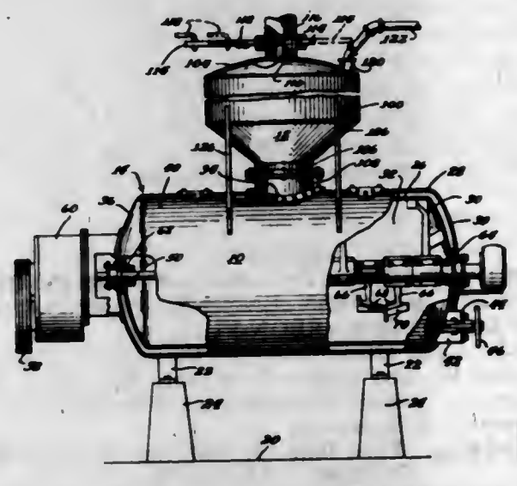
3,272,598

WAVE REACTOR

William B. Hansel, Media, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Filed Mar. 9, 1964, Ser. No. 350,463
5 Claims. (Cl. 23—284)

1. In a wave reactor, a disc-like rotor having a single straight channel extending transversely to the axis of the rotor and along a diameter of the disc; a stationary port ring closely surrounding said rotor, ma ns providing a



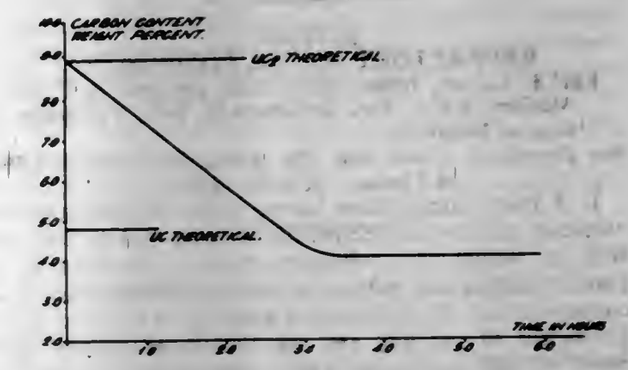
pair of diametrically-opposite driving gas inlets in said ring, said ring having therein at least one pair of diametrically-opposite driving gas outlets; said ring also having at one side thereof, in its inner cylindrical surface, a first arcuately-elongated continuous groove and having at the opposite side thereof, in its inner cylindrical surface, a second arcuately-elongated groove; means providing, in the inner cylindrical surface of said ring, a narrow sampling slot which lies entirely within the confines of said first groove and which is substantially isolated from said first groove, said slot having a cross-sectional area small compared to that of said first groove and being located intermediate the ends of said first groove; an outlet conduit sealed into said ring and communicating through said ring with said first groove, and an inlet conduit sealed into said ring and communicating through said ring with said second groove; said rotor being rotatable to bring one end of said channel, during 180° of rotation of said rotor, successively into communication with a driving gas inlet, a driving gas outlet, and said first groove and outlet conduit, said end of said channel also coming into communication with said sampling slot during its time of communication with said first groove, and to bring the other end of said channel, during the same 180° of rotor rotation, successively into communication with a driving gas inlet, a driving gas outlet, and said second groove and inlet conduit.

3,272,599

RENDERING COOKER WITH HYDROSTATIC CHARGING HEAD

Norman J. Allbright, Hinsdale, Ill., and Alvyn C. Boldon, % Faber Industries, 109 S. Monroe St., Peoria, Ill.; said Allbright assignor to said Boldon

Filed Nov. 5, 1962, Ser. No. 235,273
6 Claims. (Cl. 23—290.5)



1. A rendering cooker designed for the batch rendering of moisture-containing animal matter by evaporation of moisture therefrom and comprising a cooker shell defining an internal rendering chamber and provided with a discharge opening in the lower portion thereof and an inlet opening in its upper portion, a door associated with said discharge opening and movable between open and closed positions, a steam jacket substantially surrounding said shell and in direct heat transfer relationship therewith, a combined charging head and flash tank positioned above said cooker shell and defining an internal charging chamber, said charging chamber being continuously in communication with said rendering chamber through said inlet opening, the volumetric capacity of said internal charging chamber being at least equal to the volume of moisture to be extracted from the animal material in the rendering chamber when the latter is full, said combined charging head and flash tank being provided with a charging opening and a moisture outlet opening in the upper portion thereof, a closure member associated with said charging opening and movable between open and closed positions, said charging chamber being adapted, when the rendering chamber is completely filled with material to be rendered, to retain a reserve quantity of the material in the form of an hydrostatic head of the material for gravity flow into the rendering chamber during extraction of moisture from the material in the rendering chamber, said moisture outlet being provided with means whereby it may be operatively connected to a source of sub-atmospheric pressure, and means for agitating the material within said rendering chamber.

3,272,600

METHOD OF PRODUCING NUCLEAR FUEL MONOCARBIDES FROM HIGHER CARBIDES

Ronald George Sowden, Wallingford, and Neville Hodge, Oulton, Stone, England, assignors to United Kingdom Atomic Energy Authority, London, England

Filed Dec. 18, 1963, Ser. No. 331,415
Claims priority, application Great Britain, Dec. 21, 1962, 48,448/62
10 Claims. (Cl. 23—344)

1. A method for the production of fuel material monocarbides selected from the group consisting of uranium monocarbide, plutonium monocarbide and mixtures thereof, such method comprising the step of reacting a fuel material higher carbide selected from the group consisting of uranium sesquicarbide, uranium dicarbide, plutonium sesquicarbide and mixtures thereof with hydrogen at a temperature of not less than 1000° C. in the substantial absence of oxygen and water vapour.

3,272,601

PREPARATION OF BINARY COMPOUNDS OF URANIUM AND THORIUM

Wilford N. Hansen, Thousand Oaks, Calif., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Filed Mar. 3, 1964, Ser. No. 349,173
9 Claims. (Cl. 23—349)

1. A method for converting uranium or thorium metal into a binary compound selected from the class consisting of carbides, nitrides, and oxides, which comprises dissolving said metal in mercury to form said metal quasi-amalgam reaction product, and then distilling the resulting quasi-amalgam with a preselected gas from the class consisting of hydrocarbon gases, ammonia, and oxygen, whereby the metal is separated from the mercury and there is obtained the corresponding binary compound selected from the class consisting of carbides, nitrides, and oxides.

3,272,602
METHOD OF PRODUCING URANIUM DIOXIDE POWDER
Yoshiyuki Suehiro, 2–212 Moto-machi, Urawa-shi, Saitama-ken, Japan; Akio Takashima and Takashi Suzuki, both of 1–190 Kitabukuro-machi, Omiya-shi, Saitama-ken, Japan; and Hidekazu Doi, 359 Oaza-Sakawa, Urawa-shi, Saitama-ken, Japan
No Drawing. Filed Dec. 9, 1960, Ser. No. 74,749
4 Claims. (Cl. 23—354)

1. A method of producing uranium dioxide powder of an O/U mol ratio of about 2.00 having homogeneous particles of between about 2 to about 150 microns and a particle density of at least 98% comprising the steps of

precipitating ammonium diuranate from an aqueous solution of refined uranyl salt of less than 100 grams per liter by the addition aqueous ammonia of a concentration of about 28% or less at a rate of about 200 grams of ammonia per kilogram of said uranium per minute or less so as to obtain a sufficiently quantative uranium precipitation;

drying and thermally decomposing the precipitate ammonium diuranate at a temperature below 900° C. into material selected from the group consisting of uranium trioxide and triuranium octoxide; and,

reducing and sintering said material in a current of hydrogen gas at a temperature of between about 1200° C. to about 1750° C.

3,272,603
REFRACTORY METAL COMPOSITE
Earl I. Larsen, Indianapolis, Ind., assignor to P. R. Mallory & Co., Inc., Indianapolis, Ind., a corporation of Delaware
No Drawing. Filed Jan. 23, 1964, Ser. No. 339,586
6 Claims. (Cl. 29—191)

1. A metal composition having improved resistance to oxidation at elevated temperatures composed of 20% to 90% by weight of a refractory metal in the form of a porous matrix, the balance of the composition being a copper-yttrium alloy containing from about 0.1% to 1.0% by weight of yttrium, and the remainder copper, said pores of said refractory metal substantially filled with said copper-yttrium alloy.

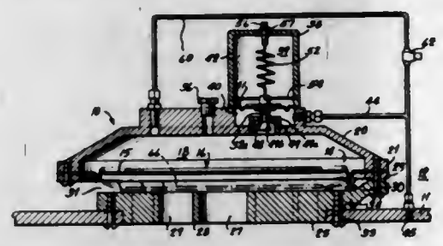
3,272,604
RE-IGNITIBLE MATCH
John Burton Tigrett and Voorhis F. Wigal, both of Jackson, Tenn.; said Wigal assignor to said Tigrett
Filed Dec. 9, 1965, Ser. No. 512,751
10 Claims. (Cl. 44—42)

1. A re-ignitible match having a combustible portion comprising an oxidizing agent from the class consisting of chlorates, perchlorates, nitrates and chromates, a combustion rate modifying agent from the class consisting of polymers of aldehydes and ammonia derivatives, a combustion supporting agent consisting of manganese dioxide, a binder from the class consisting of cellulose nitrate and cellulose acetate and a liquid monomeric agent capable of polymerizing in situ for forming a dense non-porous, homogeneous mass for dispersion therein of the match ingredients, said agent being from the class consisting of mono-methyl methacrylate, styrene, vinyl chloride, acrylonitrile, and methyl acrylate, ethyl methacrylate, and iso butyl methacrylate.

3,272,605
FUEL OILS
Henry A. Ambrose, Penn Township, Allegheny County, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
No Drawing. Filed May 18, 1951, Ser. No. 227,108
6 Claims. (Cl. 44—51)

1. A fuel oil composition comprising a major amount of a residual fuel oil yielding a corrosive vanadium-containing ash upon combustion and a minor amount, sufficient to retard the corrosiveness of said ash, of a metal-containing organic compound selected from the group consisting of oil-soluble and oil-dispersible metal salts of an acidic organic compound, the metal of said metal salts being selected from the group consisting of the metals of Group I and calcium.

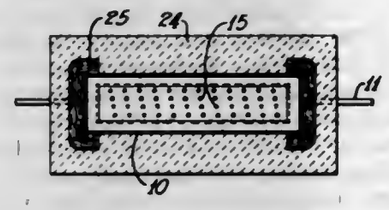
3,272,606
ANTIKNOCK COMPOSITIONS
Jerome E. Brown, Detroit, Mich., and Hymin Shapiro and Earl G. De Witt, Baton Rouge, La., assignors to Ethyl Corporation, New York, N.Y., a corporation of Virginia
No Drawing. Filed Aug. 18, 1958, Ser. No. 755,401
3 Claims. (Cl. 44—69)



1. A spark ignition internal combustion engine fuel composition consisting essentially of petroleum hydrocarbons boiling within the gasoline boiling range and having a motor octane number when clear of at least about 76, containing an antiknock amount of an organolead antiknock agent selected from the class consisting of alkyllead antiknock agents and aryllead antiknock agents, said antiknock amount being equivalent to from about 0.158 to about 4.86 grams of elemental lead per gallon, having a small amount, sufficient to provide a synergistic octane quality improvement in combination with said organolead compound, but insufficient in itself to materially raise the octane number of the unleaded base gasoline, of a mononuclear aromatic molybdenum tricarbonyl wherein the aromatic portion is an aromatic hydrocarbon molecule, said small amount being equivalent to from about 0.003 to 0.150 gram of elemental molybdenum per gallon.

3,272,607
METHOD OF REDUCING RING WEAR IN COMPRESSION IGNITION ENGINES BURNING RESIDUAL HYDROCARBON FUEL
Everett N. Case, Homewood, and Seymour H. Patinkin, Chicago, Ill., and Hobert D. Young, Hammond, Ind., assignors to Sinclair Research, Inc., Wilmington, Del., a corporation of Delaware
No Drawing. Filed June 15, 1962, Ser. No. 202,700
7 Claims. (Cl. 44—70)

1. A method for reducing piston ring wear in a compression-ignition engine which comprises the operation of said engine on a fuel consisting essentially of a residual fuel oil and small amounts of a compound selected from the group consisting of lithium naphthenate and potassium naphthenate, said amount being sufficient to reduce piston ring wear.

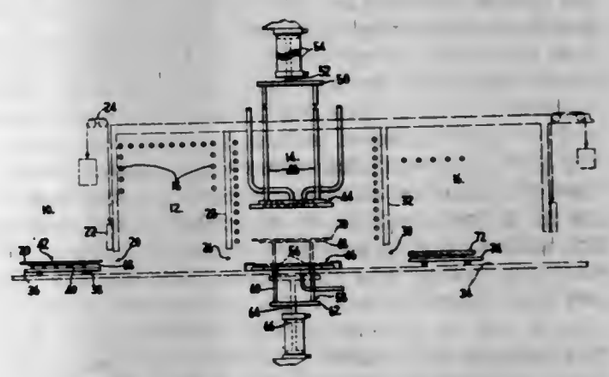


3,272,608
PRESSURE-ACTUATED VALVE FOR USE IN AIRCRAFT
John H. Andresen, Jr., Hewitt, N.J., assignor to Intercontinental Dynamics Corporation, Englewood, N.J., a corporation of New York
Filed Mar. 12, 1964, Ser. No. 351,380
5 Claims. (Cl. 98—1.5)

1. A safety valve for relief of air pressure in a confined locality responsive to variations in the difference between said pressure and the pressure at a locality external thereto, comprising, in combination, a housing defining a closed chamber; a flexible diaphragm peripherally secured to said housing to form one wall of said chamber, in such manner that the entire inner surface of said diaphragm is exposed to air pressure in said chamber, said diaphragm having a thickened central portion freely displaceable toward and away from said chamber in response to variations in pressure differential between air pressures acting on opposite surfaces of said diaphragm; means for admitting air from said confined locality to said chamber at a restricted rate; means for venting said chamber, to reduce the air pressure therein, responsive to increase in the difference between the pressure in said confined locality and the pressure in said external locality above a predetermined limit; manually controllable means for venting said chamber to said external locality; and means defining a valve port adapted to communicate with a first one of said localities and having a rim and further providing a rigid grill extending across said valve port, dis-

posed on the side of said diaphragm opposite to said chamber with said rim positioned, in fixed spaced relation to the periphery of said diaphragm, to be engaged by said thickened portion of said diaphragm for closure of said valve port when said diaphragm is displaced away from said chamber, and to define a passage for air flow between said rim and said diaphragm periphery, said grill providing support for said diaphragm when said diaphragm engages said rim; said passage being adapted to communicate with the second of said localities, such that separate regions of the outer surface of said diaphragm are individually exposed to air pressures in said first and second localities through said port and said passage respectively, whereby said diaphragm is displaced away from said rim when either of said last-mentioned pressures exceeds the pressure in said chamber and is displaced toward said rim whenever the pressure in said chamber exceeds the pressure in one of said localities and is not less than the pressure in the other of said localities.

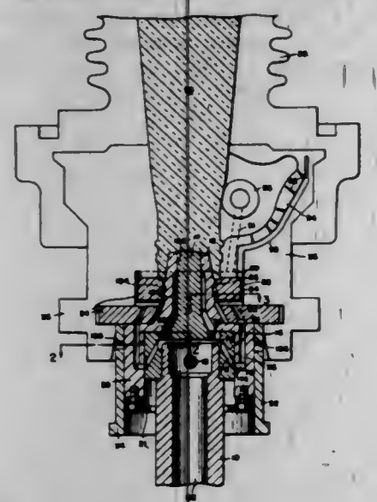
3,272,609
FEEDER FOR PRODUCING FIBERS
Kenneth R. Benton, Anderson, S.C., assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Filed Dec. 1, 1961, Ser. No. 156,378
3 Claims. (Cl. 65—1)



1. An insulated feeder for producing fibers from molten mineral material comprising a generally longitudinal metal chamber having a bottom wall with orifices therein, a refractory type insulating cement cast in situ in completely surrounding relation about the side and end walls of said chamber, compressible pads of high temperature fibrous insulating material interposed between the end walls of said metal chamber and said refractory insulation, said pads being sufficiently compressible that they compensate in compression for differences in thermal expansion between said metal chamber and said refractory insulation, said interposed pads being in direct contact with said feeder walls and being contacted directly by said refractory insulation.

3,272,610
METHOD OF MAKING HIGH STRENGTH DEVITRIFIED GLASS BODIES
Richard A. Eppler, Corning, and John F. MacDowell, Painted Post, N.Y., assignors to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Aug. 8, 1962, Ser. No. 215,609
2 Claims. (Cl. 65—33)

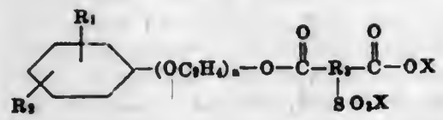
1. In the method for manufacturing a glass-ceramic body possessing a modulus of at least about 30,000 p.s.i. and a linear coefficient of thermal expansion of not more than about 70×10^{-7}° C., the improvement which consists in melting a glass-forming composition consisting essentially, by weight on the oxide basis, of 16–19.5% BaO, 7–10% MgO, 16.5–19% Al_2O_3, 46–49% SiO_2, and 6–12% TiO_2, the total of said BaO, MgO, Al_2O_3, SiO_2 and TiO_2 constituting at least 95% by weight of said glass, simultaneously cooling the melt below the transformation point of said melt and forming a glass shape therefrom, thereafter heating said glass shape to a temperature of at least about 1100° C., but not more than about 1175° C., for a time sufficient to obtain crystallization consisting essentially of hexacelsian and magnesium dititanate, and then cooling the crystallized shape to room temperature.



3,272,611
APPARATUS FOR MAKING MULTIPLE GLAZED UNITS
Arlo Jorgensen, Pittsburgh, Pa., assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Feb. 28, 1962, Ser. No. 176,249
4 Claims. (Cl. 65—152)

4. In apparatus for welding the marginal edges of a pair of vertically aligned, horizontally disposed, spaced glass sheets, including fixed means to support the lower sheet of said pair, movable means to support the upper sheet of said pair in spaced, superposed relationship to the lower sheet and welding means to electrically heat and fuse the marginal edges of the sheets together, the improvement which comprises a first vacuum chuck forming a part of said movable means; means to evacuate and release the vacuum of said first vacuum chuck; a second vacuum chuck constructed and arranged to be supported by said first vacuum chuck and to support, in a horizontal plane, the upper sheet of glass of said pair; and means, operable independently from said means to evacuate and release the

vacuum of said first vacuum chuck, to evacuate and release the vacuum of said second vacuum chuck; whereby said upper sheet may be alternately supported and released by said second vacuum chuck while said second vacuum chuck is supported by said first vacuum chuck.



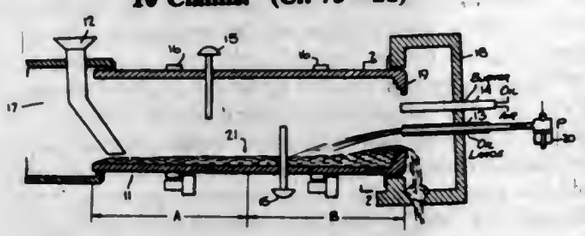
3,272,612
PARISON MOLD WITH FINISH PIN AND PLUNGER CONSTRUCTION FOR GLASSWARE FORMING MACHINES
Joseph R. Hamilton, Anderson, Ind., assignor to Lynch Corporation, Anderson, Ind., a corporation of Indiana
Filed June 3, 1963, Ser. No. 285,087
6 Claims. (Cl. 65—229)

1. In a finish pin and plunger construction for glassware forming machines, a parison mold, a neck ring therefor, a stop plate in said neck ring and having a bore, a hollow finish pin movable into and retractable from said bore and having an outer tubular piston, a finish pin cylinder in which said outer tubular piston is slidably carried, a finish pin plunger movable in said hollow finish pin and having an inner piston slidably carried in said outer tubular piston, actuating means connected with said finish pin plunger for retracting it from said hollow finish pin and moving said inner piston down in said outer piston by movement of said actuating means from up position to mid position, said inner piston having limited movement in said outer piston whereby further movement of said actuating means from mid position to down position moves said outer piston away from said stop plate, said actuating means when moving in an upward direction first effecting movement of said inner piston to its opposite limit of movement at said mid position whereby further movement to said up position moves said outer piston into engagement with said stop plate, and port means for evacuating the interior of said neck ring in said up position, cutting off the vacuum in said mid position, and admitting counter blow air past said finish pin plunger through said hollow finish pin into the parison and discharge of cooling air from within the parison past said hollow pin through said bore of said stop plate and from said finish pin cylinder in said down position.

3,272,613
WEED OIL-FERTILIZER COMPOSITION
Donald C. Young, Fullerton, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
No Drawing. Filed Sept. 4, 1962, Ser. No. 221,350
7 Claims. (Cl. 71—2.3)

1. A concentrate spontaneously emulsifiable in concentrated aqueous ammonium salt solutions to provide weed oil-fertilizer compositions comprising between about 49 and 94 weight percent of a hydrocarbon oil, between about 5 and 50 weight percent water and between about 0.5 and 19 weight percent of an emulsifier characterized by the following:

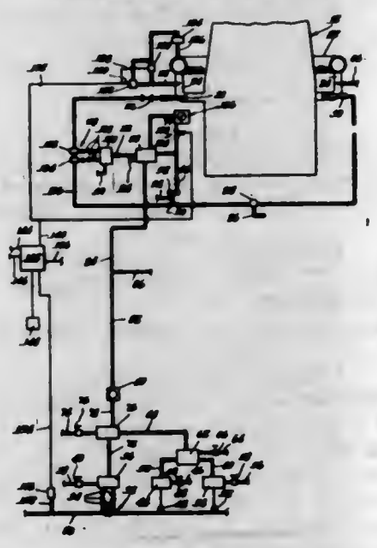
wherein:
R_1 is selected from the class consisting of alkyl and alkenyl groups;
R_2 is selected from the class consisting of hydrogen, alkyl and alkenyl groups;
R_3 is selected from the group consisting of trivalent sulfo-alkylene and sulfo-alkenylene;
X is an organic amine cation having from 1 to about 6 carbon atoms;
n is an integer between about 2 and about 5;
and the total of carbons in each of R_1, R_2, R_3 groups is less than about 12.



3,272,614
METHOD OF COMBATTING AQUATIC LIVING ORGANISMS
Robert J. Herschler and Wilbur L. Shilling, Camas, Wash., assignors to Crown Zellerbach Corporation, San Francisco, Calif., a corporation of Nevada
No Drawing. Filed July 2, 1963, Ser. No. 292,483
13 Claims. (Cl. 71—2.7)

1. A method of controlling aquatic living organisms selected from the group consisting of aquatic plants, mollusks, and crustaceans, which method comprises applying to at least one of said organisms an effective amount of a compound selected from the group consisting of hexachlorodimethyl sulfone and hexabromodimethyl sulfone, said effective amount being sufficient to control said aquatic living organisms but insufficient to control terrestrial plants.

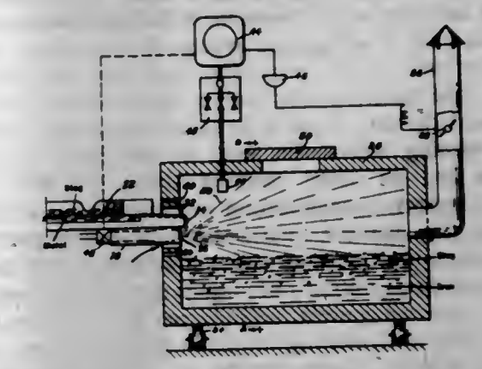
3,272,615
PRODUCTION OF SPHEROIDIZED PARTICLES
Daniel J. N. Hoffman and Thomas B. Beeton, Pretoria, Transvaal, Republic of South Africa, assignors to South African Iron and Steel Industrial Corporation Limited
Filed July 25, 1963, Ser. No. 297,635
Claims priority, application Republic of South Africa, Aug. 1, 1962, 62/3,266
2 Claims. (Cl. 75—.5)



1. In a method of spheroidizing irregularly shaped particles in which a gas containing free oxygen in at least the proportion contained in air is discharged through an inner passage of a flame-producing nozzle into contact with a combustible gas introduced through an annular passage in the nozzle surrounding the inner passage to thus produce a flame having an inner oxidizing zone and a reducing zone at least towards its perimeter; the irregularly shaped particles to be spheroidized being fed into the inner passage and axially therealong, the improvement comprising discharging the combustible gas tangentially into said annular passage along a helical path around said inner passage to entrain the particles issuing from the inner passage and cause said particles to undergo a swirling motion as they leave said passage to pass through the flame and its reducing zone thereby melting the particles at least at their surfaces; the oxygen-containing gas being discharged from the inner passage at an exit velocity substantially the same as the exit velocity of the combustible gas issuing from the surrounding annular passage; and cooling the particles as they pass from the flame.

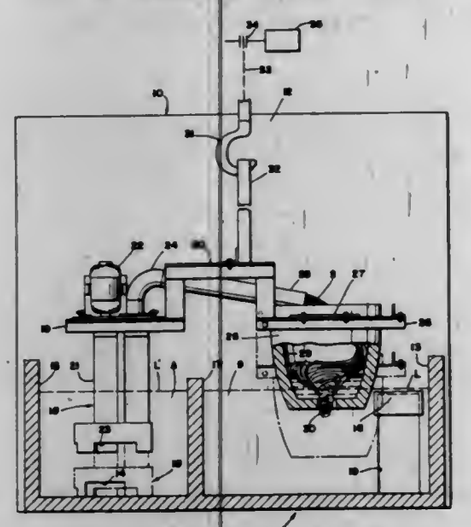
3,272,616
METHOD FOR RECOVERING NICKEL FROM OXIDE ORES
Paul E. Queneau, Fairfield, Conn., Philip E. Brubaker, Texas City, Tex., and Charles E. O'Neill, Upper Montclair, N.J., assignors to The International Nickel Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 25, 1964, Ser. No. 354,641
Claims priority, application Canada, Dec. 30, 1963, 892,353
10 Claims. (Cl. 75—21)

1. The process for recovering nickel from lateritic ores which comprises preheating said ore to a temperature of at least about 1500° F., introducing oil into a bed of said preheated ore while maintaining said bed in a state of tumbling movement so as to cause intimate admixture of oil with said bed, combusting said oil under controlled conditions to generate a strong reducing atmosphere within said bed and to heat said bed to a temperature below the incipient fusion temperature, reducing a substantial proportion of the nickel and at least about one part of iron for each part of nickel within said bed material, and melting the reduced ore to recover the nickel content contained therein.



3,272,617
SYSTEM FOR ADDING FLUID FUEL TO FURNACE BLAST
Anthony A. Fennell, % Fennell Corp., 379 E. 147th St., Harvey, Ill.
Filed Nov. 24, 1961, Ser. No. 154,551
7 Claims. (Cl. 75—42)

1. A control system comprising; a first sensing means disposed in sensible contact with a flow of reactable gas which is subject to fluctuations in its physical conditions, said first sensing means being arranged for developing a first signal indicative of the volumetric rate of flow of said reactable gas; a second sensing means disposed in sensible contact with said flow of reactable gas for developing a second signal indicative of the fluctuations of at least one of the physical conditions of said reactable gas; correction means connected to said first and second signal means for developing a third signal indicative of a corrected volumetric rate of flow of said reactable gas corrected for fluctuations of at least one of the physical conditions of said reactable gas; a plurality of nozzles receiving said flow of reactable gas and directing the same into a reaction mass; means directing a flow of fluid fuel to each of said nozzles; a plurality of means for regulating the flow of said fuel to said nozzles, one of said regulating means being operatively associated with each of said nozzles; and means individually associated with each of said regulating means for receiving said third signal and operating the associated regulating means in accordance therewith.



6. The method of controlling the introduction of fluid fuel into the air supply to a blast furnace comprising the steps of: causing a flow of air having a variable pressure and temperature; measuring the volumetric flow of air at a first point in its path to the blast furnace; introducing fluid fuel into said flow of air at a second point downstream from said first point; sensing the pressure and temperature of said flow of air adjacent said first point; altering said measure value of volumetric flow of air in proportion to the sensed changes in pressure and temperature; and regulating the volumetric flow of said fuel in accordance with the altered value of volumetric flow of air.

3,272,618
METHOD FOR MAKING STEEL
Jorge Miller, Carrera 10 No. 1964 Of. 911 y 912, Bogota, Colombia
Filed July 30, 1965, Ser. No. 477,362
1 Claim. (Cl. 75—60)

Method for conversion of molten metal in a furnace comprising:
(A) analyzing temperature and composition of said molten metal;
(B) forming a gaseous compound to conform to the stoichiometry of the desired conversion reaction;
(C) directing a trough-shaped jet of said gaseous compound into said furnace while forcing an auxiliary jet of said compound axially through said trough-shaped jet at the line of vacuum created by the opposed walls of said trough-shaped jet, said forcing of said auxiliary jet being at a pressure sufficient to shatter said molten metal into particles in the range of 10 to 1,000 microns in diameter;
(D) entraining ambient air into said furnace while directing and forcing said gaseous compound;
(E) pouring said molten metal into said trough-shaped jet being directed into said furnace so as to shatter said molten metal into particles and disperse said particles throughout said furnace;
(F) regulating said directing and forcing of said jets and said pouring of said molten metal so that equilibrium between gaseous and liquid reactions in said furnace is obtained;
(G) separately removing the resulting gaseous and liquid reaction products respectively from the top and bottom of said furnace; and
(H) analyzing said resulting gaseous reaction products and correspondingly regulating said forming of gaseous compound in accordance with the desired quality of liquid reaction product.

3,272,619
APPARATUS AND PROCESS FOR ADDING SOLIDS TO A LIQUID
Victor D. Sweeney, Euclid, and Walter U. Kaji, Chagrin Falls, Ohio, assignors to Metal Pumping Services, Inc., Cleveland, Ohio, a corporation of Ohio
Filed July 23, 1963, Ser. No. 297,076
16 Claims. (Cl. 75—65)

3. Apparatus for dissolving a solid in a liquid comprising an open-topped receptacle for maintaining a liquid bath, a wall dividing said receptacle into first and second portions, means providing fluid communication between said portions and below the level of the liquid contained therein, a pump in said first portion having an inlet opening below the level of the bath in the first portion and an outlet opening above the level of the bath, a hopper in said second portion having a relatively small outlet opening in a bottom of the hopper below the level of the liquid in said second portion to confine a predetermined amount of liquid in said hopper, said hopper having a relatively large top opening and a curved side wall sloping inwardly from said top opening to said hopper outlet opening, a conduit connected to the outlet opening of said pump and extending into said hopper so as to direct a stream of liquid tangentially against the side wall of said hopper to thereby create a vortex in the liquid confined in said hopper and in a portion of the bath below the outlet opening of the hopper, means for raising and lowering the hopper relative to the surface of the bath in said second portion and relative to said second portion to thereby alternately increase and decrease the amount of liquid confined in said hopper, to vary the intensity of the vortex, and to submerge solids introduced into said vortex at any desired rate.

3,272,620
OBTAINING URANIUM VALUES FROM BURNT LIGNITES
Adolph E. Meyer, Wheatridge, and Mayer B. Goren, Golden, Colo., assignors to Kerr-McGee Oil Industries, Inc., a corporation of Delaware
No Drawing. Filed Feb. 25, 1964, Ser. No. 347,652
17 Claims. (Cl. 75—84.1)

1. A process for burning mined carbonaceous fossil fuel containing desired metal values and having a substantial amount of fines present comprising agglomerating the fines to provide particles having a size of at least 1/32 inch, preparing a bed of the mined carbonaceous fossil fuel including the agglomerated fines, igniting the prepared bed of fuel, supplying an elemental oxygen-containing gas to the ignited fuel, and passing the resulting gases of combustion through the bed of fuel in the general direction of the advancing flame front, the quantity of elemental oxygen containing gas supplied to the ignited fuel being sufficient to support combustion and being controlled in quantity to provide a desired temperature of burning.

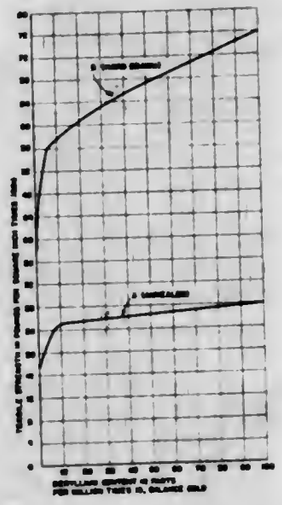
6. A process for recovering metal values from mined carbonaceous fossil fuels containing desired metal values and having a substantial amount of fines present comprising agglomerating the fines to provide particles having a size of at least 1/32 inch, preparing a contained bed of the carbonaceous fossil fuel including the agglomerated fines, igniting the bottom of the prepared bed of fuel, supplying air to the ignited fuel over a period of time sufficient to burn a desired quantity of the fuel and produce ash, the air being supplied to the bottom of the bed of fuel and forced upward under pressure whereby the flame front advances in a generally upward direction and the resulting gases of combustion are passed upward through the bed of fuel, the quantity of air supplied to the ignited fuel being sufficient to support combustion and being controlled in quantity to provide a desired temperature of burning, leaching the ash to produce a leach liquor containing desired metal values, and recovering the desired metal values from the leach liquor.

3,272,621
EXTRACTION OF METAL VALUES USING DENITRIFYING MICROORGANISMS
James E. Zajic, Oklahoma City, Okla., assignor to Kerr-McGee Oil Industries, Inc., a corporation of Delaware
No Drawing. Filed Feb. 10, 1964, Ser. No. 343,450
19 Claims. (Cl. 75—101)

1. A process for extracting copper values from a solid copper bearing material comprising cultivating denitrifying microorganisms in an aqueous nutrient medium therefor, the denitrifying microorganisms being tolerant to the aqueous nutrient medium and capable of reducing nitrate ion to ammonia, the aqueous nutrient medium containing a water soluble inorganic nitrate dissolved therein as a source of nitrate ion for the denitrifying microorganisms, and intimately contacting the solid copper bearing material with aqueous nutrient medium in which the denitrifying microorganisms have reduced nitrate ion to produce an aqueous medium containing dissolved copper values.

3,272,622
HIGH HEAT RESISTANT STEELS
Karl-Inge Bengtsson, Koping, Sweden, assignor to Aktiebolaget Bofors, Bofors, Sweden, a corporation of Sweden
No Drawing. Continuation of application Ser. No. 686,556, Sept. 27, 1957. This application Aug. 29, 1962, Ser. No. 220,160
Claims priority, application Sweden, Sept. 29, 1956, 8,890/56
1 Claim. (Cl. 75—126)

An alloy steel with a high heat resistance characterized by the feature that it consists essentially of: 0.28–0.32% carbon, 0.20–0.35% Si, 2.6–3.0% Cr, 2.6–3.0% Mo, 2.6–3.0% Co and 0.45–0.55% V, balance essentially iron.



3,272,623
INOCULATING ALLOYS CONSISTING OF Si-Al-Ca-Ba-Mn-Zr-Fe
Walter Crafts, Niagara Falls, N.Y., and Peter F. Wieser, Cleveland, Ohio, assignors to Union Carbide Corporation, a corporation of New York
No Drawing. Filed Oct. 28, 1963, Ser. No. 319,505
8 Claims. (Cl. 75—134)

1. An addition alloy for use in the manufacture of cast iron consisting essentially of about 35 to about 85% silicon, about 0.5 to about 1.5% aluminum, about 0.5 to about 4% calcium, about 0.5 to about 4% barium, about 2 to about 7% manganese, about 2 to about 7% zirconium, balance iron.

3,272,624
LITHIUM-ALUMINUM BASE FILLER ALLOY WITH OPTIONAL SILICON
Joseph F. Quass, Island Park, N.Y., assignor to Eutectic Welding Alloys Corporation, a corporation of New York
No Drawing. Filed May 23, 1963, Ser. No. 282,567
3 Claims. (Cl. 75—138)

1. An aluminum base filler alloy consisting essentially of from 0.005 to 0.010 percent by weight of lithium and the balance aluminum.

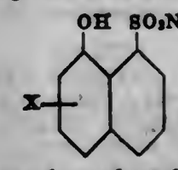
3,272,625
BERYLLIUM-GOLD ALLOY AND ARTICLE MADE THEREFROM
Bert Brenner, Tenafly, N.J., assignor to James Cohn, White Plains, N.Y., and Richard Cohn, Scarsdale, N.Y., jointly
Filed Oct. 18, 1965, Ser. No. 502,763
2 Claims. (Cl. 75—165)

1. A wire having a diameter less than 0.002 inch and made of an alloy consisting essentially of beryllium in the amount of about 0.001% to about 0.1% by weight and the balance gold, said wire having a tensile strength within the range of about 18,000 pounds per square inch to about 76,000 pounds per square inch.

3,272,626
XEROGRAPHIC METHOD
Charles E. Shinn, Simsbury, Conn., assignor, by mesne assignments, to Royal Typewriter Company, Inc., New York, N.Y., a corporation of Delaware
Filed Feb. 23, 1962, Ser. No. 175,204
1 Claim. (Cl. 96—1)

A method of xerography comprising the steps of superposing a radiation transparent charged xerographic plate with a non-transparent original to be reproduced with the indicia side of said original in optical contact with the unitary layer of photoconductive insulating material comprising said plate, said charged plate being characterized by a charge potential-radiation exposure curve wherein as the amount of radiation directed therethrough increases, the charge potential on said plate decreases exponentially,

directing visible radiation through said plate to said indicia side of said original whereby clear areas on said original will reflect said radiation and indicia bearing areas will absorb said radiation, said reflected radiation in passing back through said plate causing a greater discharge of said plate areas opposite clear areas on said original,



setting the radiation exposure to confine the resulting discharge to the slope region of said exposure curve which will produce a maximum difference between the charge levels on said plate corresponding to indicia bearing and clear areas,

and thereafter subjecting said plate to a bias field of the same polarity and equal in intensity to that of the field intensity of the plate areas corresponding to clear areas such that the resulting ability of plate areas corresponding to clear areas on said original to attract and retain charged powder is eliminated.

3,272,627
PHOTOTHERMOGRAPHIC DIAZO MATERIAL AND ITS METHOD OF USE FOR PHOTOCOPYING
Oskar Süs and Herbert Raubat, Wiesbaden-Biebrich, and Heinz Schäfer, Wiesbaden-Sonnenberg, Germany, assignors, by mesne assignments, to Kalle & Esser Company, Hoboken, N.J.
No Drawing. Filed Nov. 24, 1964, Ser. No. 413,610
Claims priority, application Germany, Nov. 26, 1963, K 51,457
15 Claims. (Cl. 96—49)

14. A method of making a photocopy of an original, which comprises the steps of:

exposing to actinic radiation through an original a photocopying material comprising a support coated with a photosensitive layer including photosensitive diazonium compound, dye-forming coupling component, and at least one 1-hydroxy-naphthalene-8-sulfonamide having the formula:

where R is a member selected from the group consisting of hydrogen and alkyl with one to four carbon atoms; X is a member selected from the group consisting of hydrogen, alkyl with one to four carbon atoms, and the group —SO_2NHR', where R' is a member selected from the group consisting of alkyl, cycloalkyl, arylalkyl, and aryl, said sulfonamides being heat-decomposable at temperatures above 80° C. to liberate a developing agent for said layer; and

heating said material to at least 80° C. to develop an image corresponding to the original on the photocopying material.

3,272,628
"LITH" DEVELOPERS CONTAINING WATER SOLUBLE BLOCK POLYMERS OF POLYOXYPROPYLENE AND POLYOXYETHYLENE
Lewis T. Connolly and Thomas C. Montrois, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Filed Dec. 17, 1963, Ser. No. 331,108
19 Claims. (Cl. 96—66)

12. The process for forming a high contrast image in an image exposed photographic lithographic element comprising the step of contacting said element with an aqueous developer solution comprising:

(1) an alkali;

(2) a p-dihydroxybenzene silver halide developing agent;

(3) an alkali metal sulfite; and

(4) a water-soluble block polymer of polyoxypropylene in which the polyoxypropylene chain has an average molecular weight between 800 and 2,100, and the polyoxyethylene units constitute from about 10 to about 60 percent by weight of said block polymer until a silver image is formed.

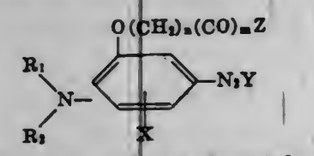
3,272,629

PHOTOSENSITIVE DIAZOTYPE MATERIALS

Henry C. Hills, Hollis, N.H., assignor to Nashua Corporation, Nashua, N.H., a corporation of Delaware

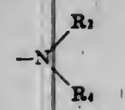
No Drawing. Filed Jan. 25, 1962, Ser. No. 168,813
1 Claim. (Cl. 96—75)

A photosensitive medium suitable for receiving inscriptions from a stylus or by the application of heat in a delimited portion of its area comprising a backing, an adherent obscuring film covering its surface which film consists of a normally substantially transparent thermoplastic resinous material and has a three dimensional cellular structure including a multiplicity of discrete microscopic or sub-microscopic enclosed voids beneath the outer surface thereof and distributed throughout the volume of the film in a major proportion of its thickness, the resinous film apart from said voids therein being substantially continuous and homogeneous, the film being normally opaque throughout its area because of its heterogeneous physical structure due to the inclusion of such voids, but adapted for local coalescense under the stylus or by the application of heat to permit release of air from said voids and collapse thereof with resultant production of a substantially homogeneous relatively transparent area disclosing the underlying surface, and a dry acid stabilized mixture of at least one photosensitive diazonium compound and a coupler compound reactive therewith to form an azo dye, said mixture being entirely contained within said voids, occupying a fraction of the volume thereof and distributed among said voids in amounts proportionate to the various volumes thereof.



3,272,630

LIGHT-SENSITIVE REPRODUCTION MATERIAL CONTAINING UNILATERALLY DIAZOTIZED p-PHENYLENE-DIAMINE DERIVATIVES AS THE LIGHT SENSITIVE SUBSTANCE



Herbert Rauhut and Oskar Siis, Wiesbaden-Biebrich, Germany, assignors, by mesne assignments, to Keuffel & Esser Company, Hoboken, N.J.

No Drawing. Filed Sept. 24, 1963, Ser. No. 311,220
Claims priority, application Germany, Sept. 26, 1962, K 47,829
31 Claims. (Cl. 96—75)

1. A light sensitive-diazotype reproduction material comprising a sheet-like support and a like-sensitive diazotype layer coated on said support, said layer comprising a light-sensitive diazonium compound of the following formula:

where R_1 and R_2 are members selected from the groups consisting of: group A wherein R_1 is an alkyl group containing up to 4 carbon atoms, and R_2 is a member selected from the group consisting of alkyl groups containing up to 4 carbon atoms and aralkyl groups with up to 10 carbon atoms; and group B wherein R_1 and R_2 are members of the same heterocyclic group; where Z is a member selected from the group consisting of alkoxy, arylated alkoxy, aryloxy and

wherein R_3 and R_4 are members selected from the groups consisting of: group C wherein R_3 and R_4 are alkyl radicals containing up to 4 carbon atoms and group D wherein R_3 and R_4 are members of the same heterocyclic group; X is a member selected from the group consisting of hydrogen, halogen and methyl; Y is the anion of an acid; n is an integer from 1 to 4; m is one of the integers 0 and 1; and where the sum of n and m is at least 2.

ERRATUM

For Class 96—90 see:
Patent No. 3,272,635

3,272,631

HAZE REDUCTION OF PHOTOGRAPHIC EMULSIONS CONTAINING A COVERING POWER AGENT

Alfred Gardner Garrett, Edison, and Raymond Joseph Le Strange, Middletown, N.J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Jan. 3, 1964, Ser. No. 335,690
10 Claims. (Cl. 96—107)

3. In a photographic emulsion containing gelatin, a silver halide and a covering power agent the improvement which comprises about 2 to 15 parts per 100 parts of gelatin of a compound selected from the group consisting of alkali metal sulfates and ammonium sulfate.

3,272,632

PROCESS FOR CONVERTING OFFAL AND FEATHERS

Paul Speer, 11048 Candlelight Lane, Dallas 29, Tex.

Filed Nov. 6, 1961, Ser. No. 150,569
15 Claims. (Cl. 99—2)

1. A process for converting poultry wastes consisting essentially of offal, blood and feathers into a nutritious product comprising the steps of contacting the waste with hot oil for a time and at a temperature above 300° F. sufficient to dehydrate, and cook the waste, the oil treatment step being conducted at atmospheric pressure, and at least partially removing the oil from the waste.

3,272,633

PREPARATION OF ACTIVE FERMENTATION BROTHS FROM STABLE INGREDIENTS

Forest H. Clickner, Chicago, Ill. (R.D. 3, Mendota, Ill.)

No Drawing. Continuation of application Ser. No. 76,447, Dec. 19, 1960. This application Apr. 28, 1964, Ser. No. 363,275
6 Claims. (Cl. 99—9)

1. The process for preparing a stable viable fermentation broth comprising the steps of preparing a first composition consisting of a major proportion of water mixed with at least one starch containing non-legume cereal and barley malt in an amount sufficient to convert during fermentation substantially all starch in said non-legume cereal to sugar, adding to said first composition after digesting said starch an effective amount of a non-pathogenic Aspergillus culture to form a second composition, fermenting said second composition until the rate of said fermentation retards, adding to the mass thus obtained an effective amount of *Bacillus subtilis* culture to form a third composition, fermenting said third composition until the rate of said fermentation retards, adding to the resulting mass thus obtained an effective amount of Lactobacillus culture to form a fourth composition, and fermenting said fourth composition until the rate of fermentation retards, thereby forming a viable fermentation broth.

4. A stable viable fermentation broth prepared according to the process of claim 1.

3,272,634

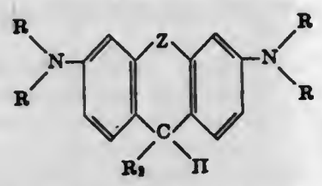
CONTINUOUS BREAD MAKING PROCESS WITH NORMALLY LIQUID SHORTENING

Paul M. Koren, Cincinnati, and Frank R. Schwain, Springfield Township, Hamilton County, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio

No Drawing. Filed Nov. 19, 1962, Ser. No. 238,727
7 Claims. (Cl. 99—90)

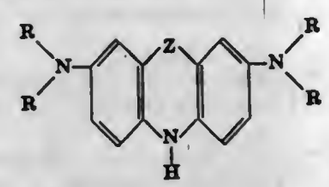
1. In a process for the continuous production of bread comprising the steps of mixing a fermented yeast brew, continuously mixing the brew in a first mixing stage with other dough ingredients including a shortening ingredient as hereinafter defined, passing the resulting mixture through the first mixing stage to produce a premixed dough having substantially uniform properties and thereafter subjecting the premixed dough to high speed mixing to develop a complete dough suitable for extruding and cutting into dough sections, panning, proofing, and baking, the improvement which comprises continuously introducing to the first mixing stage a normally liquid shortening ingredient at a temperature of about 60° F. to about 110° F., said shortening comprising a suspension in a liquid glyceride vehicle of from about 6.0 percent to about 14.0 percent by weight of shortening of substantially fully saturated fatty glyceride solids, having an iodine value not greater than 12, said solids consisting essentially of from about 0.8 percent to about 6.0 percent by weight of shortening of monoglycerides of fatty acids having from 16 to 22 carbon atoms, from 0.0 percent to about 6.0 percent by weight of shortening of diglycerides of fatty acids having from 16 to 22 carbon atoms, and from about 2.0 percent to about 8.0 percent by weight of shortening of triglycerides of fatty acids having from 16 to 22 carbon atoms, the amount of said shortening added at the first mixing stage being an amount not less than 2.8 percent based on the weight of the flour content in the dough.

3,272,635



COMPOSITIONS CONTAINING LEUCO XANTHENE DYES AND SUITABLE ACTIVATORS

Robert H. Sprague, Chagrin Falls, John A. Stewart, Parma, and James M. Lewis, Cleveland, Ohio, assignors to Horizons Incorporated, Cleveland, Ohio, a corporation of New Jersey

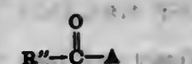


No Drawing. Filed Apr. 17, 1963, Ser. No. 273,569
7 Claims. (Cl. 96—90)

1. A composition which prints out a visible image directly as a result of exposure to visible light said composition comprising an intimate mixture consisting essentially of

(1) at least one leuco compound selected from the group consisting of leuco compounds represented by one of the following general formulas

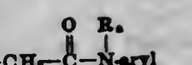
wherein each R is selected from the group consisting of H, lower alkyl and aryl and not all of the R's need be the same and wherein R_2 is selected from the group consisting of H, lower alkyl and aryl and Z is selected from O, S, Se and —NH:



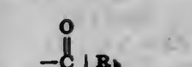
and wherein each R has the same meaning as indicated above and Z represents a member selected from the group consisting of O, S, Se and —NH; and

(2) at least one colorless non-toxic >C=O containing organic compound selected from the group consisting of

(a) carboxylic acids represented by the general formula R'COOH wherein R' is selected from the group consisting of aryl and alkaryl



(b) acyclic keto compounds represented by the general formula



wherein R'' is selected from the group consisting of aryl,

and

wherein R_a is selected from the group consisting of H, alkyl, aralkyl, aryl and

R_b being selected from the group consisting of H, alkyl, aralkyl and aryl; and A is selected from the group consisting of alkyl, alkaryl and aryl and

(c) cyclic keto compounds represented by the general formula

wherein Q represents the non-metallic atoms necessary to complete a heterocyclic ring with at least 5 and not more than 6 atoms in the ring and wherein the keto oxygen is attached to a ring carbon atom in said ring;

said compounds being present in the mixture in proportions ranging between 1:10 and 10:1 relative to each other, by weight.

3,272,636

METHOD OF CONTROLLING MICROORGANISMS IN FOOD PRODUCTS

Isaac N. Fehr and John Rust, Dallas, Tex., assignors to Campbell Taggart Associated Bakeries, Inc., Dallas, Tex., a corporation of Delaware

No Drawing. Filed Mar. 15, 1965, Ser. No. 440,016
7 Claims. (Cl. 99—214)

1. The method of controlling microorganisms in a food or beverage product comprising the steps of: packaging the product in a dielectric container; and exposing the packaged product to a field of alternating electromagnetic wave energy having a frequency of 20 to 40 megacycles at intensity of 500 to 3000 volts per centimeter for a sufficient length of time to attenuate the microorganisms in the product.

3,272,637

POLISH EMULSIONS OF SYMMETRICAL WAX ESTERS OF ACETYLENEDICARBOXYLIC ACID AND SATURATED ALCOHOLS

Leslie L. Sims, Baton Rouge, La., assignor to Ethyl Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Filed Nov. 23, 1964, Ser. No. 413,362
4 Claims. (Cl. 106—10)

1. A multicomponent wax emulsion polish consisting essentially of from about 2 to about 40 weight percent of a film-forming agent, from about 5 to about 90 weight percent water and an emulsifying agent, said film-forming agent being at least one selected from the group consisting of didotriacontanyl acetylene dicarboxylate and didocosanyl acetylene dicarboxylate.

3,272,638
METHOD FOR INCREASING THE SPINNING RATE OF CELLULOSE ORGANIC ACID ESTER FILAMENTS
George Patrick Touey and John Edward Kiefer, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Filed Feb. 4, 1964, Ser. No. 342,544
7 Claims. (Cl. 106—176)

1. In the method of dry spinning cellulose organic acid ester filaments, the step of increasing the spinning rate which consists in adding to the spinning solution prior to spinning, 10–40 percent based on the weight of the cellulose organic acid ester of a compound selected from the class consisting of non-crystallizing sucrose acetate isobutyrate, sucrose propionate isobutyrate and their mixtures.

3,272,639
TREATMENT OF PROTEINACEOUS MATERIALS WITH PEROXYDISULFATE SALTS
Donald H. Slocum, Wilmington, Del., assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
No Drawing. Filed Jan. 2, 1963, Ser. No. 248,896
8 Claims. (Cl. 106—125)

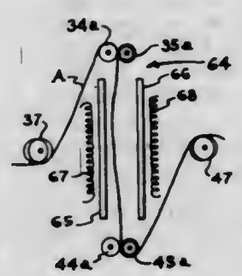
6. A method of producing an irreversible heat-set gel which comprises preparing an aqueous medium having a pH between about 2 and about 12 which contains (1) a colloidal dispersion of from about 3% to about 10% of a non-heat-gelable protein and (2) water-soluble peroxydisulfate salt in an amount of from about 0.07 to about 0.15 part for each part of said protein; and heating the protein- and salt-containing medium to a temperature in the range of from about 90° C. to about 100° C.

3,272,640
WATER INSOLUBILIZING AND INSENSITIZING PROCESS
Robert M. Geurden, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Dec. 22, 1960, Ser. No. 77,496
The portion of the term of the patent subsequent to Feb. 12, 1980, has been disclaimed
30 Claims. (Cl. 106—131)

1. Process of reducing the water solubility and water sensitivity of water-soluble materials which comprises preparing an aqueous mixture of said water-soluble material and an insolubilizing agent therefor, uniformly and stably distributing a hydrophobic film former throughout said mixture, substantially drying the resulting mixture at a temperature from room temperature to a temperature sufficiently low that neither the constituents of the mixture nor the resulting product being prepared begin to decompose, whereby the hydrophobic film former migrates to the surface of the resulting mixture, the insolubilizing agent substantially insolubilizes the water-soluble material, and the hydrophobic film former forms a substantially continuous water-insoluble water-impervious and water-insensitive film on the surface of said insolubilized water-soluble material, the amount of the insolubilizing agent and hydrophobic film former being about 1%–20% and 3%–25%, respectively, by weight of said water-soluble material being insolubilized, said insolubilizing agent being a material selected from the group consisting of unsaturated monobasic aliphatic acids, unsaturated dibasic aliphatic acids, the anhydrides of said acids, the water-soluble derivatives of said acids and anhydrides, polyamide-epichlorohydrin resins, aldehydes, and the water-soluble salts of polyvalent metals which complex with cellulose, said water-soluble materials being selected from the group consisting of water-soluble carboxyalkyl and hydroxyalkyl ethers and esters of cellulose and starch; starches; vegetable gums; casein, gelatin, animal glue and soy protein; polyvinyl alcohol, polyacrylic acid, substituted polyacrylic acid, copolymers derived from maleic anhydride; polyamides; and polymeric amines, said hydrophobic film former being selected from the group consisting of linseed oil, dehydrogenated castor oil, tung oil, soybean oil, poppyseed oil, hempseed oil, oiticica, fish oil, safflower oil, perilla, tall oil, sunflower oil, beeswax, hydrogenated spermaceti wax, Chinese wax, shellac wax, carnauba wax, ouricury wax, palm wax, candelilla wax, sugar cane wax, montan wax, ozocerite wax, paraffin wax, alkyd resins.

3,272,641
FROSTING COMPOSITION
Joseph R. Ehrlich, 1793 Riverside Drive, New York, 34, N.Y.
Filed Feb. 6, 1963, Ser. No. 256,756
6 Claims. (Cl. 106—238)

1. A sprayable liquid which, when sprayed on smooth surfaces, forms rapidly growing leaf-like and fan-like crystal patterns with long needles, said patterns being resistant to moisture in that they are self-reconstitutable but being removable by water, said liquid comprising:
(a) from about 2 to 84 parts by weight of water;
(b) at least 0.6 part by weight of water soluble volatile base selected from the group consisting of ammonia and an amine of sufficient volatility that when said liquid is sprayed on smooth sufaces said amine evaporates therefrom;
(c) from about 4 to 20 parts by weight of a water-insoluble resin, said resin containing free acid groups capable of reacting with said water-soluble volatile base to form a water-soluble salt of said resin, and said resin having a sufficiently high acid number to dissolve in water containing at least 0.6% by weight of ammonia; and
(d) from about 10 to 30 parts by weight of urea;
whereby said resin forms a water-soluble salt by reaction with said water-soluble volatile base.



3,272,642
COATING PROCESS AND COMPOSITIONS CONTAINING METAL ALCOHOLATES AND ALKYL ESTERS
Joseph F. Nelson, Westfield, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Filed June 30, 1958, Ser. No. 745,263
12 Claims. (Cl. 106—285)

1. A process of preparing a liquid coating composition which comprises mixing (A) at least one oily butadiene polymer characterized by an average molecular weight from about 700 to about 20,000 selected from the class consisting of (1) homopolymers of butadiene-1,3, (2) copolymers of butadiene-1,3 and styrene having at least 73% by weight of copolymerized units of butadiene-1,3

and (3) said homopolymers and said copolymers modified with an anhydride of an unsaturated dicarboxylic acid selected from the class consisting of maleic anhydride and citraconic anhydride in an amount up to 20% by weight of said polymers with (B) 1 to 15%, based on the weight of component (A), of a compound selected from the class of triamyl borate, trioctyl borate, tributyl phosphate, and aluminum isopropylate.

2. A coating composition consisting essentially of (A) at least one oily butadiene polymer characterized by a molecular weight from about 700 to about 20,000 selected from the class consisting of (1) homopolymers of butadiene-1,3 (2) copolymers of butadiene-1,3 and styrene, said homopolymers and said copolymers modified with an anhydride of an unsaturated carboxylic acid selected from the group consisting of maleic anhydride, fumaric anhydride, thioglycolic anhydride, thiosalicylic anhydride, mercaptophthalic anhydride, itaconic anhydride, mesaconic anhydride, citraconic anhydride, and acrylic anhydride, and (B) 1 to 15% by wt. of component (A) of a compound selected from the group consisting of triamyl borate, tri-octyl tributyl phosphate, and aluminum isopropylate.

3,272,643
PROCESS FOR MAKING COCKLED PAPER
George J. Pasek, Neenah, and Karl E. Seger, Appleton, Wis., assignors to Kimberly-Clark Corporation, Neenah, Wis., a corporation of Delaware
Filed Aug. 2, 1962, Ser. No. 214,237
4 Claims. (Cl. 117—11)

2. In a method for making cockled paper, the steps which comprise, applying a moist paper web in contact with a heated surface having a plurality of bosses of random spacing and size and of rounded, irregular and random shapes so as to partially dry the web, and subsequently completing the drying of the web while maintaining the web under a minimum tension.

3,272,644
DEVELOPMENT OF LATENT ELECTROSTATIC IMAGES WITH CRYSTALLINE TONERS
George R. Nelson, Holliston, Mass., assignor to Dennison Manufacturing Company, Framingham, Mass., a corporation of Nevada
No Drawing. Filed July 31, 1963, Ser. No. 299,084
6 Claims. (Cl. 117—17.5)

1. The method of developing a latent electrostatic image on a coating of photoconductive particles suspended in a thermoplastic resin on a support, said method comprising contacting said image with finely divided solid toner particles consisting essentially of dye dispersed in a water insoluble crystalline organic material non-reactive with said dye, said dye constituting from 10 to 60 percent by weight of said toner particles, said material having a melting range within about 1° C. between about 140° F. and the charring temperature of said resin and support, said material, when melted, being a solvent for substantially all of said dye and a solvating agent for said thermoplastic resin, said melted material having a steadily declining viscosity with the temperature and having at its lowest melt temperature a viscosity not exceeding about 40 centipoises, said material having its longest linear carbon chain not exceeding 15 carbon units and a molecular weight not in excess of about 350, and fusing the toner particles adhering to said image to cause the dye to be absorbed by said coating.

3,272,645
MOLDABLE LAMINATED SHEET MATERIALS AND METHOD OF MAKING SAME
Marcel Dubos, Bruay-en-Artois, Robert Fourcade, Gonnay, Claude Haberer, Houdain, and André Mennessier, Bethune, France, assignors to Houillères du Bassin du Nord et du Pas-de-Calais, Douai, France, a French public establishment
No Drawing. Filed Sept. 22, 1960, Ser. No. 57,641
Claims priority, application France, Sept. 29, 1959, 806,262; Nov. 7, 1959, 809,612
10 Claims. (Cl. 117—33)

1. A process for the production of laminated sheet materials in which a fibrous web is coated with an unsaturated cross-linkable polyester resin in the form of a stable, partially cross-linked gel, said process comprising dusting at least one face of the coated web with a finely divided solid organic powder.

3,272,646
IMPREGNATED POROUS PHOTOCHROMIC GLASS
John Andrew Chopoorian, Stamford, and Kay Oesterle Loeffler, Norwalk, Conn., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine
No Drawing. Filed Apr. 16, 1963, Ser. No. 273,306
6 Claims. (Cl. 117—33.3)

1. An article of manufacture comprising a porous glass substrate having a pore diameter ranging from about 15 A. to about 200 A., and having a solution of an aromatic diaminotetraacetic acid contained in said pores.

3,272,647
EPOXY TERMINATED POLYESTER COMPLEXES, COATING COMPOSITIONS CONTAINING SAME AND METAL SUBSTRATES COATED THEREWITH
Ralph G. Swanson and Aloysius N. Walus, Flint, Mich., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Mar. 23, 1962, Ser. No. 182,085
7 Claims. (Cl. 117—75)

1. The process of preparing an epoxy terminated polyester comprising:
(a) reacting one epoxy equivalent weight of a solid epoxy resin which is the reaction product of epichlorohydrin and bisphenol propane and two carboxyl equivalent weights of polymerized fatty acid to provide a carboxyl terminated prepolymer,
(b) reacting one carboxyl equivalent weight of said prepolymer with two epoxy equivalent weights of a liquid epoxy resin which is the reaction product of epichlorohydrin and bisphenol propane to provide an epoxy terminated polyester.

3. The process of claim 1 in which the polymerized fatty acid is a mixture of dimer and trimer fatty acids.

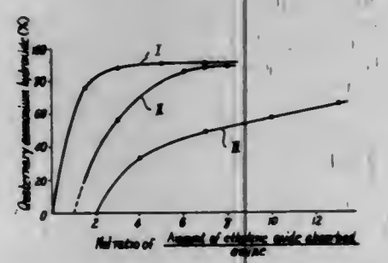
4. A product of the process of claim 3.

5. A coating composition comprising:
(a) an epoxy acrylic polymer derived from about 88–93% of a lower alkyl methacrylate, up to 10% of a lower alkyl acrylate, and 2–7% of a material selected from the class consisting of glycidyl methacrylate and glycidyl acrylate,
(b) an epoxy terminated polyester defined in claim 4, and
(c) a cross-linking agent for (a) and (b).

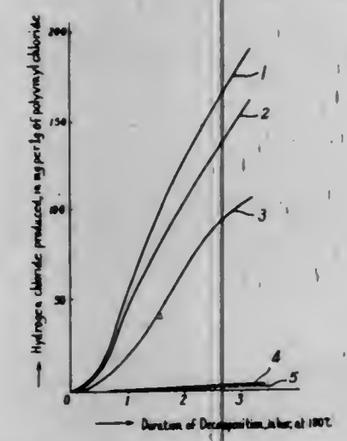
7. A metal substrate primed with the composition of claim 5 and surface coated with a composition containing as the essential film former a material selected from the class consisting of

(a) polymethyl methacrylate,

(b) mixture of soya oil modified glyceryl phthalate resin and butylated urea-formaldehyde resin, and



(c) nitrocellulose.



3,272,648

ANTISTATIC TREATMENT WITH A QUATERNARY AMMONIUM PERHALOGENATE AND PRODUCTS THEREOF

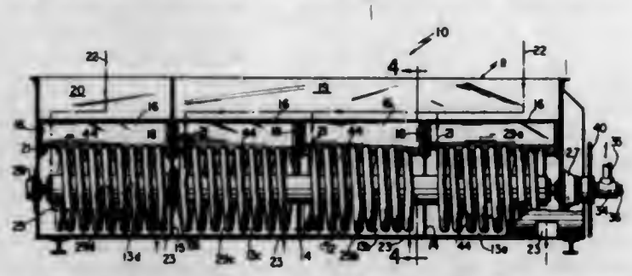
Takashi Yamamoto, Amagasaki, Japan, assignor to Nippon Oils and Fats Company Limited, Tokyo, Japan

Filed Oct. 4, 1965, Ser. No. 492,566
3 Claims. (Cl. 117—139.5)

1. A high molecular weight polymeric material normally having a tendency to accumulate a static charge of electricity thereon having associated therewith, at least on the outer surfaces thereof, as an anti-static agent about 0.2–15% by weight of a quaternary ammonium perhalogenate having the general formula:

$$[R_1-\underset{\displaystyle R_4}{\overset{\displaystyle R_2}{\overset{|}{\underset{|}{N}}}}-R_3]XO_4$$

in which X is a halogen; R_1 is a member selected from the group consisting of alkyl, alkyl carboxyamido and N-lower alkyl substituted alkyl carboxyamido radicals in which the alkyl has at least 6 carbon atoms; R_2 and R_4 are members selected from the group consisting of hydrogen and lower alkyl radicals; and R_3 is a lower hydroxyalkyl radical.



3,272,649

MINGLER FOR TEMPERATURE CONDITIONING SUGAR MASSES

Richard J. Huser, Mount Healthy, Ohio, assignor to The Western States Machine Company, Hamilton, Ohio, a corporation of Utah

Filed May 25, 1964, Ser. No. 369,705
8 Claims. (Cl. 127—17)

1. In an apparatus for conditioning massecuite or like material, an elongated material receiving tank, a hollow rotatable shaft extending longitudinally in said tank, a helical heat transferring-stirrer coil surrounding said shaft within the tank and being connected with the shaft for rotation of the coil with the shaft, so that the material in the tank tends to be moved in one longitudinal direction, and for a circulating flow of fluid through the coil by way of the shaft, said helical coil having turns spaced from said shaft so that heat transfer between the circulating fluid and material in said tank occurs at the surface

of said shaft and at the entire surface of said coil, and impeller blades extending radially from said shaft into the space between the latter and said turns of the coil, said blades being spaced apart angularly and axially on said shaft and inclined relative to the axis of said shaft in the direction opposed to the inclination of said turns of the coil to urge the material within said space in the other longitudinal direction and also radially outward toward the coil.

3,272,650

PROCESS FOR CLEANING CONDUITS

Russell L. MacVittie, Marietta, Ohio, assignor to Union Carbide Corporation, a corporation of New York

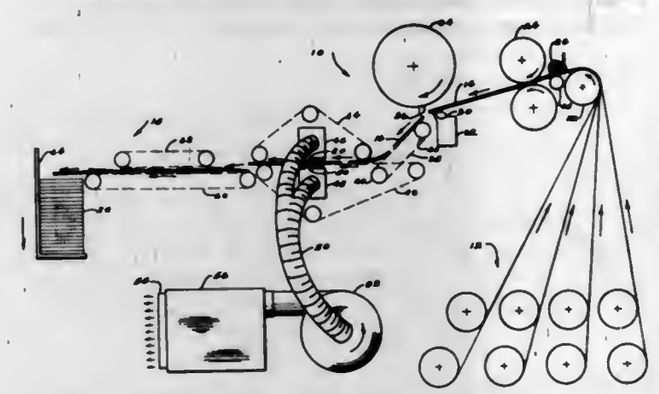
No Drawing. Filed Feb. 21, 1963, Ser. No. 260,285
5 Claims. (Cl. 134—7)

1. A process for cleaning adhering deposits from the interior surface of a conduit, said process comprising preparing a suspension consisting essentially of water and irregularly shaped particles having sharp corners at surface intersections, said particles being of an organic material chosen from the group consisting of styrene-acrylonitrile copolymers containing 10 to 30 percent acrylonitrile, methyl methacrylates, polycarbonates and nylons, the ratio of particles to water being in the range of 0.4 to 0.6 pound per gallon and said particles and said water being respectively inert to one another and mutually insoluble; said particles being further characterized by having a density of between 80 percent and 120 percent of said water, a hardness within the range of 60 to 120 Rockwell M and a size in the range of from 1/10 to 1/30 of the internal diameter of said conduit to be cleaned; and passing said suspension through the interior of said conduit to be cleaned at a lineal velocity sufficient to provide turbulent flow in said conduit, and for a time sufficient to remove said adherent deposits.

3,272,651

PAPER CUTTING DUST COLLECTOR SYSTEM AND METHOD

Harrison P. Quirk, Ypsilanti, Mich., assignor of ten percent to Peninsular Paper Company, Ypsilanti, Mich.



Filed Oct. 30, 1961, Ser. No. 148,505
4 Claims. (Cl. 134—21)

3. Method of removing cutter dust from sheets of paper being conveyed from a sheeting cutter to a layboy stacking system comprising the steps of:

horizontally conveying the cut sheets at a faster speed than that of the uncut web thereby forming gaps between successive cut sheets in the direction of their travel past a cleaning location;

exerting, by vacuum cleaning the full width of the top surface and full expanse of the cut ends of the sheets with a first suction action at said cleaning location, an upward force on the paper sheets as they are conveyed past said cleaning location;

exerting, by vacuum cleaning the full width of the bottom surface of the cut sheets with a second suction action at said cleaning location simultaneously with said first suction action, a downward force on said sheets of a magnitude which in combination with that due to gravity, acting also downwardly, on the sheets compensates for and substantially counter-

balances, with respect to vertical displacement of said sheets at said location, said upward force exerted on said sheets by said first suction action;

and removing cutter dust from the cut ends of the sheets, when the gap between successive sheets along said direction of travel is in said cleaning location, by means of the upward vacuum cleaning force whose magnitude is greater than the lower vacuum cleaning force in the area of the gap by the weight of an individual sheet due to gravity.

3,272,652

METHOD OF REMOVING FILM DEPOSITS

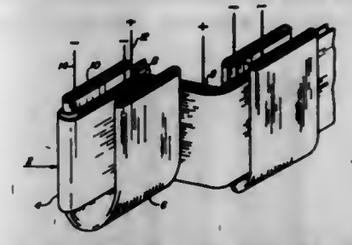
Donald C. Wood, Fredonia, Wis., assignor to Whirlpool Corporation, a corporation of Delaware

Original application Jan. 6, 1961, Ser. No. 81,083. Divided and this application Nov. 12, 1964, Ser. No. 412,281
4 Claims. (Cl. 134—34)

1. The method of removing film on tableware deposited thereon as a result of washing the tableware with phosphate or silicate containing detergents in hard water, comprising the steps of:

forcibly spraying the tableware with a solution of hard water and at least approximately 3% by weight sodium chloride to dissolve the deposited film; and

rinsing the tableware with water to remove said solution and dissolved film.



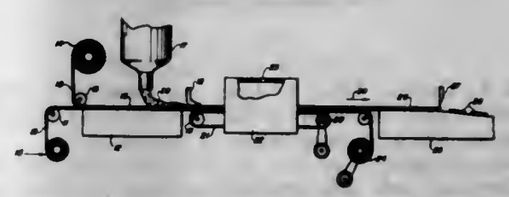
3,272,653

ELECTRODE ASSEMBLY

Frank Solomon, Lake Success, and Albert Himy, Elmhurst, N.Y., assignors to Yardney International Corp., New York, N.Y., a corporation of New York

Original application June 27, 1961, Ser. No. 119,867, now Patent No. 3,207,630, dated Sept. 21, 1965. Divided and this application Oct. 26, 1964, Ser. No. 426,457
3 Claims. (Cl. 136—6)

1. In an electro-chemical battery, an electrode assembly comprising a set of first electrodes of one polarity consisting predominantly of a first active material, a set of second electrodes of the opposite polarity interleaved with said first electrodes and consisting predominantly of a second active material, first separator means in the form of an accordion wrap having successive folds occupied by said first electrodes, and second separator means in contact with said first separator means, said second separator means being composed of several U-wraps embracing alternate ones of said folds and having arms individually occupied by said second electrodes, each of said separator means including at least one inner layer of semi-permeable sheet material and one outermost layer of



bibulous sheet material, one of said active materials being silver/silver oxide, the other of said active materials being selected from the group which consists of zinc/zinc oxide and cadmium/cadmium oxide.

3,272,654

METHOD OF PRODUCING AN ELECTRODE FOR AN ELECTROCHEMICAL SYSTEM

Maurice Lang, Massapequa, N.Y., assignor to Yardney International Corporation, New York, N.Y.

Filed July 17, 1963, Ser. No. 295,674
11 Claims. (Cl. 136—67)

1. A method of producing an electrode for an electrochemical system, comprising the steps of:

admixing a particulate substance thermally decomposable into an electrochemically active material with a liquid to produce a paste;

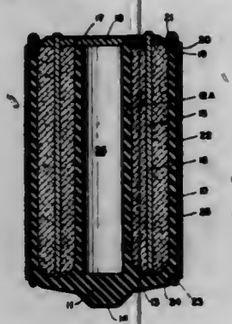
disposing a generally planar support grid upon a flat sheet of a refractory material incapable of absorbing said liquid from said paste and nonbonding to said active material at elevated temperatures;

depositing said paste within the interstices of said grid upon said sheet to produce a plate;

exposing said plate on said sheet to an elevated temperature sufficient to drive off at least a major part of said liquid and decompose said substance and sufficient to fuse said substance to said grid while forming a coherent mass of said substance within the interstices thereof;

and thereafter removing said plate from said sheet.

3,272,655



PRIMARY BATTERY

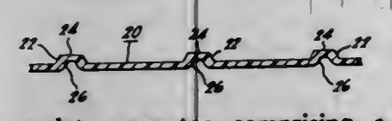
Rodolfo Rodriguez Balaguer, Harbor Beach, Fort Lauderdale, Fla., assignor to J. D. Hedges and Company Limited Partnership, Kingston, Jamaica, British West Indies, a partnership of Cuba

Filed Feb. 21, 1963, Ser. No. 260,270
15 Claims. (Cl. 136—100)

1. A dry cell battery, comprising a carbon cup having a hollow body, a closed end and an open end, a carbon rod projecting from said closed end and disposed generally along the longitudinal axis of said cup and being electrically connected thereto, said cup and said rod forming a cathode structure, a hollow annular metallic anode disposed between said rod and said cap and being substantially concentric therewith, said anode being formed from a metal which increases substantially in volume as a result of the chemical reaction occurring during the discharge of said battery, closure means for said open end of said cup,

battery mix contained in the space between said anode and said cup and said rod to react chemically with said anode when said anode and said cathode structure are electrically connected through an external circuit, said chemical reaction producing a substantially increase in the volume of material within said cell thereby producing a transverse stress tending to rupture said cup, and reinforcing means

surrounding said body of said cup and arranged to resist the rupturing force exerted on said body upon said increase in volume of said material within said cell, said carbon rod being hollow throughout at least a major portion of the height thereof whereby said transverse stress is substantially accommodated by a contraction in the cross sectional area of said rod.



3,272,656

BATTERY SEPARATOR

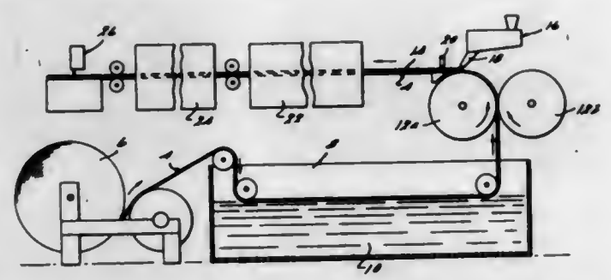
Ralph L. Corbin, Rine Kruger, and Donald V. Badgley, Muncie, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Original application Apr. 10, 1961, Ser. No. 102,044. Divided and this application May 4, 1964, Ser. No. 368,441

4 Claims. (Cl. 136—145)

1. A battery plate separator, comprising, a sintered, microporous sheet of compacted, high density polyethylene particles wherein each particle includes a core of alpha cellulose fiber therein, said sheet having a plurality of embossed ribs extending across the sheet wherein each rib has a transverse dimension and contour at one side of the separator different from its dimension and contour at the opposite side thereof for preventing nesting of stacked separators and wherein thickness of the separator is substantially uniform throughout the sheet and ribs, said separator having an apparent density of from 6.2 to 8.5 grams per cubic inch resulting in high tear and chip resistance and having an electrical resistance of less than .030 ohms per square inch taken at any section through said separator, said separator being slightly compressible.

3,272,657



METHOD OF MAKING A BATTERY SEPARATOR

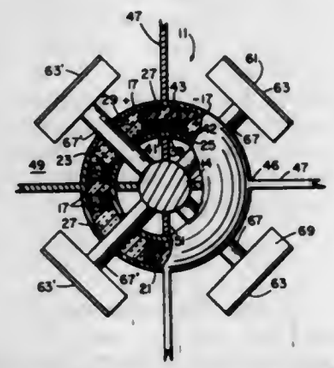
Piotr Zenczak, Corvallis, Oreg., assignor to Evans Products Company, Plymouth, Mich., a corporation of Delaware

Original application Nov. 14, 1960, Ser. No. 68,878. Divided and this application Jan. 13, 1965, Ser. No. 432,927

1 Claim. (Cl. 136—148)

The method of making a battery separator comprising the steps of providing a porous sheet of bibulous lignocellulosic paper, impregnating said sheet with an aqueous solution containing from about 1% to about 50% of an A-stage phenol aldehyde resin until said sheet contains from about 20% to about 50% by weight resin solids on a dry sheet basis, passing the wet impregnated said sheet between a pair of embossing rolls formed with mating circumferential rib and grooves disposed at longitudinally spaced intervals therealong and imparting a pattern to said sheet comprising a plurality of ribs and webs extending longitudinally of said sheet, immediately thereafter and without any appreciable reduction in the water content of the wet embossed said sheet applying a plastic bead on the crests of each of said ribs of the wet impregnated said sheet, said plastic bead comprising a substantially homogeneous blend of a polyvinyl chloride base

plastisol including a filler, and a thermosetting A-stage phenol aldehyde resin in a solvent and present in the proportions by weight of about 150 parts plastisol, from about 20 to about 50 parts phenol aldehyde resin on a solids basis, from about 75 to about 200 parts filler, and a quantity of solvent sufficient to form a substantially homogeneous blend; drying said sheet to remove the moisture therefrom without appreciably advancing the cure of the phenol aldehyde resins, and thereafter curing said resin and said plastic bead at a temperature ranging from about 450° F. to about 650° F.



3,272,658

RADIOISOTOPE HEATED THERMOELECTRIC GENERATOR POWER FLATTENING SYSTEM

Robert E. Rush, Livingston, N.J., assignor to the United States of America as represented by the United States Atomic Energy Commission

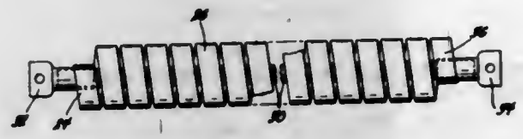
Filed Nov. 30, 1962, Ser. No. 241,447

6 Claims. (Cl. 136—201)

1. A secondary radiator for removing excess heat from a radioisotope heated thermoelectric generator having a radioisotope heat source and thermocouples for producing an electric current directly from the heat supplied by said heat source, comprising a plurality of oppositely disposed external secondary radiation segments having external radiating surfaces and heat conductors thermally connecting said radiating surfaces with said heat source to remove excess heat from said source, means for thermally shielding adjacent of said radiating surfaces from each other, spring means between said heat conductors and said heat source, means for holding said spring means equally under compression, and means for releasing opposite of said spring means with opposite of

said secondary radiating surfaces to throttle the rejection of heat by said secondary radiators so as to prevent unequal thrusts in the ejectment of said secondary radiator segments by said spring means.

6. The method of flattening the power output of a radioisotope powered thermoelectric generator, comprising the steps of externally rejecting excess heat from the radioisotope through removable radiators that are all operable at the beginning of the operating life-time of said generator, and throttling said rejection of excess heat by ejecting and separating said radiators sequentially at least as the mission time/radioisotope half life ratio increases to at least .62 whereby said generator has high end of mission efficiency.



3,272,659

TUBULAR THERMOELECTRIC ARRAY

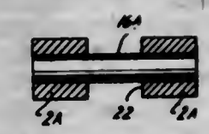
Arthur T. Bassett, Jr., Richard S. Gaugler, and Keith E. Jenkins, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corportion of Delaware

Filed Apr. 5, 1962, Ser. No. 185,302

2 Claims. (Cl. 136—203)

1. A thermoelectric array including a series of "P" type thermoelectric elements extending in spaced relation in a first row causing gaps between the elements as a result of the spaced relation of the elements, a series of "N" type thermoelectric elements extending in spaced relation in a second row which is substantially uniformly spaced from and substantially parallel to the first row of elements, means for connecting said "P" and "N" type elements alternately in series with each other comprising a first series of spaced metal connector elements located on and connecting one side of the "P" and "N" type elements and a second series of spaced metal connector elements located on and connecting the opposite side of the "P" and "N" type elements, at least two of said series of elements being skewed, said series of elements being constructed and arranged to define a substantially hollow tubular configuration, a rod of electrical insulating material extending from end to end within the interior of said hollow tubular configuration of elements, the ends of said rod being provided with first and second electrical terminal means, means for electrically connecting the first electrical terminal means adjacent the first end of said array to the adjacent P-type thermoelectric element at the first end of said array, and means for electrically connecting the second electrical terminal means at the second end of said array to an adjacent N-type thermoelectric element.

3,272,660



THERMOELECTRIC UNIT WITH ATTACHED TERMINALS

Josef Intrater, New York, N.Y., and Lawrence R. Hill, Short Hills, N.J., said Intrater assignor to Electronics & Alloys, Inc., Ridgefield, N.J., and said Hill assignor to General Instrument Corporation, Newark, N.J., both corporations of New Jersey

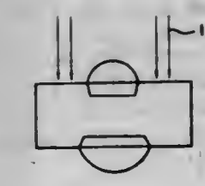
Original application Sept. 13, 1962, Ser. No. 223,871, now Patent No. 3,197,845, dated Aug. 3, 1965. Divided and this application Feb. 14, 1964, Ser. No. 345,034

12 Claims. (Cl. 136—205)

1. In combination, a core comprising an intermetallic compound in the form of closely packed and longitudinally elongated needle-like grains, and sheaths of physically workable, electrically conductive material which will not degrade said intermetallic compound, said sheaths respectively surrounding, being pressed closely against, and diffusion bonded to longitudinally spaced portions of said

core, the portion of said core between said sheaths being free of said sheath material.

3,272,661



MANUFACTURING METHOD OF A SEMI-CONDUCTOR DEVICE BY CONTROLLING THE RECOMBINATION VELOCITY

Masami Tomono, Hiroshi Kodera, and Hiroshi Ueda, Tokyo, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan

Filed July 16, 1963, Ser. No. 295,490

Claims priority, application Japan, July 23, 1962, 37/30,250

1 Claim. (Cl. 148—1.5)

A manufacturing method of semi-conductor devices, wherein the recombination velocity in the vicinity of a semi-conductor surface comprises the steps of

irradiating a semi-conductor specimen, in which the major part is already completed, with a focused electron beam at the position which can affect the recombination velocity, and

monitoring a predetermined characteristic of said semi-conductor specimen which depends on the recombination velocity of minority carriers in the semi-conductor body, so as to obtain a semi-conductor device of controlled characteristics.

3,272,662

PROCESS FOR AFTER-TREATING METAL SURFACES COATED WITH CRYSTALLINE ANTI-CORROSION LAYERS

Willy Herbst, Hofheim, Taunus, and Heinz Ludwig, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Jan. 23, 1962, Ser. No. 168,261

Claims priority, application Germany, Feb. 8, 1961, F 33,161

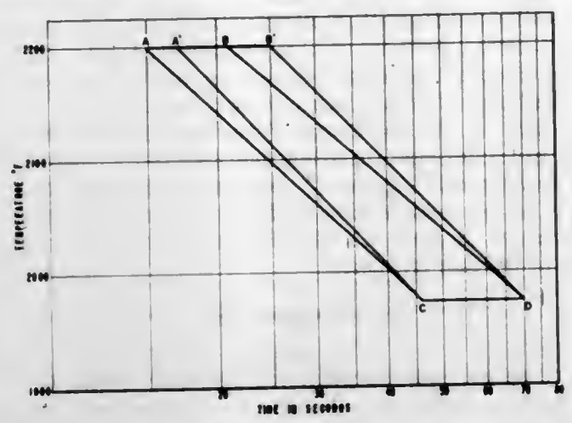
3 Claims. (Cl. 148—6.15)

1. A process for the after-treatment of phosphatized ferrous surfaces in order to improve the corrosion protection, which comprises treating said coated metal surfaces with an aqueous solution containing about 10^{-5} mol per liter solution to about 10^{-1} mol per liter solution of a saturated aliphatic phosphonic acid containing more than 5 carbon atoms, and subsequently drying said metal surfaces.

3,272,663
WASH-PRIMER COATING INCLUDING MOLYBDATE RADICAL
Max Kronstein, New York, N.Y., assignor to Oakite Products Inc., New York, N.Y., a corporation of New York
No Drawing. Filed Nov. 13, 1962, Ser. No. 237,282
21 Claims. (Cl. 148—6.16)

21. A metal product consisting essentially of a basis metal with at least part of its surface coated with an adherent integral complex surface coating composed of an inorganic and an organic portion, the inorganic portion of which consists essentially of the principal metal constituent of the basis metal of the product, and the elements phosphorus, zinc and molybdenum, each of the latter three being present in the surface coating in its individually respective ratio to the principal metal of the basis metal greater than the respective ratio of any phosphorus, zinc and molybdenum originally present in the basis metal to the principal metal of the basis metal; and said organic portion is a dry, continuous film of a film-forming reactive resin member of the class consisting of polyvinyl formal, polyvinyl acetal, and polyvinyl butyral.

3,272,664
COMPOSITION AND METHOD FOR COATING METAL SURFACES
Louis Schlossberg, Oak Park, Earl Eugene Logue, Birmingham, and Paul J. Carrier, Detroit, Mich., assignors to Detrex Chemical Industries, Inc., Detroit, Mich., a corporation of Michigan
No Drawing. Filed July 25, 1963, Ser. No. 297,694
6 Claims. (Cl. 148—6.17)



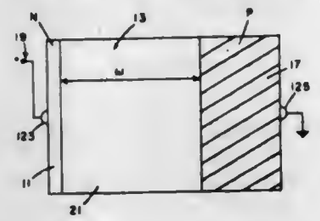
1. A solution for producing phosphate coatings on ferrous metal surfaces consisting essentially of water, an alkali metal acid phosphate, an alkali metal chlorate and an alkali metal dinitrobenzene sulfonate synergistically cooperative with said chlorate.

3,272,665
MOLYBDATE COATINGS ON ALUMINUM AND ALUMINUM BASE ALLOYS
Harmon Brown Romans, Henrico County, Va., assignor to Reynolds Metals Company, Richmond, Va., a corporation of Virginia
No Drawing. Filed Apr. 24, 1963, Ser. No. 275,225
13 Claims. (Cl. 148—6.27)

1. Method for protecting the surface of aluminum and aluminum base alloys against corrosion which comprises immersing said surface in an aqueous solution consisting essentially of water and at least about 4% by weight of an alkali metal molybdate at a temperature between about 325° and about 400° F. for a period of at least 2 hours under pressure sufficient to maintain the solution and the metal surface at said temperature.

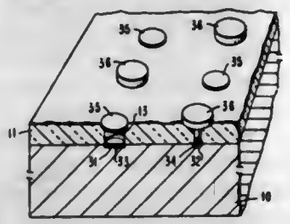
3,272,666
METHOD OF HEAT TREATING NICKEL BASE ALLOY ARTICLES UP TO 20 MILS IN THICKNESS
John Symonds, Annapolis, Md., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Dec. 9, 1963, Ser. No. 329,128
3 Claims. (Cl. 148—13)

1. A method of heat treating a nickel base alloy object of up to 20 mils in thickness containing as essential elements, by weight percent, from 0.04 to 0.15 carbon, 5 to 25 chomium and from 1 to 10 of at least one element selected from the group consisting of aluminum and titanium, which comprises heating said nickel base alloy object to a maximum temperature of from 1975° F. to 2200° F., retaining said nickel base alloy object at said maximum temperature for a period of time such that when the retaining time is plotted against said maximum temperature, the resultant point falls within the area ABDC as set forth in the accompanying drawing, and maintaining the heating of said nickel base alloy object such that when the retaining time plus the heating time



from 1975° F. to the maximum temperature is plotted against said maximum temperature, the resultant point falls within the area A'B'DC as set forth in the accompanying drawing.

3,272,667
SUBMERGED ARC WELDING PROCESS AND FLUX COMPOSITION UTILIZING FLUOROCARBON
John C. Siegle, Hilton, Wilmington, and John Teti, Sr., West Minster, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Dec. 10, 1964, Ser. No. 417,467
6 Claims. (Cl. 148—23)

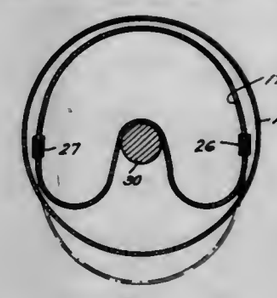


1. In the process of welding metals by the submerged arc technique, the improvement which comprises employing as a welding medium (1) a granular flux material comprising a member of the group consisting of the oxides of calcium, potassium, sodium, silicon, aluminum, titanium, magnesium, and manganese, and mixtures of said oxides, and (2) a solid fluorocarbon polymer or telomer in finely divided particulate form, the fluorocarbon being selected from the group consisting of polytetrafluoroethylene, polychlorotrifluoroethylene, polyvinylidene fluoride, polyhexafluoropropylene, and the copolymers of vinylidene fluoride and tetrafluoroethylene with hexafluoropropylene, and mixtures of said fluorocarbons.

3,272,668
SEMICONDUCTOR DETECTOR METHOD
Gabriel L. Miller, Babylon, and Sanford E. Wagner, Brookhaven, N.Y., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed Apr. 11, 1963, Ser. No. 272,497
3 Claims. (Cl. 148—177)

1. A method for producing a semiconductor radiation detector, comprising alloying lithium into p-type silicon, reverse biasing the alloyed structure with a constant wattage supply, and simultaneously removing Joule heat generated in said detector by said reverse biasing with a vapour phase coolant in which said semiconductor is immersed.

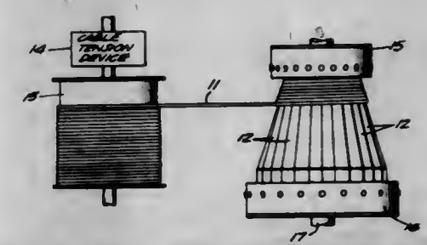
3,272,669
METHOD OF SIMULTANEOUSLY FABRICATING A PLURALITY OF SEMICONDUCTOR P-N JUNCTION DEVICES
Samuel S. Im, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 19, 1963, Ser. No. 302,991
15 Claims. (Cl. 148—179)



1. The method of simultaneously fabricating a plurality of semiconductor PN junction devices comprising:
establishing on selected portions of a surface of a semiconductor body of one conductivity type a plurality of adherent thin metal film members;
introducing said body and said members into a bath of a molten material which has a temperature less than the melting point of said body and comprises (a) a conductivity-directing impurity that is of a type opposite to that of said body and has an affinity for the metal of said members and (b) a quantity of said metal which substantially saturates said bath, whereby particles of said material adhere to said members;
removing said body, members and particles from said bath and cooling the assembly so that said particles are bonded to said members; and
heating said assembly to the alloying temperature of the materials thereof and thereafter cooling said assembly to form on said body a plurality of PN junctions and recrystallized semiconductor regions of the opposite conductivity type.

3,272,670
TWO-STABLE, HIGH-RESOLUTION ELECTRON-ACTUATED RESISTS
Robert E. Myers, Menlo Park, Calif., assignor to Stanford Research Institute, Menlo Park, Calif., a corporation of California
No Drawing. Filed Aug. 27, 1965, Ser. No. 483,326
5 Claims. (Cl. 156—13)

1. The method of producing a microscopic pattern on a thin metal or metal oxide film comprising depositing on said film a covering film of one of the materials selected from the group consisting of tetrakistriphenylsiloxytitanium and tetrakistriphenylsiloxysilane, bombarding predetermined regions of said covering film with electrons having an energy sufficient to alter the structure of the covering film wherever they impinge to a glassy etch resistant surface, removing those portions of the covering film which have not been bombarded heating the portions of said covering film which are not removed over a predetermined interval at a predetermined temperature and thereafter etching the exposed thin film.

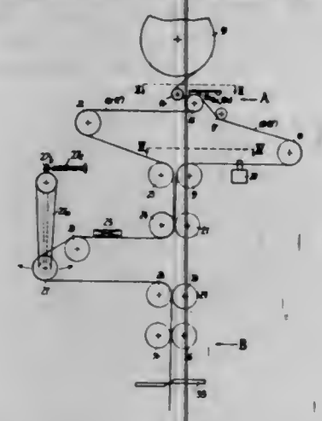


3,272,671
METHOD OF MAKING A COMPOSITE FIBER AND METAL TUBULAR CONTAINER BODY
Paul C. Gaylord, Staten Island, and Herbert L. Carpenter, Jr., Babylon, N.Y., assignors to The Greif Bros. Cooperage Corporation, Delaware, Ohio, a corporation of Delaware
Filed Aug. 28, 1963, Ser. No. 305,111
6 Claims. (Cl. 156—86)

1. The method of making a composite fiber and metal tubular container body which comprises: providing a first tubular shell made of wound layers of fiber adhesively laminated together; providing a second tubular shell with an outside diameter no greater than and approximating the inside diameter of the first shell and made of sheet metal of sufficient resilience so that the shell may be diametrically compressed and will thereafter resume is normal shape; applying compressive force to the second shell across intersecting transverse axes so that all outside diameters of the second shell are reducd to a dimension

less than the corresponding inside diameters of the first shell; then while maintaining the second shell in such transversely compressed condition, telescopically assembling the two shells with the second shell being disposed inside the first shell; and thereafter releasing the compressive forces applied across the second shell so that it expands into engagement with the inside surface of the first shell to thereby provide a composite fiber and metal container body.

3,272,672
METHOD AND APPARATUS FOR PRESSURE LAMINATING TAPE WOUND ARTICLES
James A. Lampman, Inglewood, Glenn E. Young, Carmel, and Ethridge E. Hardesty, Pine Valley, Calif., assignors to Swedlow, Inc., a corporation of California
Filed June 22, 1962, Ser. No. 204,510
7 Claims. (Cl. 156—189)



1. A process for pressure laminating comprising spirally winding a pressure curable tape around a mandrel, surrounding said tape with a flexible sleeve, surrounding said sleeve with caul plates, spirally winding at least one layer of cable around said caul plates, and exerting tension on said cable.

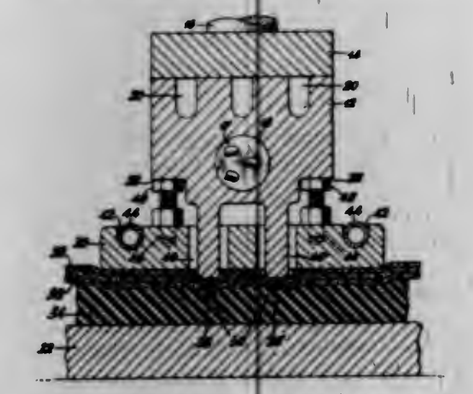
2. The process of claim 1 wherein said tape is subjected to heat while said cable is under tension.

3,272,673
METHOD OF AND DEVICE FOR PROVIDING WRAPPING MATERIAL WITH A PULL STRIP
Heinz-Hermann Focke, Bremen-Hemelingen, Germany, assignor to Focke & Pfuhl, Bremen-Hemelingen, Germany
Filed May 14, 1963, Ser. No. 280,359
3 Claims. (Cl. 156—260)

1. A method of continuously and simultaneously providing two similar, composite webs of wrapping material, each of which comprises a relatively wide strip and a relatively narrow tear strip superimposed on said relatively wide strip, which includes the steps of: feeding a web of material longitudinally, simultaneously cutting said web along the center line and along two lines parallel

to said center line and equally spaced on opposite sides of said center line and substantially closer to said center line than to the outer edges of said web so as to form two narrow tear strips of equal width along the sides of the center line and two substantially wider wrappings strips between said narrow strips and said outer edges,

and guiding each relatively narrow strip into superimposed relationship with one of the relatively wide strips.



2. A method as claimed in claim 1, and applying an adhesive to the side of each of said narrow strips that engages the corresponding wide strip before said strips are superimposed.

3,272,674

PLASTIC FILM WELDING PROCESS AND APPARATUS

John P. Sachs, La Grange, Howard E. Kasting, Park Forest, and Alvin E. Ericson, Chicago, Ill., assignors to Union Carbide Corporation, a corporation of New York

Filed May 28, 1962, Ser. No. 198,014
5 Claims. (Cl. 156—282)

1. Method of pressure welding thermoplastic films which comprises compressing the overlapping film material between a backup surface, and a platen in an area closely and completely surrounding the weld to be made, thereby flattening such material in such area, then softening with heat and under pressure such material while it is so compressed, by advancing the hot sealing surface of a heat-sealing bar into contact with such material within such area after compressing the overlapping film, with heat and pressure sufficient only to weld the material together, while controlling the degree of compression of such material between said platen and backup surface by variably limiting the advancing of said heat sealing surface toward said backup surface, simultaneously cooling such platen during such welding operation, and finally, first retracting said sealing surface from the weld and then releasing the so-welded material from such compression by withdrawing said platen to avoid springback and bulging of the film plies.

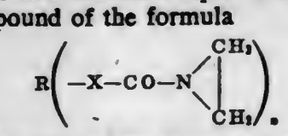
3,272,675

WATER-RESISTANT ADHESIVES

Hideo Suzumura and Hisao Miyahara, Kurashiki, Japan, assignors to Kurashiki Rayon Co., Ltd., Kurashiki-shi, Japan, a corporation of Japan

No Drawing. Filed June 23, 1961, Ser. No. 119,058
Claims priority, application Japan, July 2, 1960, 35/29,879
2 Claims. (Cl. 156—292)

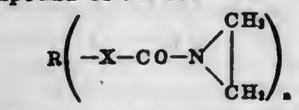
2. In the manufacture of corrugated cardboard resistant to exfoliation even during prolonged immersion, the improvement which comprises adhesively securing the components of the cardboard to each other by means of a water-resistant adhesive comprising an intimate admixture in water of a three component system consisting essentially of polyvinyl alcohol, a highly siliceous pigment, and an alkali metal silicate, said pigment and filler being present in an amount by weight which is about twice the amount by weight of polyvinyl alcohol, and said silicate being present in an amount by weight which is about one-fifth that of the polyvinyl alcohol.



3,272,676

METHOD OF EFFECTING THE ADHESION OF POLYESTER MATERIALS TO RUBBERS

Koji Kigane and Shinichi Yamada, Iwakuni-shi, Yamaguchi-ken, and Yukinori Isozaki, Obtake-shi, Hiroshima-ken, Japan, assignors to Teikoku Jinzo Kenshi Kabushiki Kaisha, Osaka, Japan, a corporation of Japan



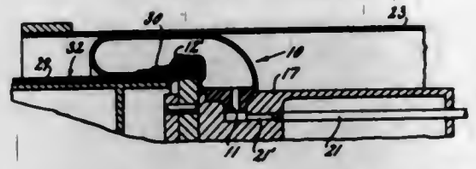
No Drawing. Filed Sept. 11, 1962, Ser. No. 222,968
Claims priority, application Japan, Sept. 14, 1961, 36/33,532; Sept. 14, 1961, 36/33,533; Sept. 19, 1961, 36/33,952; Sept. 19, 1961, 36/33,953
14 claims. (Cl. 156—315)

1. A method for the adhesion of a polyester material to a rubber compound which comprises treating said material with a first treatment liquor containing an ethyleneimino compound of the formula

wherein X is NH or 0; R is a polyvalent organic radical free from active hydrogen; and n is an integer of at least 2 and with a second treatment liquor containing an ethylenically unsaturated monomeric amide compound, followed by a heat treatment at a temperature of 100–250° C., and thereafter effecting the adhesion of the material to the rubber compound.

8. A method for the adhesion of a polyester material to a rubber compound which comprises treating said material with a first treatment liquor containing an ethyleneimino compound of the formula

wherein X is NH or 0; R is a polyvalent organic radical free from active hydrogen, and n is an integer of at least 2, and with a second treatment liquor containing an ethylenically unsaturated epoxy compound, followed by a heat treatment at a temperature of 100–250° C., and thereafter effecting the adhesion of the material to the rubber compound.



3,272,677

INFLATABLE ANNULAR BLADDER USED TO FORM THE BEAD REGION OF A PNEUMATIC TIRE CARCASS

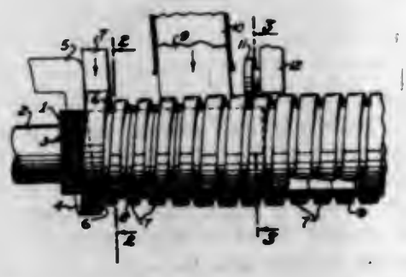
Sheppard A. Black, Wayne, N.J., assignor to United States Rubber Company, New York, N.Y., a corporation of New Jersey

Filed Dec. 4, 1962, Ser. No. 242,288
8 Claims. (Cl. 156—401)

1. An inflatable annular bladder for use in an apparatus for forming a bead region of a tire carcass from a ply band having the radially interior surface of a bead in contact with the outer surface of said band, the end of said band extending beyond said bead, said apparatus including a bladder support member having a generally cylindrical outer surface on which said bladder is adapted to be operationally mounted and a cage member having a generally cylindrical inner surface surrounding said support member and radially spaced therefrom to form an annular aperture to receive said extending ply band end exterior of said bladder when said bladder is uninflated, said cage member being axially displaceable

with respect to said support member, said bladder comprising:

(a) an air impervious extensible wall portion forming the axial face of said bladder for disposition axially adjacent said bead, said wall portion also forming a relatively narrow annular portion of the radially outermost wall of said bladder contiguous to said face; and



(b) a reinforced air impervious wall portion adjacent to said extensible wall portion and forming the remainder of the bladder wall, said reinforced wall portion being substantially inextensible in a plane including the axis of the bladder.

3,272,678

APPARATUS FOR THE MANUFACTURE OF HOSE BY HELICALLY WINDING AN ELONGATED STRIP OF PLASTIC MATERIAL

Alfred H. Swan, Newport Beach, Calif., assignor, by mesne assignments, to Air Reduction Company, Incorporated, a corporation of New York

Filed Feb. 15, 1962, Ser. No. 173,399
2 Claims. (Cl. 156—429)

1. A hose-making machine, comprising:

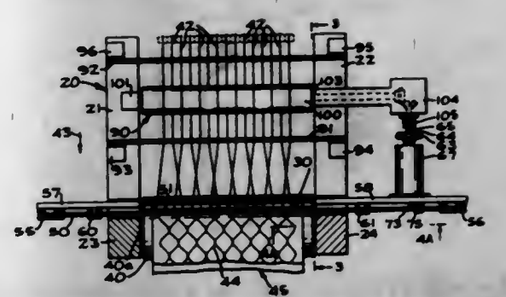
(a) a drive shaft;

(b) a mandrel extending coaxially from said shaft;

(c) means for directing a first hose element tangentially onto said mandrel to wrap thereabout as said mandrel is rotated;

(d) a fixed guide encircling said mandrel at its end adjacent said shaft, the inner periphery of the guide being contiguous to but clearing said mandrel, and its axial end directed toward the extended end of the mandrel forming a helical guide face;

(e) said guide face having a helical pitch corresponding to the width of said first hose element to force said first hose element helically onto said mandrel with its convolutions in mutual contact, thereby to crowd said first hose element axially along said mandrel;



(f) and means for entraining a second hose element on said first hose element for helical travel therewith.

3,272,679

APPARATUS FOR FORMING REINFORCED SHEET MATERIAL

Friedrich Hebberling, 527A Tyrella, Mountain View, Calif.

Filed July 5, 1963, Ser. No. 292,980
14 Claims. (Cl. 156—440)

1. A reciprocating apparatus for imparting a cyclic motion to strands of filamentary material comprising an endless tape with a plurality of runs, means engaging said tape for imparting a reciprocating movement thereto, and means on one of said runs of said tape for receiving strands of filamentary material.

3,272,680

APPARATUS FOR MAKING REINFORCED RUBBER BELTING

Fritz Paasche, Cologne-Weidenpesch, Germany, assignor to Franz Clouth Rheinische Gummiwarenfabrik Aktiengesellschaft, Cologne-Nippes, Germany

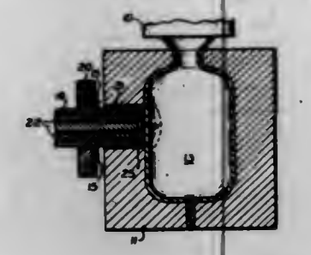
Original application Apr. 24, 1961, Ser. No. 105,087. Divided and this application Mar. 19, 1965, Ser. No. 443,774
Claims priority, application Germany, April 25, 1960, C 21,294; Feb. 3, 1961, C 23,333
12 Claims. (Cl. 156—494)

7. An apparatus for the production of belting consisting of vulcanizable rubbery material which is reinforced by metallic cords, said apparatus comprising, in combination, spaced first and second tensioning means for tensioning the cords and for subjecting the cords to identical tension; means for maintaining the cords in parallelism with each other; means reciprocable between said first and second tensioning means for applying rubbery material to the cords while the cords remain under tension; and vulcanizing means reciprocable between said applicator means and one of said tensioning means for vulcanizing the rubbery material while the cords remain under tension.

3,272,681

APPARATUS FOR APPLYING LABELS, PLATENS OR THE LIKE ON HOLLOW BODIES

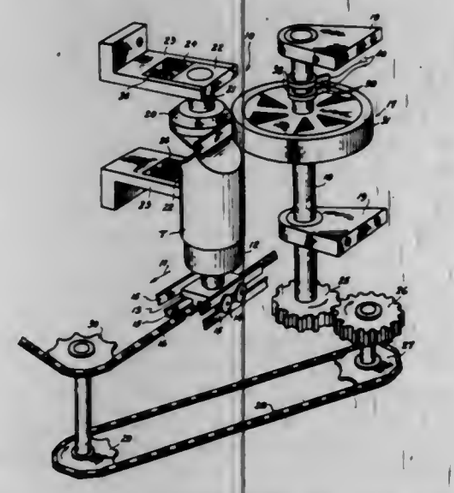
Erhard Langecker, Meinerzhagen, Westphalia, Germany, assignor to Firma Gebruder Bettenfeld, Meinerzhagen, Germany, a corporation of Germany



Original application Apr. 12, 1961, Ser. No. 102,581. Divided and this application Jan. 2, 1962, Ser. No. 163,809
Claims priority, application Germany, April 12, 1960, B 57,457
4 Claims. (Cl. 156—518)

1. An apparatus for applying markings to hollow bodies during the molding thereof, comprising

a complete hollow mold comprising two mold halves and defining an opening through one wall thereof,



means to supply an extruded hose into and received in said mold and disposed perpendicularly to the longitudinal axis of said opening,

a stamp having an operative end face complementary to said opening, and forming part of the inner wall of said mold, said stamp reciprocating in said opening of said mold during the closed position of said two form halves,

said stamp having at least one axially disposed channel adapted to be connected with a vacuum source, and means for reciprocating said stamp alternately into an inoperative position outside of said opening of said mold with said end face spaced apart from said mold and into an operative position inside said opening, for applying markings to a hollow body.

3,272,682
APPARATUS FOR JOINING THERMOPLASTIC SHEET MATERIAL WITH ULTRASONIC ROTARY VIBRATORS
Lewis Balamuth, New York, and Arthur Kuris, Riverdale, Bronx, N.Y., assignors to Cavitron Ultrasonics Inc., Long Island City, N.Y., a corporation of New York
Original application Aug. 13, 1962, Ser. No. 216,644, now Patent No. 3,224,915, dated Dec. 21, 1965. Divided and this application May 18, 1965, Ser. No. 464,594
16 Claims. (Cl. 156—580)

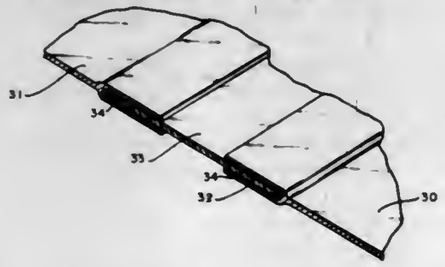
1. Apparatus for joining together overlapped sheet materials, at least one of which is thermoplastic, comprising

(A) back-up means engageable with the overlapped sheet materials at one side of the latter during the continuous advancement of the sheet materials; and

(B) a rotary vibrator mounted at the other side of the sheet materials for rotation about an axis extending transversely with respect to the direction of said continuous advancement and including

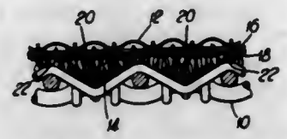
a. a magnetostrictive body of generally circular cross-section,

b. windings on said body to establish alternating electromagnetic fields producing radial vibrations in said body at the fundamental mode of vibration of the latter, and



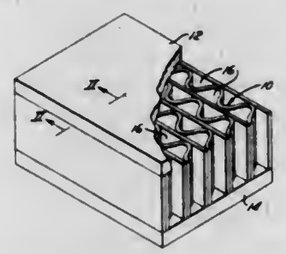
c. at least one tool member joined to the periphery of said body for radial vibration with the latter and for rolling contact with the overlapped sheet materials against said back-up means.

3,272,683
METHOD OF MAKING A PEBBLED FLOOR COVERING AND PRODUCT
Natalie S. Marcus, Trenton, N.J., and Ernest R. Holmstrom and Merrill M. Smith, Morrisville, Pa., assignors to American Biltrite Rubber Co., Inc., Chelsea, Mass., a corporation of Delaware
Filed Mar. 21, 1963, Ser. No. 267,044
8 Claims. (Cl. 161—5)



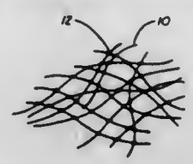
1. An elastomeric flooring of pebbled appearance and surface contour, comprising a translucent matrix of polyvinyl resin containing a random distribution of small compact pellets of glass fibers distributed in visible contact and completely enclosed within said matrix.

3,272,684
EXPANSION JOINT
Howard Nelson Moore, Kensington, Md., George W. Moore, administrator of the estate of Howard N. Moore, deceased, assignor to Lamont & Riley, Inc., Worcester, Mass., a corporation of Massachusetts
Filed Aug. 13, 1963, Ser. No. 301,799
1 Claim. (Cl. 161—37)



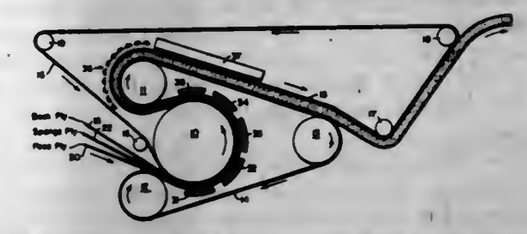
An all plastic joint for building structures comprising a plastic relatively inextensible panel member, an extensible member of an elastomeric material being highly extensible, the marginal edge of at least one of said members having a bifurcation, a marginal edge of at least part of said other member being positioned in smooth bonding contact with the inner walls of said bifurcation and a bonding cement adhering those portions of said members which are in smooth bonding contact, a second marginal edge of said other member being positioned in smooth bonding contact with an outer wall of said bifurcation and additional bonding cement adhering to those portions of said second marginal edge and said outer wall which are in smooth bonding contact, whereby said plastic joint comprises at least four layers of material securely bonded together, said bonding cement containing a material basically related in chemical structure to the chemical structure of both said members, said portion of said elastomeric material in bonding contact with said panel member having cross-linked polymers herein to such an extent that its extensibility is substantially less than that of the elastomeric material of said extensible member removed from said joint, said relatively inextensible member comprising neoprene and a filler material which renders it relatively inextensible, said elastomeric member being of neoprene and said bonding cement having a neoprene base.

3,272,685
WOVEN WATERPROOF FABRICS
Joseph Kagan, 6 Wharncliffe Grove, Frizinghall, Bradford, England
Filed May 5, 1964, Ser. No. 365,003
14 Claims. (Cl. 161—49)



1. A multi-ply fabric comprising a first ply having a multiplicity of fibres projecting substantially uniformly from all parts of one surface, and a second ply connected uniformly over one entire surface to said first ply by adhesive adherence to the ends of the projecting fibres so that the plies may move somewnat in their planes with respect to each other.

3,272,686
STRUCTURAL CERAMIC BODIES AND METHOD OF MAKING SAME
Gail P. Smith, Corning, and Guy E. Stong, Elmira, N.Y., assignors to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Mar. 23, 1962, Ser. No. 182,011
5 Claims. (Cl. 161—68)



4. A structural ceramic body comprising a ceramic honeycomb having opposed major surfaces, channels extending through said honeycomb and terminating at said surfaces, a rigid ceramic sheet ceramically bonded to each of said major faces by a composition composed, by weight, of about 1 to 16 percent of lead oxide, about 1 to 15 percent of a flux, about 1 to 6 percent of a member selected from the group consisting of silicon carbide and sulfur trioxide, and the remainder substantially all a lithium aluminosilicate ceramic material, said honeycomb, ceramic sheets and ceramic composition having a low coefficient of thermal expansion.

3,272,687
VAPOR PERMEABLE NON-WOVEN FIBROUS ELEMENT
Robert C. Harrington, Jr., James L. Smith, and James H. Bond, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed July 22, 1964, Ser. No. 384,334
5 Claims. (Cl. 161—143)

1. A vapor permeable non-woven fibrous element comprising substantially longitudinally aligned continuous filaments of polypropylene bonded at a substantial number of the intersects of said filaments with polyethylene.

3,272,688
VINYL SPONGE LAMINATE
Ernest R. Holmstrom, Morrisville, David K. Sloeberg, Yardley, and Merrill M. Smith, Morrisville, Pa., assignors to American Biltrite Rubber Co., Inc., Chelsea, Mass., a corporation of Delaware
Filed May 26, 1965, Ser. No. 459,003
1 Claim. (Cl. 161—161)

A laminated underlayment comprising outer cover plies of asbestos felt impregnated and reinforced with an elastomeric component, in combination with an intermediate vinyl ply of blown sponge consistency which is bonded to the inner faces of the cover plies by penetration of the vinyl structure into the interstices of the felt cover plies, said intermediate vinyl ply of blown sponge consistency consisting of two coextensive ply sections united in face-to-face engagement.

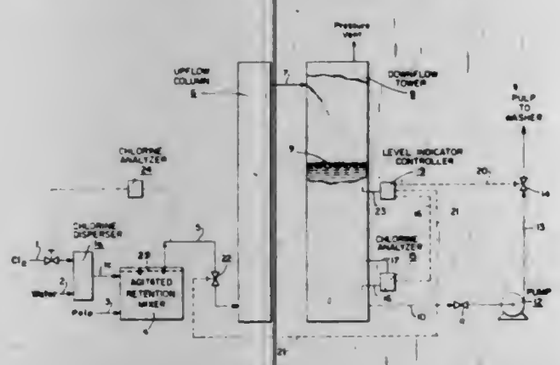
3,272,689
DELIGNIFICATION OF LIGNOCELLULOSE WITH AN N-(LOWER ALKYL)-2-PYRROLIDONE
Bernard L. Lenz, Stockholm, Sweden, assignor to Owens-Illinois, Inc., a corporation of Ohio
No Drawing. Filed Feb. 4, 1963, Ser. No. 256,131
8 Claims. (Cl. 162—72)

1. A method of delignification which comprises treating wood with a reagent which comprises water and an N-(lower alkyl)-2-pyrrolidone in a weight ratio of from 1:20 to 1:1 at a temperature between 80° C. and 200° C. for a time of about ½ hour to 24 hours and separating a lignin-enriched phase containing said pyrrolidone from a cellulose-enriched pulp phase.

3,272,690
METHOD OF IMPROVING THE WET STRENGTH OF PAPER BY ADDITION OF ETHYLENE-VINYL ACETATE COPOLYMER THERETO
Anna M. Shadan, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma
No Drawing. Filed June 26, 1963, Ser. No. 290,640
10 Claims. (Cl. 162—169)

1. A method of improving the wet strength of paper which comprises mixing with the paper pulp which is to be used for making said paper an emulsion composition comprising water, an emulsifying agent and from about 0.25 percent by weight to about 40 percent by weight, based on the dry pulp, of a wax-copolymer mixture comprising from about 50 parts by weight to about 99 parts by weight wax and from about 1 part by weight to about 50 parts by weight of an ethylene-vinyl acetate copolymer containing from about 10 percent by weight to about 40 percent by weight vinyl acetate and having a melt index of from about 3 to about 500, and forming the treated paper pulp thus obtained into paper.

3,272,691
APPARATUS FOR CONTINUOUSLY CHLORINATING PULP INCLUDING AUTOMATIC CONTROL OF THE DEGREE OF CHLORINATION
Brian L. Shera, Tacoma, Wash., assignor to Pennsalt Chemicals Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed Feb. 12, 1964, Ser. No. 344,433
4 Claims. (Cl. 162—252)



1. Apparatus for continuously chlorinating cellulosic pulp comprising in combination

chlorine gas disperser means having inlets for chlorine gas and water and an outlet for dispersed chlorine gas;

retention chlorinator mixer means connected to the outlet of said dispenser means and having an inlet for said pulp suspended in water; said mixer means being provided with agitator means and being of sufficient capacity to retain an ingoing portion of the pulp in contact with dispersed chlorine gas entering said mixer means from said dispenser means in said mixer means for a period of at least about 1½ minutes; said mixer having an outlet for said pulp;

upflow chlorinating means having a bottom inlet connected to the outlet of said mixer means to receive pulp from said mixer means and having an outlet for said pulp in its upper section;

downflow chlorinator retention means having an upper section arranged to receive pulp discharged from said upflow chlorinator means; said downflow means being larger in capacity than said upflow means; said downflow means being provided with an outlet near its bottom section;

chlorination endpoint determination means including signalling means disposed at the lower level of said downflow means to substantially continuously test pulp at said lower level to determine attainment of a predetermined chlorination state of said pulp;

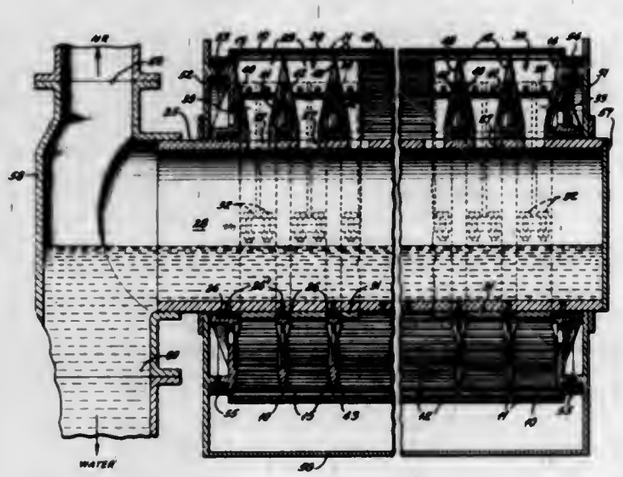
liquid level indicator and controller means associated with said downflow means and arranged to receive signals from said determination means;

outlet control means associated with the outlet of said downflow means and connected to said controller means to respond to signals from said determination means;

said determination means cooperating with said controller means and said outlet control means to retain pulp in said downflow means until a predetermined chlorination endpoint has been attained and the opening said outlet means to discharge chlorinated pulp from said downflow means, thereby maintaining the level in said downflow means substantially constant and limiting retention of said pulp in said downflow tower to a period at least sufficient but not substantially longer than sufficient to attain the desired endpoint of chlorination.

3,272,692
PRESSURE FORMING APPARATUS IN PAPER MAKING INCLUDING A SUCTION CYLINDER MOLD

Millard F. Hayes and Robert M. Hayes, both of P.O. Box 92, Hudson Falls, N.Y.



Filed Jan. 20, 1964, Ser. No. 339,011
10 Claims. (Cl. 162—317)

1. Apparatus including a suction roll, for use in paper manufacture, and which comprises

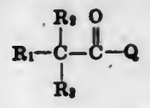
a long cylindrical central hollow stationary core forming an axis for the roll,

a pair of end spiders and a plurality of intermediate spiders each rotatably mounted on said core and spaced apart axially therealong,

a wire mesh face of cylindrical shape mounted on said spiders for rotation therewith about said core and forming a porous cylindrical covering for the roll to support paper fibers traveling in the direction of rotation of the roll, along an arc extending part way around the periphery thereof,

said core having a plurality of slots each extending between an adjacent pair of spiders and through the wall of the core into its central chamber,

a different water collector mating with each of said slots and extending radially outward therefrom, each said collector defining an inner air and water passage extending from adjacent the inner surface of the face to its respective said slot,



an air pump connected to said central chamber to pump air therefrom so that air and water are pulled through said mesh face into the chamber of said core, and means for discharging the air and water from said chamber.

3,272,693
METHODS OF CONTROLLING FUNGI WITH ALPHA,ALPHA-DIALKYL AND ALKYLENE ALIPHATIC ACIDS AND SALTS THEREOF

Jean Bradley Harrison, Niagara Falls, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed July 20, 1964, Ser. No. 383,922
6 Claims. (Cl. 167—22)

1. A method for the control of fungi, said method comprising applying to fungi a fungicidally effective amount of a compound of the formula:

wherein

Q is selected from the group consisting of OR_4 and chlorine;

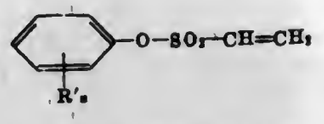
R_1, R_2 and R_3 are each selected from the group consisting of alkyl containing 1 through 10 carbon atoms and alkenyl containing 2 through 10 carbon atoms, with the limitation that R_1, R_2 and R_3 added together will contain at least 6 carbon atoms and not more than 12 carbon atoms; and

R_4 is selected from the group consisting of hydrogen, sodium, potassium, calcium, magnesium, zinc, manganese, copper, iron, nickel, cadmium, basic salts of zinc, manganese, cadmium, copper, iron and nickel, ammonium, mono-, di- and tri-(alkyl)ammonium where each alkyl group has 1 through 4 carbon atoms, mono-, di- and tri-(alkoxyalkyl)ammonium where the alkoxy and alkyl group each has 1 through 4 carbon atoms, mono-, di- and tri-(hydroxyalkyl)ammonium where the alkyl group has 1 through 4 carbon atoms.

3,272,694
SEVIN-LINDANE INSECTICIDAL FUMIGATING COMPOSITION AND METHOD

Gordon N. Emby, Northrand, Transvaal, Republic of South Africa, assignor to African Explosives and Chemical Industries Limited, Johannesburg, Transvaal, South Africa

No Drawing. Filed Apr. 26, 1963, Ser. No. 276,080
Claims priority, application Republic of South Africa, Apr. 27, 1962, 62/1,763
4 Claims. (Cl. 167—30)



4. An insecticidal fumigating composition comprising as the active ingredients a major quantity of 1-naphthyl N-methyl carbamate, and a minor quantity of lindane, and which includes also a deflagration composition consisting of potassium chlorate and thiourea, an extender consisting of gypsum, and a binder consisting of shellac.

3,272,695
VINYL-SULPHONIC ACID ESTER FUNGICIDES

Paul-Ernst Frohberger, Burscheid, Hansbelmut Schlör, Wuppertal-Barmen, and Rudolf Kress and Rudolf Heiss, Cologne-Stammheim, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Feb. 25, 1964, Ser. No. 347,129
Claims priority, application Germany, Mar. 12, 1963, F 39,226
6 Claims. (Cl. 167—30)

1. A method for combating fungi which comprises applying to said fungi an effective amount of a vinylsulphonic acid ester of the formula

wherein

R′ is a member selected from the group consisting of halo, nitro, alkyl of 1–6 carbon atoms, alkoxy of 1–4 carbon atoms, amino, alkyl amino of 1–4 carbon atoms in the alkyl radical, alkyl mercapto of 1–4 carbon atoms, alkenyl of 2–6 carbon atoms and the $-O-SO_2-CH=CH_2$ group; and

n is a whole number of 0–3.

3,272,696
PORFIROMYCIN INSECTICIDE

Paul W. O'Connell, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed Apr. 27, 1964, Ser. No. 362,940
15 Claims. (Cl. 167—30)

1. The process of rendering insects reproductively sterile which comprises inducing insects to ingest an effective amount of profiromycin.

3,272,697
PACTAMYCIN INSECTICIDE

Alan J. Lemin, Richland Township, Kalamazoo County, and Paul W. O'Connell, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

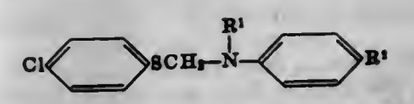
No Drawing. Filed Apr. 30, 1964, Ser. No. 363,978
12 Claims. (Cl. 167—30)

1. The process of controlling insects which comprises applying to said insects an effective amount of pactamycin.

3,272,698
SPARSOMYCIN A INSECTICIDE

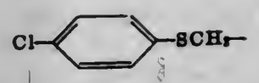
Alan J. Lemin, Richland Township, Kalamazoo County, and Paul W. O'Connell, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed Apr. 30, 1964, Ser. No. 363,998
11 Claims. (Cl. 167—30)



1. The process of controlling insects which comprises applying to said insects an effective amount of sparsomycin A.

3,272,699
N-(4-CHLOROPHENYLTHIOMETHYL)-ANILINE FUNGICIDES



Philip T. S. Lau, Rochester, and Gerald F. Grillot, Syracuse, N.Y., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed May 22, 1964, Ser. No. 369,595
6 Claims. (Cl. 167—30)

4. The process for preventing and retarding fungus growth on living plants which comprises applying to said plants an aqueous dispersion of an N-(4-chlorophenylthiomethyl)-aniline of the formula:

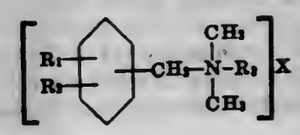
wherein R^1 is a member selected from the group consisting of hydrogen and

and R^2 is a member selected from the group consisting of $-NO_2$ and $-OCH_3$, in the proportions of between about ¼ pound and about 2 pounds of the N-(4-chlorophenylthiomethyl)-aniline compound per 100 gallons of water.

3,272,700
STABILIZED AQUEOUS SOLUTION OF TETRACAINE SALT

Irwin S. Sharpe, North Greenbush, N.Y., assignor to Sterling Drug Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 3, 1963, Ser. No. 313,422
1 Claim. (Cl. 167—52)



A stabilized aqueous solution of a pharmaceutically-acceptable acid-addition salt of 2-dimethylaminoethyl 4-n-butylaminobenzoate having as the stabilizing agent between about 0.4 to about 1.0 percent tyloxapol per 0.1 to 2 percent of said benzoate.

3,272,701
FREE FLOWING MEDICATED DRINKING WATER FOR POULTRY AND ANIMALS

Charles Kaitz, Vineland, N.J., and Leon Merson, Los Angeles, Calif., assignors, by mesne assignments, to Vineland Laboratories, Inc., Landis Township, N.J., a corporation of New Jersey

No Drawing. Filed Feb. 27, 1962, Ser. No. 176,138
5 Claims. (Cl. 167—53)

1. A composition for providing free-flowing medicated drinking water for poultry and animals which comprises at least one therapeutic substance selected from the group consisting of vitamins and antibiotics in admixture with about 4% to about 13% of a quaternary ammonium salt by weight based on the weight of said therapeutic substance, said quaternary ammonium salt having the formula:

in which R_1 is selected from the group consisting of hydrogen and alkyl having from one to four carbon atoms, R_2 is selected from the group consisting of hydrogen and alkyl having from ten to sixteen carbon atoms, R_3 is selected from the group consisting of alkyl having from one to eighteen carbon atoms, alkoxy, phenoxyalkoxyalkyl and cresoxyalkoxyalkyl, and X is an inorganic anion.

3,272,702
GROWTH PROMOTANT PROCESS
Maurice A. Schooley, White Plains, N.Y., and Byron M. Shinn, Western Springs, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Feb. 6, 1963, Ser. No. 256,542
The portion of the term of the patent subsequent to April 16, 1980, has been disclaimed
11 Claims. (Cl. 167—53)

1. A process for promoting growth in animals, comprising the steps of introducing into said animals a synthetic estrogenic substance and a substantially water-insoluble salt of a cationic surfactant.

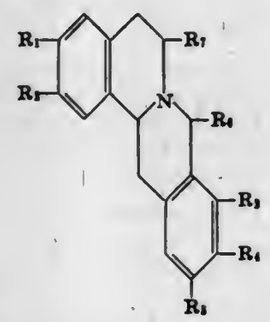
3,272,703
ANTACID COMPOSITION AND PROCESS OF MAKING THE SAME
Andrew M. Rubino, New Providence, and James J. Martin, Jr., Old Bridge, N.J., and John E. Garizio, Garden City, N.Y., assignors, by mesne assignments, to Armour Pharmaceutical Company, Chicago, Ill., a corporation of Delaware
Filed Oct. 25, 1962, Ser. No. 233,010
21 Claims. (Cl. 167—55)

1. A process for preparing an antacid composition capable as determined by the Holbert, Noble and Grote test method of maintaining the pH of artificial gastric juice within the range from about 3 to about 5 for at least one hour, which comprises mixing an aqueous medium of (a) a solution of an alkali metal aluminate, selected from the group consisting of sodium aluminate and potassium aluminate (b) a solution of at least one water-soluble salt of calcium and magnesium, selected from the class of salts consisting of chloride, bromide, iodide and nitrate, and (c) a solution containing sufficient alkali, selected from the class consisting of sodium hydroxide, potassium hydroxide, sodium carbonate and potassium carbonate, to provide and maintain said media at a pH of from about 9 to about 10, to form a coprecipitate complex comprising aluminum, at least one member selected from the group consisting of magnesium and calcium, and hydroxide ions, and reacting the coprecipitate complex with carbon dioxide at a solution pH within the range from about 6 to about 10 whereupon a carbonated coprecipitate complex is formed having a molecular weight ratio calculated as Al_2O_3:MO within the range of about 4:1 to about 1:10, wherein M represents at least one member selected from the group consisting of magnesium and calcium.

3,272,704
STABLE ALUMINUM HYDROXIDE-MAGNESIUM COMPOUND CODRIED GEL ANTACIDS AND PROCESS OF MAKING THE SAME
Stewart M. Beekman, Chatham, N.J., assignor, by mesne assignments, to Armour Pharmaceutical Company, Chicago, Ill., a corporation of Delaware
Filed June 6, 1963, Ser. No. 286,040
16 Claims. (Cl. 167—55)

1. An antacid composition capable as determined by the modified Holbert, Noble and Grote test method of maintaining the pH of artificial gastric juice within the range from about 3 to about 5 for at least one hour, comprising the codried combination of a hydrous gelatinous aluminum hydroxide material selected from the group consisting of aluminum hydroxide and aluminum hydroxy carbonate and a gelatinous magnesium compound selected from the group consisting of magnesium hydroxide, magnesium carbonate and magnesium trisilicate in an atomic ratio Al:Mg within the range from about 2:1 to about 0.25:1 and from 2–200 percent of a hexitol selected from the group consisting of sorbitol and mannitol.

3,272,705
LAXATIVE COMPOSITION AND METHOD OF USING SAME
Friedrich Petuely, Graz, Austria, assignor, by mesne assignments, to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed June 13, 1963, Ser. No. 287,519
8 Claims. (Cl. 167—56)



1. A method of improving intestinal peristalsis in constipated humans comprising daily orally administrating to said humans at least 0.05 gms. of lactulose per kg. of body-weight and in an amount effective to treat said constipation.

3,272,706
CRYSTALLIZATION OF ACTINOSPECTACIN SULFATE WITH METHANOL
Vincent J. Peters, Morris Plains, N.J., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware
No Drawing. Filed Aug. 2, 1961, Ser. No. 128,687
4 Claims. (Cl. 167—65)

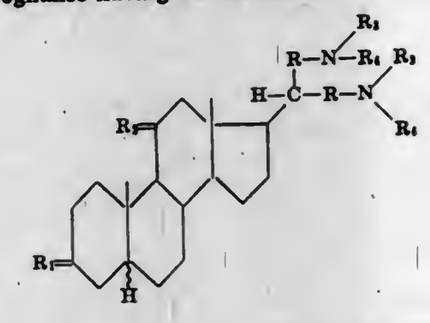
4. The process for crystallizing actinospectacin sulfate from aqueous solutions containing the same which comprises adding about 3 to about 5 parts of methanol to 1 part of the aqueous solution at about pH 6 to about pH 7, immediately filtering to remove any precipitate, allowing the actinospectacin sulfate to crystallize at a temperature between 20° C. and 50° C., and recovering the crystals of actinospectacin sulfate thus formed at a temperature between 0° C. and 15° C.

3,272,707
PHARMACEUTICAL COMPOSITIONS AND METHODS FOR THEIR USE
David H. Tedeschi, Pennsauken, N.J., assignor to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed July 17, 1964, Ser. No. 383,504
11 Claims. (Cl. 167—65)

3. A method of producing tranquilizing and antidepressant activity which comprises internally administering to an animal requiring tranquilization and antidepression an effective amount of a compound selected from the group consisting of a 5,6,13,13a-tetrahydro-8-dibenzo-(a,g)-quinolizine and a nontoxic pharmaceutically acceptable acid addition salt thereof, said dibenzo-(a,g)-quinolizine having the following formula:

in which:

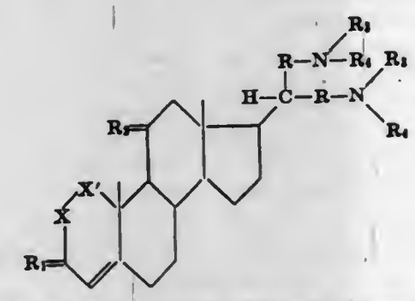
R_1 and R_2 are members selected from the group consisting of hydrogen, hydroxy, methoxy, ethoxy and, when taken together, methylenedioxy;



R_3 and R_8 are members selected from the group consisting of hydrogen and methoxy;

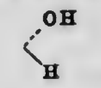
R_4 is a member selected from the group consisting of hydrogen, hydroxy, methoxy and ethoxy; and

R_6 and R_7 are members selected from the group consisting of hydrogen and methyl.



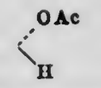
3,272,708
20-AMINOMETHYL-21-AMINO-PREGNANES AND THERAPEUTIC COMPOSITIONS THEREOF
Daniel Bertin, Montrouge, Lucien Nedelec, Clichy-sous-Bois, Seine et Oise, and Jacques Perronnet, Paris, France, assignors to Roussel-UCLAF, Paris, France, a corporation of France
No Drawing. Filed Feb. 28, 1964, Ser. No. 348,303
Claims priority, application France, June 9, 1961, 864,451, Patent 1,373,654; Mar. 4, 1963, 926,732; May 7, 1963, 933,956
19 Claims. (Cl. 167—65)

1. A compound selected from the group consisting of amino pregnanes having the formulas:

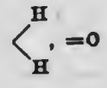


(IA)

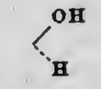
and



(IB)

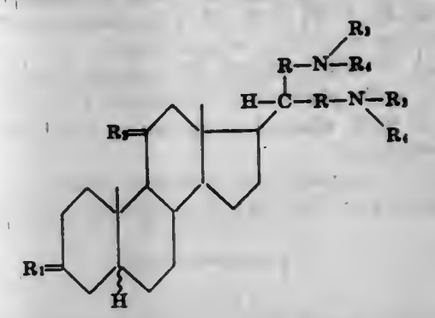


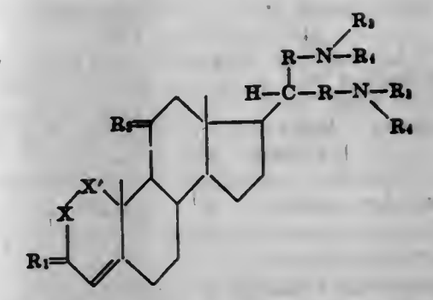
wherein the R's are the same and are selected from the group consisting of methylene and ethylene radicals, R_1 is selected from the group consisting =O,



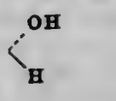
and

Ac is an acyl radical of an organic carboxylic acid having 1 to 18 carbon atoms, R_2 selected from the group consisting of



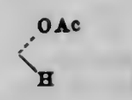


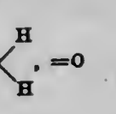
and



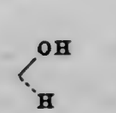
X–X' represents a radical selected from the group consisting of ethylene and vinylene, R_3 and R_4 are selected from the group consisting of hydrogen and lower alkyl, phenyl, phenyl lower alkyl and lower alkyl phenyl radicals and when taken together with the nitrogen atom R_3 and R_4 form a heterocyclic radical selected from the group consisting of morpholino, piperidino and pyrrolidino, and the non-toxic, pharmaceutically acceptable acid addition salts thereof.

8. The method of treating spasms of vascular origin in warm blooded animals which comprises administering daily an effective amount of a compound selected from the group consisting of amino pregnanes having the formulas





wherein the R's are the same and are selected from the group consisting of methylene and ethylene radicals, R_1 is selected from the group consisting of =O,



and

Ac is an acyl radical of an organic carboxylic acid having 1 to 18 carbon atoms, R_2 is selected from the group consisting of

and

X–X' represents a radical selected from the group consisting of ethylene and vinylene, R_3 and R_4 are selected from the group consisting of hydrogen and lower alkyl, aryl phenyl, phenyl lower alkyl and lower alkyl phenyl, and when taken together with the nitrogen atom R_3 and R_4 form a heterocyclic radical selected from the group consisting of morpholino, piperidino and pyrrolidino and the non-toxic, pharmaceutically acceptable acid addition salts thereof.

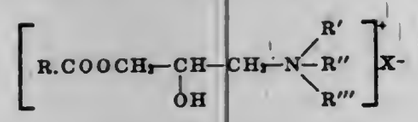
3,272,709
ANTIBIOTIC MELROSPORUS AND METHOD OF PRODUCTION
Malcolm E. Bergy, Kalamazoo, and William L. Lummis, Alamo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware
Filed Apr. 22, 1964, Ser. No. 361,849
7 Claims. (Cl. 167—65)

1. A composition of matter, assaying at least 12.4 mcg./mg. of melrosporus, a compound which

(a) is effective in inhibiting the growth of various gram-positive and gram-negative bacteria;

(b) is soluble in water, methanol, ethanol, ethyl acetate, 1-butanol, 2-butanol; slightly soluble in ether, hexane, and cyclohexane; and which in its essentially pure crystalline form
(c) has the following elemental analysis: C, 41.43, 41.68; H, 5.16, 5.06; N, 9.36, 9.59; O, 43.75;
(d) has the molecular weight of 147;
(e) has a characteristic ultraviolet absorption spectrum with maximum absorptivity of 152 at 290 mμ in 95% ethanol as shown in FIGURE II of the drawing; and
(f) has a characteristic infrared absorption spectrum as shown in FIGURE I of the accompanying drawing.

3,272,710
ANTIANDROGENIC COMPOSITIONS AND METHODS OF USE
Leonard J. Lerner, New Brunswick, and Frank L. Weisenborn, Somerset, N.J., assignors to E. R. Squibb & Sons, Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed Oct. 21, 1965, Ser. No. 500,286
8 Claims. (Cl. 167—74)

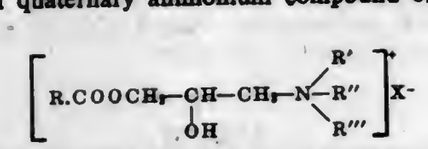


8. A process for producing an anti-androgenic effect which comprises administering to an animal species having a hyper-androgenic condition a composition comprising A-nor-5β-pregnane-2,20-dione in a pharmaceutical carrier therefor in a dosage of about 25 mg. to 250 mg.

3,272,711
SKIN TREATING COMPOSITIONS
Sidney J. M. Walker, Apt. 606, 64 St. Clair Ave. W., Toronto, Ontario, Canada
No Drawing. Filed July 23, 1963, Ser. No. 296,933
Claims priority, application Canada, July 27, 1962, 854,690
3 Claims. (Cl. 167—86)

1. A composition of matter comprising substantially 12 parts of sodium hexadecyl sulphate and substantially 18 parts of sodium bicarbonate.

3,272,712
QUATERNARY AMMONIUM SALTS OF ESTERS OF FATTY ACIDS AND A PRECURSOR OF AMINO-2-HYDROXY PROPANOL, METHODS OF THEIR PREPARATION AND THEIR USE
Gregoire Kalopissis, Paris, and Guy Vanlerberghe, Villiers-le-Bel, France, assignors to Societe Anonyme dite: L'Oreal, a corporation of France
No Drawing. Original application Oct. 29, 1962, Ser. No. 233,909. Divided and this application May 20, 1965, Ser. No. 469,018
Claims priority, application France, Nov. 2, 1961, 877,753
18 Claims. (Cl. 167—87)



1. A quaternary ammonium compound of the formula:

wherein

(a) R represents a hydrocarbon group of 10 to 18 carbon atoms;
(b) R' and R'' are selected from the group consisting of alkyl groups of 1 to 4 carbon atoms, hydroxyalkyl groups of 1 to 4 carbon atoms, and together with the nitrogen atom form a morpholine, piperidine or pyrrolidine group;
(c) R''' is selected from a group consisting of alkyl groups of 1 to 4 carbon atoms, hydroxyalkyl groups of 1 to 4 carbon atoms and an alkylphenyl group;
(d) and X is an anion.

10. A hair shampoo preparation which consists essentially of a quaternary ammonium compound of the formula:

wherein

(a) R represents a hydrocarbon group of 10 to 18 carbon atoms;
(b) R' and R'' are selected from the group consisting of alkyl groups of 1 to 4 carbon atoms, hydroxyalkyl groups of 1 to 4 carbon atoms, and together with the nitrogen atom form a morpholine, piperidine or pyrrolidine group;
(c) R''' is selected from a group consisting of alkyl groups of 1 to 4 carbon atoms, hydroxyalkyl groups of 1 to 4 carbon atoms and an alkylphenyl group;
(d) and X is an anion, together with an inert carrier.

3,272,713
ACTINIC RADIATION PROTECTION BY COMPOSITIONS COMPRISING QUINONES AND CARBONYL CONTAINING COMPOUNDS
Walter J. Runge, St. Paul, Minn., assignor to The Regents of the University of Minnesota, Minneapolis, Minn., a corporation of Minnesota
No Drawing. Filed June 15, 1962, Ser. No. 202,674
16 Claims. (Cl. 167—90)

8. A method for protecting human skin from actinic radiation of wave length between about 2900 and 26,850 angstroms which comprises applying to the skin a dissolved mixture of a quinone selected from the class consisting of alpha and beta tautomers of 1,4-benzo- and 1,4-naphtho-quinones and a carbonyl containing compound selected from the class consisting of dihydroxyacetone, 5-(hydroxymethyl)-2-furaldehyde, pyruvic aldehyde, glyceraldehyde, alloxan and monohydroxyacetone, said quinone and carbonyl containing compound being dissolved in a mutual non-irritating organic solvent.

3,272,714
METHOD OF PRODUCING RIBONUCLEIC ACID
Kiyoshi Watanabe, Takasago, Japan, assignor to Kanegafuchi Chemical Industry Company, Limited, Osaka, Japan, a corporation of Japan
No Drawing. Filed Dec. 9, 1963, Ser. No. 329,305
Claims priority, application Japan, July 2, 1963, 34,835
1 Claim. (Cl. 195—28)

A process for producing yeast ribonucleic acid which comprises culturing a yeast in an aqueous nutrient medium under aerobic conditions wherein the oxygen absorption coefficient is at least 10×10^{-6}, the aqueous nutrient medium being artifically supplemented by zinc ion at a concentration of at least 0.25 p.p.m. and having a phosphate ion concentration of at least 0.15% by weight, and extracting and recovering ribonuclei acid from the yeast.

3,272,715
METHOD FOR PRODUCING AND RECOVERING 6-AMINOPENICILLANIC ACID
Norman H. Grant, Wynnewood, and Harvey E. Alburn, West Chester, Pa., assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed July 17, 1962, Ser. No. 210,575
5 Claims. (Cl. 195—36)

1. The process of converting penicillin in an aqueous medium to 6-aminopenicillanic acid and recovering the latter from said medium, which process comprises:
(A) preparing an aqueous slightly alkaline mixture including penicillin and resuspended cells of a micro-organism that produces amidase capable of cleaving the penicillin at C_6, said micro-organism being selected from the group consisting of *Alcaligenes faecalis*, *E. coli* and *Fusarium equiseti*;
(B) thereafter, incubating said mixture for a period sufficient to cause formation of 6-aminopenicillanic acid; and
(C) then processing said incubated mixture by (1) removing said cells therefrom, (2) adjusting the pH thereof to the range 1.5–3.0, (3) extracting therefrom a compound resulting from the hydrolysis of the acyl side chain of said penicillin, (4) adjusting the pH thereof to the range 3.0–5.0, and (5) concentrating from 10 to 100 fold to crystallize 6-aminopenicillanic acid therefrom.

3,272,716
MICROBIAL OXIDATION OF NAPHTHALENE TO SALICYLIC ACID IN THE PRESENCE OF AN ALUMINUM COMPOUND
Mayer B. Goren, Golden, Colo., and James E. Zajic and William J. Dunlap, Oklahoma City, Okla., assignors to Kerr-McGee Oil Industries, Inc., a corporation of Delaware
No Drawing. Filed Oct. 24, 1963, Ser. No. 318,499
15 Claims. (Cl. 195—51)

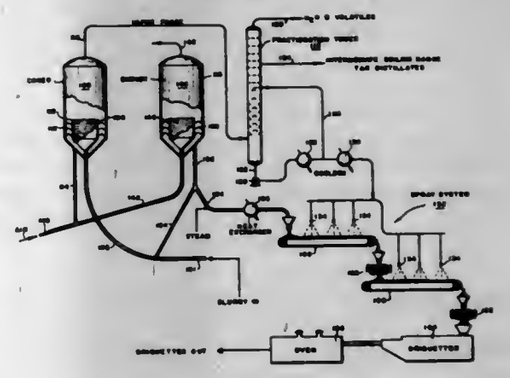
1. A process for preparing salicylic acid comprising cultivating a microorganism capable of oxidizing naphthalene to salicylic acid of the genus Pseudomonas in an aqueous nutrient medium containing naphthalene and an added aluminum compound to thereby microbiologically oxidize the naphthalene to salicylic acid.

3,272,717
PROCESS FOR PREPARING THERMALLY STABLE AMYLASE COMPOSITION
Juichiro Fukumoto, 4–227 Kirihata, Aza-Nagoyama, Takarazuka, Japan, and Hideo Negoro, 549–38 Tarumi, Suita, Japan
No Drawing. Filed Jan. 27, 1964, Ser. No. 340,549
Claims priority, application Japan, Jan. 26, 1963, 38/3,827
2 Claims. (Cl. 195—68)

1. A process for preparing thermally stable amylase composition, which comprises mixing starch-liquefying amylase produced by a strain of mesophilic, aerobic bacteria, with a cationic surface active agent in an aqueous medium at a pH of 6.0–6.5, filtering the treated mixture, adding an organic solvent and starch successively to the thus-formed amylase complex contained in the filtrate, filtering the precipitate, and drying it.

3,272,718
MALTING OF BARLEY AND OTHER CEREALS
Alan A. Douglas Comrie, Manchester, and Bernard Dixon, Greygates, Harpenden, England, assignors to The Enzymic Malt Company Limited and the Dixon Malt Company Limited, both of London, England
No Drawing. Filed Aug. 24, 1962, Ser. No. 219,111
8 Claims. (Cl. 195—70)

1. A method of malting cereal, which comprises steeping grain at a temperature of 22° C. to 50° C. for periods of from one to 32 hours, the length of period varying approximately inversely as the temperature, the steep preferably being aerated for at least part of the period and the temperature being optionally varied in the course of the steep, draining away the steep water and subjecting the grain to a germination period of 20 to 72 hours at a temperature of 12° C. to 30° C.; and subjecting the grain after germination and during a modification phase to anaerobic treatment by displacing the atmosphere surrounding the grain by an inert non-toxic substance from the group consisting of water, carbon dioxide, and nitrogen for a period of 1 to 48 hours at a temperature of up to 40° C.

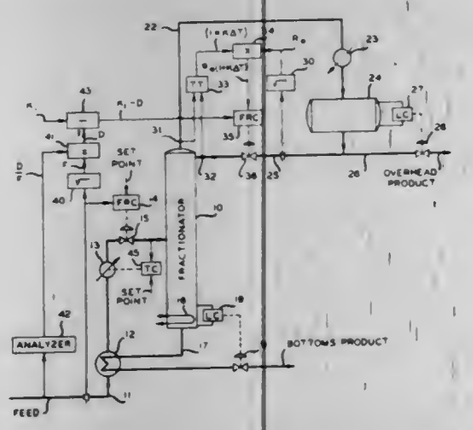


3,272,719
METHOD AND APPARATUS FOR DETERMINING THE SENSITIVITY OF BODY FLUID INFECTANTS TO DRUGS
Souren Avakian, Westport, Conn., assignor to The Denver Chemical Manufacturing Company, Stamford, Conn., a corporation of Colorado
Filed Aug. 6, 1964, Ser. No. 387,933
8 Claims. (Cl. 195—103.5)

1. A method for determining the sensitivity of pathogens in infected body fluids to the action of various drugs in varied concentrations simultaneously which comprises providing a container made of a flat plate having a plurality of adjacent isolated open top compartments, each compartment containing sterile nutrients and different known concentrations of a drug under test, saturating a narrow elongated strip of bibulous material with a sample of said infected fluid, laying said saturated strip across a plurality of said compartments and at each compartment permitting said strip to sag into said nutrient, covering and incubating the treated container, and after incubation counting the bacterial colonies in each compartment.

4. A kit for determining the sensitivity of pathogens in infected body fluids to the action of various drugs which apparatus comprises a flat plate provided on its upper surface with a series of adjacent compartments containing a pool of bacterial nutrient, a flat cover therefor and a plurality of elongated flexible bibulous strips, said compartments being separated by partition walls, and retaining means on walls between adjacent compartments adapted to receive and prevent inadvertent sideways displacement of said strips when laid across said compartments.

3,272,720
COKING PROCESS
Nick P. Peet, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N.J., a corporation of Delaware
Filed Mar. 25, 1963, Ser. No. 267,674
4 Claims. (Cl. 201—5)



1. A method of producing coke briquettes from a water slurry of finely divided coal, said slurry containing from 50 to 70 weight percent of coal having a particle size distribution within the range of 325 mesh to 8 mesh, U.S. Standard, which comprises

contacting said slurry in a coking zone with a hot coke stream to form an admixture of coal particles and steam at a coking temperature within the range of 900° F. to 1100° F., maintaining said admixture at said coking temperature for a time sufficient to drive off substantially all of the water and carbonaceous material and reduce said coal to coke,
separating said carbonaceous material from said coke,
contacting said coke in a burning zone with a stoichiometric deficiency of oxygen at a temperature of 1200° F. to 1600° F. to consume from 3 to 10 weight percent of said coke,
withdrawing said coke from said burning zone as a hot coke stream,
recycling a first portion of said hot coke stream into contact with said slurry in said coking zone,
cooling a second portion of said hot coke stream to 250° F.to 350° F. to obtain a coke product stream,
admixing said coke product stream with a portion of said carbonaceous materials to obtain a briquetting charge stream,
and forming briquettes from said charge stream.

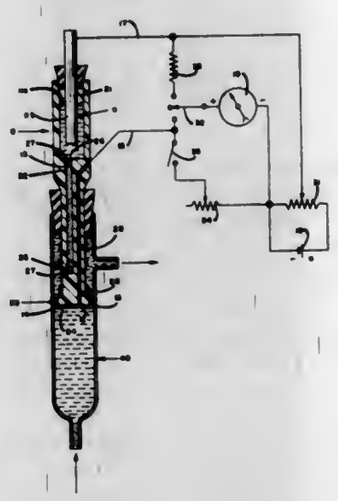
3,272,721
PROCESS FOR DESULFURIZING AND COKING HIGH SULFUR CONTENT COAL
Hirsch Loevenstein, Los Angeles, Calif., assignor to Harvey Aluminum Incorporated, Torrance, Calif., a corporation of California
No Drawing. Filed Nov. 21, 1963, Ser. No. 325,450
10 Claims. (Cl. 201—36)

1. A coking process comprising heating coal which contains a substantial amount of sulfur and at least 3% volatiles wherein said coal is continuously heated at gradually increasing temperature levels varying from about 500° C. to about 800° C., the coal not having been previously ground to a finely subdivided state and having a particle size of at least 5 millimeters, said heating being performed over a period of at least two hours during which time at least 2% volatiles are retained in the coal and whereby a substantial amount of sulfur is removed, and then heating said desulfurized coal at a temperature above about 800° C. for a time sufficient to produce coke therefrom.

3,272,722
FRACTIONAL DISTILLATION PROCESS AND SYSTEM CONTROL FOR MAXIMUM VAPOR LOAD
Harry L. Walker, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Apr. 18, 1962, Ser. No. 188,413
8 Claims. (Cl. 203—2)

8. In a fractionation process wherein a fluid mixture to be separated is introduced into a fractionation zone, a kettle product stream is withdrawn from the lower region of said zone, a vapor stream is withdrawn from the upper region of said zone, said vapor stream is cooled to condense same, a potion of the resulting condensate is returned to said zone as external reflux, and the remainder of said condensate is removed as an overhead product stream; a method of controlling the reflux to be employed in said zone to permit a maximum vapor load which comprises establishing a first signal F which is representative of the flow of the fluid mixture to said zone; measuring the composition of the feed mixture and establishing a second signal which is representative of the quantity (D/F), where (D/F) is the volume percent in the fluid mixture of the components therein to be removed from said zone as said overhead product stream; multiplying the second signal by the first signal to establish a product signal D; subtracting the product signal D from a reference signal K_1 to establish a control signal which is representative of the maximum vapor load capacity of said zone which does not result in flooding; and adjusting the rate of flow of said external reflux in response to said control signal.

3,272,723
PURIFICATION OF XYLENES FROM STYRENE BY DISTILLATION IN THE PRESENCE OF COMBINED AZEOTROPING AGENT AND SOLVENT ADDITIVE
Loyd W. Fannin, Bridgeton, Mo., assignor to Monsanto Company, a corporation of Delaware
No Drawing. Filed Oct. 24, 1962, Ser. No. 232,858
8 Claims. (Cl. 203—51)



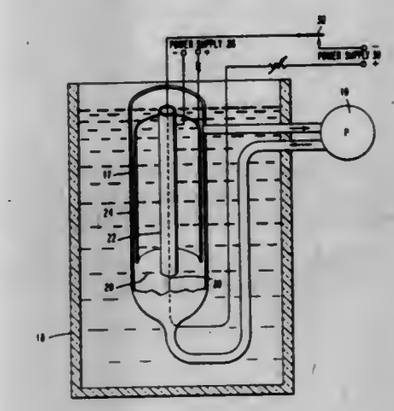
1. A process for the separation of an aromatic hydrocarbon mixture containing vinyl aromatic hydrocarbons and alkyl aromatic hydrocarbons which comprises subjecting such aromatic hydrocarbon mixture to distillation in the presence of a solvent comprised of an organic salt of a metal from Group II–B of the periodic table and an acyclic aliphatic acid of less than 5 carbon atoms, recovering from said distillation an overhead distillate containing said acyclic aliphatic acid and an alkyl aromatic hydrocarbon fraction substantially richer in alkyl aromatic hydrocarbons than the original aromatic hydrocarbon mixture, and recovering a bottoms containing said organic salt of a metal from Group II–B of the periodic table and a vinyl aromatic hydrocarbon fraction substantially richer in vinyl aromatic hydrocarbons than said original aromatic hydrocarbon mixture.

3,272,724
PROCESS FOR THE RECOVERY OF HEXAHYDROAZEPINE
George W. Rigby, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Mar. 7, 1963, Ser. No. 263,437
1 Claim. (Cl. 203—81)

A process for the recovery of hexahydroazepine from a waste stream mixture of about 3 to 45% by weight hexahydroazepine, 5 to 40% by weight ammonia, 9 to 92% by weight water, and 1 to 10% by weight based on the weight of hexahydroazepine of impurities selected from the group consisting of hexamethylenediamine, hexylamine, piperidine, pyrrolidine, N-methylpyrrolidine and their mixtures by the steps of:
(1) stripping off ammonia by distillation;
(2) distilling overhead a 50/50 azeotrope of hexahydroazepine and water;
(3) condensing the overhead stream;
(4) separating the condensate into two phases one of which is rich in hexahydroazepine, by heating to a temperature of about 90 to 95° C.;
(5) removing the hexahydroazepine rich phase;

(6) distilling off a 50/50 azeotrope of hexahydroazepine and water from the hexahydroazepine rich phase leaving behind substantially 100% pure hexahydroazepine.

3,272,725
METHOD OF ELECTROLYTICALLY TESTING OXYGEN CONCENTRATION
Arthur W. Garst, Tulsa, Okla., assignor to Pan American Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Filed May 8, 1963, Ser. No. 278,965
5 Claims. (Cl. 204—1)



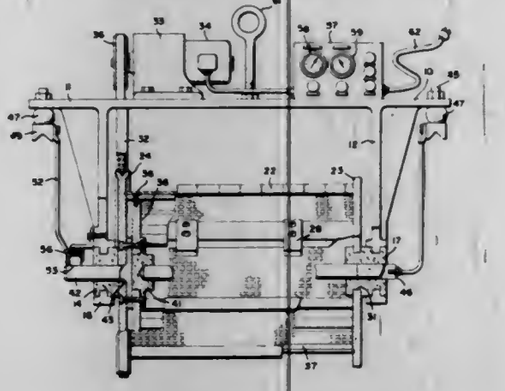
1. In a method for measuring the oxygen concentration in a fluid in which method a sensing electrode is exposed to said fluid and the electrical current between said sensing electrode and a reference electrode is measured as an indication of oxygen concentration in said fluid, the improvement comprising:
employing as said sensing electrode a metal in an electrolyte surrounded by a membrane permeable to oxygen, said electrolyte being an alkaline aqueous solution of ammonium chloride and said metal being inert to said electrolyte,
and employing as said reference electrode carbon in an electrolyte which is an aqueous solution of a sulfur-containing salt selected from the group consisting of alkali metal thiosulfates and alkali metal sulfites.

3,272,726
PRODUCTION OF URANIUM
Allan Robert Gibson, Harwell, and Ronald George Avery, Oxford, England, assignors to United Kingdom Atomic Energy Authority, London, England
Filed May 3, 1963, Ser. No. 277,894
Claims priority, application Great Britain, May 10, 1962, 18,109/62
13 Claims. (Cl. 204—1.5)

1. A method for the production of a uranium containing material selected from the group consisting of uranium metal and alloys of uranium comprising the steps of suspending particles of uranium dioxide in an electrolyte consisting essentially of a molten alkaline earth metal chloride, effecting electrolysis in an electrolysis cell containing an anode and a metal cathode which are both unreactive with respect to the molten chloride, and maintaining the temperature of the molten chloride below the melting point of uranium.

3,272,727
PROCESS FOR ELECTROPLATING MAGNETIC ALLOY ONTO A PLATINIZED CHROMIUM SUBSTRATE
Arnold F. Schmeckenbecher, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 23, 1962, Ser. No. 218,875
5 Claims. (Cl. 204—29)

1. A method of fabricating bistable magnetic films having high speed magnetic switching characteristics comprising:
treating a chromium substrate layer with a solution containing from 0.001 to 10 percent by weight of chloroplatinic acid for a time of less than about 30 minutes to produce a thin film of platinum over said substrate layer;
and electroplating a magnetic nickel-iron alloy film having a thickness of thousands of Angstrom units over said chromium layer while applying a uniaxial orienting magnetic field at the surface of said chromium layer.



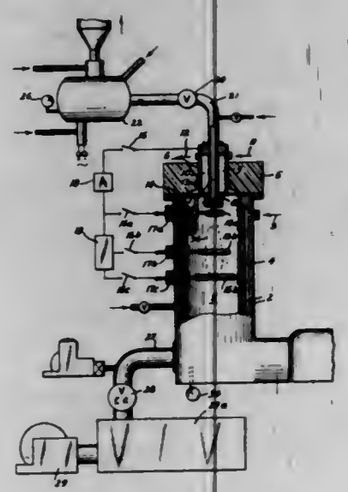
3,272,728
METHOD OF PRODUCING ACTIVATED ELECTRODES
Axel Hahndorff, Berlin-Siemensstadt, and Günther Barthel, Berlin-Grunewald, Germany, assignors to Pintsch Bamag Aktiengesellschaft, Berlin, Germany
No Drawing. Filed Oct. 3, 1961, Ser. No. 142,532
Claims priority, application Germany, Oct. 7, 1960, P 25,800
5 Claims. (Cl. 204—35)

1. In a method of producing electrodes for use in electrolytic cells, the steps of galvanically applying to at least a portion of the surface of a metallic electrode core as a metallic surface layer an alloy consisting essentially of a first component capable of reducing over-voltage at said electrode, and of a further component adapted to be at least partially dissolved so as to activate said surface layer by such at least partial dissolution of said second component; and dissolving at least a portion of said second component substantially without affecting said first component, thereby activating the thus applied metallic surface layer.

3,272,729
METHOD OF ELECTROPOLISHING SMALL METAL OBJECTS
John F. Jumer, 16 W. 131 Timber Trails Drive, Elmhurst, Ill.
Filed Apr. 10, 1963, Ser. No. 272,043
4 Claims. (Cl. 204—140.5)

1. The method of enhancing the uniformity of lustre of small metal objects capable of being electropolished in an electrolytic bath which includes the steps of arranging a plurality of said objects in contact with each other in a relatively thin generally rectangular zone in an elec-

tropolishing electrolytic bath, maintaining said objects motionless while passing electrical current from said parts to a cathode spaced from said zone, thereby forming a gas film on the surfaces of the parts exposed directly to said cathode, maintaining said objects motionless until said gas film consists of a multiplicity of bubbles of ir-



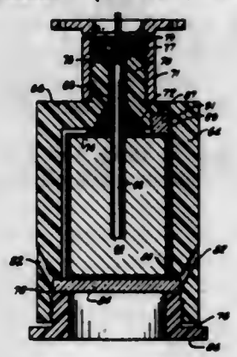
regular size, then destroying said film by tumbling said objects within said zone and thereby exposing a substantially bubble free surface to the cathode, and periodically repeating said steps of holding said objects motionless and tumbling said objects to destroy a film of bubbles of irregular size while continuing the passage of electrical current between the parts and the cathode.

3,272,730

PROCESS OF PREPARING HYDRAZINE-AMMONIA ADDITION COMPOUNDS

Bernhard Berghaus, Zurich, and Maria Staesche, Wettingen, Aargau, Switzerland, assignors to Elektrophysikalische Anstalt Bernhard Berghaus, Vaduz, Liechtenstein, a corporation of Liechtenstein

Filed Aug. 24, 1964, Ser. No. 391,387
13 Claims. (Cl. 204—177)



1. A process for the production of addition compounds of hydrazine and ammonia comprising subjecting a gas selected from the group consisting of (1) ammonia and (2) at least two gases of the group consisting of ammonia gas, nitrogen and hydrogen to an electric glow discharge in the form of a jet discharge to form a reaction mixture containing addition compounds of hydrazine and ammonia and removing the formed reaction mixture rapidly from said discharge zone.

3,272,731

EROSION RESISTANT REFERENCE ELECTRODE ASSEMBLY

Merle Hutchison and William P. Banks, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

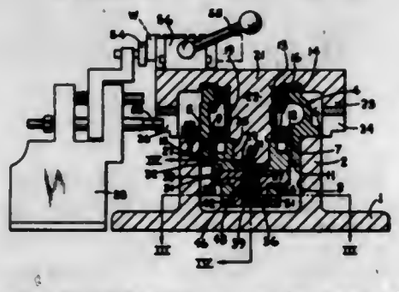
Filed Feb. 25, 1963, Ser. No. 260,703
10 Claims. (Cl. 204—195)

1. A shield for protecting a reference electrode from the erosive influence of an agitated liquid in which said electrode is immersed comprising:

(a) a reference electrode;

(b) a tubular container dimensioned to closely surround said electrode and having an open lower end and a closed upper end, said closed upper end having an aperture therein facilitating passage therethrough of an electrical lead connected to said electrode;

(c) a liquid permeable member sealingly positioned across the open lower end of said tubular container for supporting the reference electrode in said tubular container; and



(d) passage means extending outwardly through the wall of said tubular container and only communicating with the periphery of said liquid permeable member to permit gas to escape from said permeable member when said electrode is in operational position.

3,272,732

WORK HOLDING DEVICE

Richard R. Faulkner, Kalamazoo Township, Kalamazoo County, Mich., assignor to Hammond Machinery Builders, Inc., Kalamazoo, Mich., a corporation of Michigan

Filed Dec. 13, 1961, Ser. No. 158,961
8 Claims. (Cl. 204—297)

1. In a working holding device for use with electroerosion apparatus, the combination comprising:

a generally circular table having a depending peripheral skirt and a plurality of notches in said skirt;

a central post supporting said table;

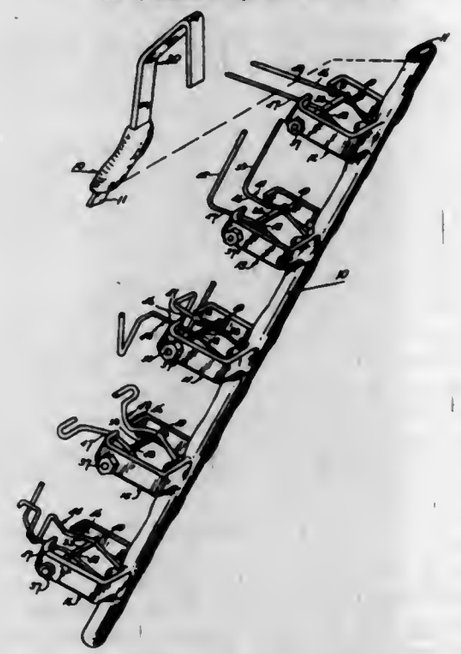
a base having a hollow boss upstanding therefrom and means supported at the upper end of said hollow boss for rotatably engaging and supporting said table;

a generally cup-shaped, upwardly opening upper brush plate snugly embracing and fixed to the lower end of said post and having a substantially planar, lower electrical transfer surface arranged substantially perpendicularly to the axis of said post, said lower surface being located below and underlying the lower end of said post and being of an area greater than the area of the lower end of said post;

a bus bar affixed rigidly with respect to said base and having an opening therethrough;

a lower brush plate having a stem portion extending through said opening and arranged in non-rotatable relationship with respect thereto, said lower brush plate having at its upper end a substantially planar electrical transfer surface, said last-named surface being similar in size and shape, and being in contact with, said first-named electrical transfer surface;

means resiliently urging said lower brush plate against said upper brush plate for urging said electrical transfer surfaces resiliently together;



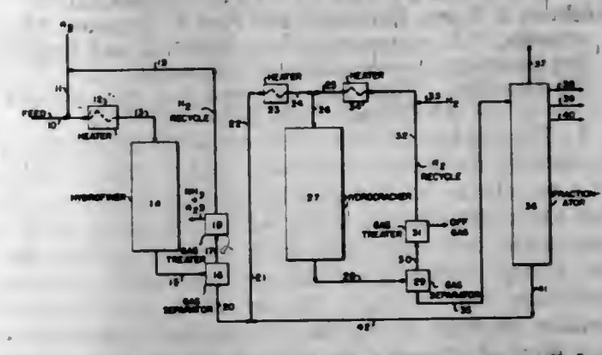
whereby the only respectively movable surfaces through which electrical current is transferred from one body to another are of large area and capable of a conforming in a snug area contact with respect to each other.

3,272,733

ELECTROPLATING RACKS

William E. Belke, Chicago, Ill.; Lester L. Linquist and Ralph E. Belke, executors of said William E. Belke, deceased, assignors to Belke Manufacturing Company, Chicago, Ill., a corporation of Illinois

Filed Apr. 15, 1963, Ser. No. 272,891
13 Claims. (Cl. 204—297)



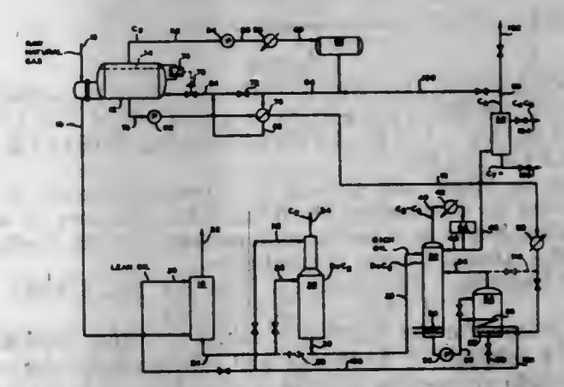
1. An electroplating rack assembly comprising a rack spine having a bare hook at its upper end and having an elongated vertical depending body provided on one side with an outwardly projecting U-shaped stirrup, said stirrup having a pair of forwardly projecting flanges, joined by a yoke, said yoke being secured to the front of said spine with its flanges extending horizontally from the vertical body, said yoke being secured to said spine by a pair of headed members extending through the yoke and spine and having the heads of said bevelled members located on the inner side of the yoke between the flanges thereof, said flanges being turned inward toward each other and having an upwardly bevelled end surface, the said spine and its attachments being covered overall with an initially plastic insulating compound, except at the upper bare hook, the said stirrup having its flanges provided with a pair of aligned bores exposing bare metal in said bores and the bores receiving an electrically conducting threaded bolt, and a quickly attachable finger unit adapted to support and conduct current between the spine and articles to be electroplated, comprising a resilient bendable wire having a U-shaped body with a pair of legs projecting outwardly from a joining yoke, said yoke being engaged below the shoulders formed by said heads and the legs passing over the said bolt and the said legs being sprung together manually and pressed downward until the legs are located below said upwardly bevelled end surface on each flange, the legs springing outwardly under the bevelled end surfaces and pressing against the ends of the flanges to be retained on the spine in good electrical conduction therewith.

3,272,734

HYDROFINING AND HYDROCRACKING PROCESS

Donald D. MacLaren, Plainfield, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Filed Aug. 23, 1963, Ser. No. 304,163
13 Claims. (Cl. 208—110)



1. A process for hydrocracking a hydrocarbon oil feed having a nitrogen content within the range of about 28 to about 200 parts per million comprising contacting said feed in the presence of hydrogen with a hydrocracking catalyst comprising a crystalline alumino-silicate zeolite composited with a platinum group metal, said zeolite having pore openings of about 6 to about 15 Angstrom units and containing less than about 10 wt. percent alkali metal oxide, at hydrocracking conditions sufficient to obtain the desired conversion to lower boiling product.

3,272,735

OIL REMOVAL FROM LIQUID REFRIGERANT

Julius E. Schneider, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Filed Feb. 3, 1964, Ser. No. 342,151
9 Claims. (Cl. 208—341)

1. A process for recovering gasoline boiling range hydrocarbons from natural gas comprising the steps:

(1) cooling a raw natural gas stream in an indirect heat exchanger with liquid propane as a refrigerant wherein propane is vaporized, compressed, cooled, and pumped back into the heat exchanger with a

minor amount of oil impurities picked up from the equipment;

(2) contacting the cooled natural gas from step (1) with lean oil absorbent to recover a rich oil stream containing hydrocarbons in the gasoline boiling range and C_2 and C_3 hydrocarbons in minor proportions;

(3) passing the rich oil from step (2) to a dehexanizer and recovering C_6 and lighter hydrocarbons as an overhead stream and hot lean oil as a bottoms stream; and

(4) withdrawing a minor stream of liquid propane containing oil impurities from the bottom of the heat exchanger of step (1), heating same, and passing the heated propane in vapor form into the dehexanizer of step (3) to separate said oil impurities therefrom and recover the propane in the overhead hydrocarbons.

3,272,736

METHOD OF PREVENTING CORROSION

Anthony J. Petro, Elizabeth, and Paul E. Krystow, Mountainside, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed July 23, 1964, Ser. No. 384,804
15 Claims. (Cl. 208—348)

1. The process of claim 1 wherein the distillation is a in metallic distillation equipment used for the distillation of a petroleum fraction said fraction containing an alkaline earth chloride and water which comprises admixing ammonium carbonate and a base, said base selected from the group consisting of sodium hydroxide, potassium hydroxide and mixtures thereof, with said petroleum fraction prior to raising the temperature of said fraction to a level of at least about 200° F. and thereby avoiding hydrolysis of the alkaline earth chlorides and thereafter distilling said petroleum fraction.

3,272,737

SEPARATION OF ACIDS BY DIALYSIS WITH ANION-EXCHANGE MEMBRANES

Robert D. Hansen and Robert M. Wheaton, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Nov. 2, 1964, Ser. No. 408,381
6 Claims. (Cl. 210—22)

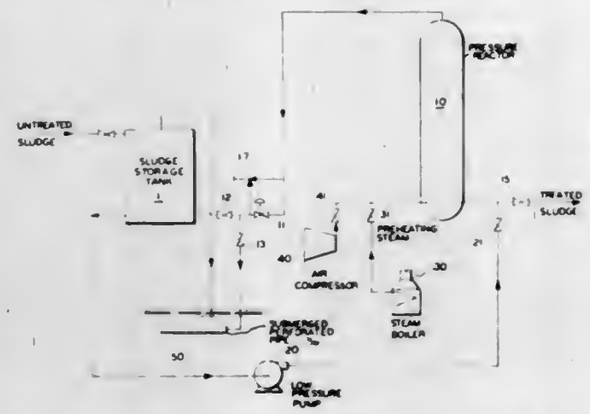
1. In a dialysis process for separating low molecular weight acids in aqueous solution, the improvement which comprises using an anion-exchange membrane as the dialysis membrane to separate a strong acid having an ionization constant less than 1.0×10^{-3} from a weak acid having an ionization constant greater than 1.0×10^{-3}.

3,272,738

PROCESS FOR THE REMOVAL OF METAL CORROSION PRODUCTS FROM A SOLUTION OF HYDRAZINE AND ETHYLENEDIAMINETETRAACETIC ACID

Edgar C. Pitzer and George R. Fountain, Scotia, and Joseph R. Ciaranello, De Witt, N.Y., assignors to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Filed June 17, 1964, Ser. No. 375,983
1 Claim. (Cl. 210—51)



A process for the removal of metal corrosion products from a solution of hydrazine and ethylenediaminetetraacetic acid comprising acidifying a solution of hydrazine and ethylenediaminetetraacetic acid containing corrosion products from the group consisting of iron, nickel, cobalt, and manganese to a pH in the range of 1.0 to 1.5 by the addition of sulfuric acid, adding a solution of potassium ferrocyanide in an excess of 10 mole percent of the stoichiometric amount of said corrosion products to said hydrazine and ethylenediaminetetraacetic acid solution whereupon a precipitate is formed, centrifuging the precipitate containing solution and separating the clear hydrazine and ethylenediaminetetraacetic acid solution from the precipitate.

3,272,739

SEWAGE TREATMENT PROCESS

John S. Earle, Ringle, Eugene W. Schoeffel, Mosinee, and Frederick J. Zimmermann, Wausau, Wis., assignors to Sterling Drug, Inc., New York, N.Y., a corporation of Delaware

Filed Nov. 13, 1964, Ser. No. 410,962
9 Claims. (Cl. 210—63)

1. A cyclic process for treating sewage sludge to reduce its specific resistance to filtration and the moisture-holding capacity of the insoluble solids thereof which comprises the successive steps of

(a) heating a portion of sludge pre-heated as in step (e) under pressure in a heating zone insulated against heat loss and adapted to pressurized operation to a selected temperature between 100–225° C. by direct contact with a stream of a hot gas;

(b) discontinuing heating of the sludge;

(c) maintaining the heated sludge under pressure in the heated zone for at least one hour at a temperature above 100° C. while passing gaseous oxygen through the heated sludge during at least the terminal portion of the time during which the sludge is maintained under pressure in the heated zone until the specific resistance to filtration of the sludge in $sec.^2/g.\times10^7$ is reduced to less than 250;

(d) reducing at least partially the pressure in the heating zone,

(e) venting at least a portion of the hot gases thus released through a second portion of sewage sludge, thereby directly heating the second portion of sludge;

(f) discharging the portion of sludge from the pressurized heating zone;

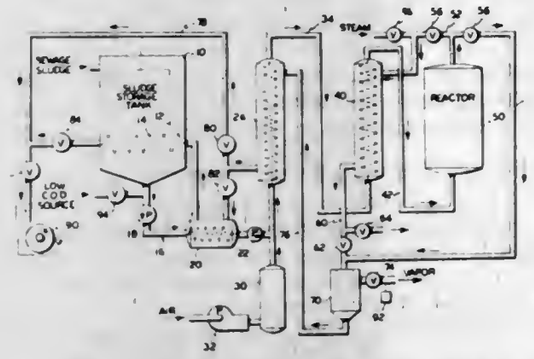
(g) repeating steps (b) through (f) with the second portion of pre-heated sludge.

3,272,740

SEWAGE SLUDGE TREATMENT PROCESS

Wayne B. Gitchel and Clarence A. Hoffman, Rothschild, and Eugene W. Schoeffel, Kronenwetter, Wis., assignors to Sterling Drug, Inc., New York, N.Y., a corporation of Delaware

Filed June 24, 1964, Ser. No. 377,694
3 Claims. (Cl. 210—63)



1. A continuous process for producing from sewage sludge innocuous, substantially odor-free, cured organic sludge having optimum processing characteristics which comprises the steps of

(a) continuously mixing a substantially constant volume of sewage sludge with a substantially constant volume of air in a selected proportion which supplies

to the mixture an amount of gaseous oxygen capable of reducing by more than 5 percent the C.O.D. of the sludge by oxidation, to produce a mixture having a gaseous and a liquid phase;

(b) continuously heating a stream of the resultant mixture to a temperature above about 170° C. under conditions capable of consuming all the oxygen in the mixture;

(c) heating the mixture for a period of time which reduces the C.O.D. of the sludge by between 5 percent and 45 percent and which maintains between about 0.5 percent and 6.5 percent gaseous oxygen content in the gaseous phase of the oxidized mixture, thereby

producing a cured innocuous fibrous sludge having lower specific resistance to filtration and a higher settling rate and whose insoluble solids have lower water holding capacity, compared with the starting sludge;

(d) continuously separating the gaseous phase from the liquid phase of the oxidized mixture; and

(e) maintaining substantially constant the amount of gaseous oxygen consumed by adjusting the temperature to which the mixture is heated in a manner which is directly proportional to variations from the average in the gaseous oxygen content of the gaseous phase obtained from the oxidation, thereby maintaining the sludge at all times in the presence of gaseous oxygen during the wet air oxidation.

3,272,741

WELL COMPLETION OR WORKOVER FLUID

John S. Brukner, Houston, and Charles C. Nathan, Bellaire, Tex., assignors to Texaco Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 29, 1962, Ser. No. 183,361
11 Claims. (Cl. 252—8.55)

1. A heat stable well completion or workover fluid consisting essentially of an aqueous brine solution having dissolved therein a compatible water soluble inorganic compound selected from the group consisting of a water soluble, chromate, a water soluble polychromate and mixtures thereof, said compound being present in an amount of at least about 15 percent by weight of the solution and to provide a fluid having a density between about 9 and 21 lbs. per gallon.

3,272,742

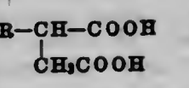
COATED ADSORBENTS AS TREATING AGENTS FOR MINERAL OILS

Arthur T. Polishuk, Media, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed June 25, 1963, Ser. No. 290,344
8 Claims. (Cl. 252—28)

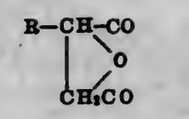
1. In the treatment of a body of mineral oil with a solid adsorbent to remove water which body of mineral oil contains an additive that would normally be removed by said solid adsorbent during said treatment, the improvement which comprises completely coating said solid adsorbent with a hydroscopic, water-soluble, mineral oil-insoluble material and utilizing the coated solid adsorbent in said system as said solid adsorbent.

3,272,743



LUBRICANTS CONTAINING METAL-FREE DISPERSANTS AND METALLIC DISPERSANTS

George R. Norman, Lyndhurst, and William M. Le Suer, Cleveland, Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio



No Drawing. Filed Aug. 5, 1964, Ser. No. 387,757
12 Claims. (Cl. 252—32.5)

1. A lubricating composition consisting essentially of a major proportion of a lubricating oil and

(a) from about 0.1 to about 10 percent by weight of an oil-soluble acylated amine prepared by the process which comprises mixing one equivalent of a substituted succinic compound selected from the class consisting of substituted succinic acids having the structural formula

and substituted succinic anhydrides having the structural formula

in which structural formulas R is a radical selected from the class consisting of large aliphatic hydrocarbon radicals having at least about 50 carbon atoms with at least about one-half an equivalent amount of an alkylene polyamine, and heating the resulting mixture, at a temperature above about 80° C. to effect acylation and remove the water formed thereby, and

(b) from about 0.05 to about 5.0 percent by weight as sulfate ash of an oil-soluble dispersant selected from the class consisting of alkaline earth metal petroleum sulfonates, alkaline earth metal alkyl-aromatic sulfonates, alkaline earth metal alkyl phenates and alkaline earth metal salts of phosphorus acids prepared from polymers of olefins having 2–30 carbon atoms said polymer having a molecular weight of at least about 750.

3,272,744

LUBRICANTS CONTAINING ALKYLENE OXIDE REACTION PRODUCTS

Elmer E. Schallenberg, Fishkill, and Roger G. Lacoste, Hopewell Junction, N.Y., and Herman D. Kluge, deceased, late of Fishkill, N.Y., by Hazel E. Kluge, administratrix, Fishkill, N.Y., assignors to Texaco Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 27, 1964, Ser. No. 407,285
15 Claims. (Cl. 252—32.7)

15. A lubricating composition comprising a lubricating oil as the major component, 0.2–10.0 weight percent of an additive selected from the group consisting of monohydroxyalkyl hydrocarbyl thiophosphonate and a mixture of said thiophosphonate and the corresponding monohydroxyalkyl hydrocarbyl phosphonate, said monohydroxyalkyl hydrocarbyl thiophosphonate having the general formula:

wherein R is a monovalent hydrocarbyl radical containing at least 12 carbon atoms, R' and R'' are selected from the group consisting of hydrogen and monovalent aliphatic hydrocarbyl radicals containing 1–6 carbon atoms, and X is sulfur, an alkaline earth metal alkyl phenolate in a concentration between 0.1 and 5.0 weight percent, and a divalent metal alkyl dithiophosphate in a concentration between 0.1 and 3.0 weight percent, said mixture consisting of a major portion of said thiophosphonate and a minor portion of said phosphonate where X is oxygen.

3,272,745

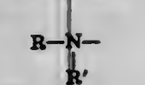
GREASE COMPOSITION

James G. Dadura, Beacon, Norman R. Odell, Wappingers Falls, N.Y., and Paul A. Cantor, Covina, Calif., assignors to Texaco, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Dec. 27, 1962, Ser. No. 247,549
7 Claims. (Cl. 252—33.6)

1. A grease composition comprising 51 to 90% by weight of a benzyl C_8–C_{10} branched chain azelate base oil thickened to a grease consistency with 10 to 49% by weight of a sodium salt of an acid selected from the group consisting of N-acyl p-aminobenzoic acid and N-acyl phthalamic acid, said acyl group containing from about 14 to 22 carbon atoms.

3,272,746



LUBRICATING COMPOSITION CONTAINING AN ACYLATED NITROGEN COMPOUND

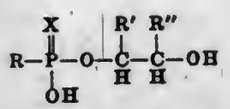
William M. Le Suer, Cleveland, and George R. Norman, Lyndhurst, Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Nov. 22, 1965, Ser. No. 509,172
18 Claims. (Cl. 252—47.5)

1. A composition comprising a major proportion of a lubricating oil and a minor proportion sufficient to impart detergency thereto of an oil-soluble acylated nitrogen compound characterized by the presence within its structure of (A) a substantially saturated hydrocarbon-substituted polar group selected from the class consisting of acyl, acylimidoyl, and acyloxy radicals wherein the substantially saturated hydrocarbon substituent contains at least about 50 aliphatic carbon atoms and (B) a nitrogen-containing group characterized by a nitrogen atom attached directly to said polar radical.

5. The composition of claim 1 wherein the nitrogen-containing group has the formula

wherein R and R' are selected from the group consisting of hydrogen, hydrocarbon, amino-substituted hydrocarbon, hydroxy-substituted hydrocarbon, alkoxy-substituted hydrocarbon, amino, carbamyl, thiocarbamyl, guanyl, and acylimidoyl radicals.



3,272,747

FIRE RESISTANT HYDRAULIC FLUID

William T. Shepherd, Port Arthur, Tex., assignor to Texaco Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed June 12, 1963, Ser. No. 287,213
6 Claims. (Cl. 252—78)

1. A fire resistant water-in-oil emulsion suitable for use as a hydraulic fluid comprising from 60 to 40 volume percent of water and from 40 to 60 volume percent of an oleaginous blend containing a major portion of a mineral oil having a viscosity in the range from 50 to 300 SUS at 100° F., from 1 to 12 volume percent of a lipophilic emulsifying agent selected from the group consisting of a fatty acid partial ester of a 6 carbon polyhydric alcohol mono- and di-anhydride and mixtures thereof, 5 to 20 volume percent of a hydrophilic emulsifying agent based on said lipophilic emulsifying agent comprising an ethylene oxide C_{4-24} alkylphenol adduct in mode ratios of from 10:1 to 40:1, 0.05 to 2.5 volume percent of a concentrate of a mono-(hydroxyalkyl) hydrocarbyl thiophosphonate having the formula:

wherein R is a polyolefin radical having a molecular weight in the range from 250 to 50,000, R' and R'' are selected from the group consisting of hydrogen and a monovalent aliphatic hydrocarbyl radical having from 1 to 6 carbon atoms and X is selected from the group consisting of sulfur and a mixture of sulfur and oxygen, and a volatile corrosion inhibitor in an amount sufficient to inhibit corrosion in the liquid and vapor phases.

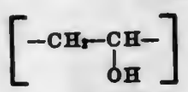
3,272,748

ETCHING OF SILICON AND GERMANIUM

Alfons H. Szkudlapski, Bethlehem, Pa., assignor to Western Electric Company Incorporated, New York, N.Y., a corporation of New York

No Drawing. Filed June 29, 1964, Ser. No. 379,015
10 Claims. (Cl. 252—79.3)

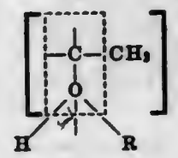
1. The method of etching a surface of a semiconductive material selected from the group consisting of silicon and germanium, which comprises treating the surface with a solution containing nitric acid, hydrofluoric acid and iodine monobromide, the amount of iodine monobromide in said solution ranging from more than a trace to saturation.



3,272,749

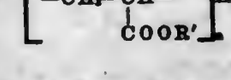
DRILLING MUD AND ADDITIVE THEREFOR

Robert A. Martin, Charleston, W. Va., assignor to Alco Chemical Corporation, Philadelphia, Pa., a corporation of Ohio



No Drawing. Filed Mar. 31, 1965, Ser. No. 444,433
11 Claims. (Cl. 252—8.5)

1. An improved aqueous drilling fluid comprising water, particulate solid material which forms a filter cake on the wall of a well, and a water-soluble graft polymer comprising a linear chain of vinyl alcohol units of the formula:



I

and reoccurring units of the formula:

II

in which R is the side chain graft polymerized onto said linear chain and is a radical having the formula

III

wherein R' is selected from the group consisting of Na, K, Li, NH_4, $R''NH_3$, R''_2NH_2, R''_3NH and R''_4N, and R'' is an alkyl group containing from 1 to 4 carbon atoms;

n is a positive integer from 25 to 1200, the ratio of the number of vinyl alcohol groups of Formula I to the number of groups of Formula II is in the range between 30:1 and 200:1, and the total number of vinyl alcohol groups of Formula I is in the range between 800 and 20,000; said polymer being present in an amount sufficient to reduce water loss through the filter cake without increasing the viscosity of said drilling fluid to prevent circulation thereof at elevated temperatures on the order of 350° F.

3,272,750

PROCESS AND COMPOSITION CONTAINING AN OXYGEN RELEASING COMPOUND AND AN ORGANIC CARBONATE

Basil Hugh Chase, Heswall, England, assignor to Lever Brothers Company, New York, N.Y., a corporation of Maine

No Drawing. Filed May 3, 1963, Ser. No. 277,721
Claims priority, application Great Britain, May 7, 1962, 17,379/62
11 Claims. (Cl. 252—99)

4. A composition for use in bleaching textile material consisting essentially of an inorganic per-salt selected from the group consisting of the alkali metal perborates, percarbonates, perpyrophosphates, and persilicates, and an ester selected from the class consisting of (a) esters of carbonic acid having the formula $R_1—O—CO—O—R_2$ wherein each of R_1 and R_2 is an organic radical, R_1 exerting an electron-attracting effect, and (b) diethyl pyrocarbonate, said esters having a titer in the per-acid formation test of not less than 1.0 ml. of 0.1 N $Na_2S_2O_3$, the hydrogen peroxide and ester being present in amounts sufficient to provide from about ¼ to about 2 molecules of ester per atom of available oxygen.

3,272,751

CLEANING AGENTS CONTAINING CYCLIC IMIDE ADDITION PRODUCTS

William J. Shibe, Jr., Riverton, N.J., and Marcus Sittenfield, Philadelphia, Pa., assignors to Hollichem Corporation, Camden, N.J., a corporation of New Jersey

No Drawing. Original application Mar. 20, 1962, Ser. No. 181,204, now Patent No. 3,223,711, dated Dec. 14, 1965. Divided and this application Aug. 18, 1965, Ser. No. 480,755
4 Claims. (Cl. 252—106)

1. A detergent composition consisting essentially of a a member of the group consisting of benzosulfimide, cleaning agent in an amount sufficient to effect a cleaning action, said cleaning agent being selected from the group consisting of soap and non-soap organic anionic detergents, in admixture with a biocidally effective amount of a product of the reaction of a haloamine and an aromatic cyclic imide wherein the halo-amine has the formula:

$$(R_2N)_nEX_{m-n}\cdot(n-1)X$$

where m is an integer from 3 to 4 and n is an integer from 1 to 4 when m is 4 and is an integer from 1 to 3 when m is 3, where at least one R attached to each nitrogen atom is attached thereto by means of a terminal carbon atom and is selected from the group consisting of alkyl, alkenyl, alkadienyl, hydroxyalkyl and alkyl benzyl, the straight chains of which have from 4 to 22 carbon atoms, and lower polyoxyalkylene having a total of 4 to 22 carbon atoms, any remaining R's being selected from the group consisting of hydrogen, alkyl radicals having from 1 to 5 carbon atoms, phenyl and benzyl, where E is selected from the group consisting of zinc, copper, cobalt, magnesium, manganese, aluminum, boron phthalimide, naphthalimide, benzoxazoline, benzothiazo- and iron, and where X is a halide, the cyclic imide being linone, and their lower alkyl, halo and methoxy analogs.

3,272,752

METHOD OF PRODUCING DETERGENTS

Gerhard Hartlapp, Knapsack, near Cologne, and Waldemar Bielenberg, Cologne-Klettenberg, Germany, assignors to Knapsack-Griesheim Aktiengesellschaft, Knapsack, near Cologne, Germany, a corporation of Germany

No Drawing. Filed Mar. 6, 1962, Ser. No. 177,759
Claims priority, application Germany, Mar. 7, 1961, K 43,106
6 Claims. (Cl. 252—135)

1. In the method of producing detergent compositions consisting essentially of alkali metal triphosphates selected from the group consisting of sodium tripolyphosphate and potassium tripolyphosphates, and other conventional detergent components from an aqueous slurry containing the alkali metal triphosphates and at least a part of said other detergent components, the improvement which comprises adding to the slurry 0.1 to 2.0% by weight of a calcium salt which ionizes substantially complete in the slurry, the amount of the calcium salt being calculated on the amount of alkali metal triphosphate present in the slurry, and spray-drying the resulting mixture.

3,272,753

DETERGENT LIQUID

Harold Eugene Wixon, New Brunswick, N.J., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Jan. 13, 1965, Ser. No. 425,331
9 Claims. (Cl. 252—137)

2. A liquid detergent composition substantially free from inorganic polyphosphate salts consisting essentially of about 7 to 22% by weight of alkali metal alkyl benzene sulfonate detergent having an alkyl group of 8 to 15 carbon atoms, about 12 to 20% by weight of sodium silicate solids having a sodium oxide to silica ratio from about 1:1 to 1:2, effective as an inorganic builder salt sufficient to exhibit heavy-duty detergency in combination therewith in the absence of said polyphosphates, about 5 to 12% by weight of an alkali metal organic hydrotropic salt selected from the group consisting of sodium and potassium xylene and toluene sulfonates, and the balance being primarily water, said detergent composition forming a pourable, homogeneous liquid composition having a total solids content up to about 52% by weight and a pH of at least about 11.

4. A liquid detergent composition in accordance with claim 2 which contains about 3 to 6% by weight of a higher fatty acid alkylolamide having 8 to 18 carbons in the acyl radical and 2 to 3 carbons in each alkylol group.

3,272,754

DRY CLEANING AGENTS FOR TEXTILE MATERIALS

Gaston Jaccard, Basel, Switzerland, assignor to Sandoz Ltd., Basel, Switzerland

No Drawing. Filed July 9, 1962, Ser. No. 208,627
Claims priority, application Switzerland, Aug. 8, 1961, 9,300/61; Aug. 18, 1961, 9,675/61; Apr. 26, 1962, 5,030/62
18 Claims. (Cl. 252—161)

1. A dry cleaning solution with enhanced water absorbing capacity consisting essentially of a chlorinated hydrocarbon dry cleaning solvent having dissolved therein at least 0.25 grams per liter of said solvent of a mixture consisting of (a) an alkaline earth metal salt selected from the group consisting of calcium and magnesium of alkylarylsulfonic acid selected from the group consisting of alkylbenzene sulfonic acid and alkylnaphthalene sulfonic acid and (b) a surface active polyglycol ether wherein the lipophilic portion has from 12 to 18 carbon atoms and the hydrophilic portion has about 7 to 15 CH_2CH_2O— groups; the ratio of (a) to (b) being 1:2 to 2:1 by weight.

3,272,755

COMPOSITIONS OF POLYMERIC N-VINYL-ORGANIC COMPOUNDS AND PERCHLORIC ACID

Dimitry A. Shiraeff, Kutztown, Pa., assignor to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 10, 1963, Ser. No. 315,338
8 Claims. (Cl. 252—187)

1. A stable aqueous gel of perchloric acid consisting essentially of perchloric acid of at least about 30% concentration in combination with a polymeric N-vinyl heterocyclic compound selected from the group consisting of polymers of N-vinyl lactams, polymeric N-vinyl oxazolidones, polymeric N-vinyl imidazoles, polymeric N-vinyl morpholones and copolymers thereof with dissimilar vinyl monomers, said polymeric N-vinyl heterocyclic compound constituting from 45 to 55% by weight of said gel.

3,272,756

RADIOACTIVE WASTE DISPOSAL USING COLEMANITE

John D. Kaser, Richland, Wash., assignor to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Filed Aug. 31, 1965, Ser. No. 484,136
2 Claims. (Cl. 252—301.1)

1. A process for treating waste liquids resulting from the chemical reprocessing of irradiated nuclear fuel which comprises:

(a) adding finely divided colemanite to said waste liquid, thereby forming a slurry;

(b) subjecting said slurry to spray calcination at a wall temperature in the range 600° C. to 750° C., thereby forming a finely divided solid residue and waste gases; and

(c) separating said solid residue from said gases;

the amount of colemanite being sufficient to form with the calcined constituents of said waste, a product having a melting point of less than 1000° C.

3,272,757

PROCESS OF BREAKING REVERSED EMULSIONS

Willard H. Kirkpatrick, Sugar Land, and Virgil L. Seale, Houston, Tex., assignors to Nalco Chemical Company, Chicago, Ill., a corporation of Delaware

No Drawing. Original application Jan. 7, 1963, Ser. No. 249,617. Divided and this application Aug. 3, 1964, Ser. No. 387,185
11 Claims. (Cl. 252—344)

1. A process for breaking an oil-in-water emulsion which comprises mixing with said emulsion a polycondensate selected from the group consisting of (*a*) a polycondensate having a molecular weight of at least 1000 of epichlorohydrin and a polyalkylene polyamine of the formula $H_2N(R—NH)_{2-9}H$ wherein R is selected from the group consisting of ethylene, propylene-1,2 and propylene-1,3, (*b*) a polycondensate having a molecular weight of at least 1000 of epichlorohydrin and a precondensate of a polyalkylene polyamine of the formula $H_2N(R—NH)_{2-9}H$ wherein R is as aforedefined and a polyoxyalkylene glycol wherein the oxyalkylene groups are selected from the group consisting of solely oxyethylene groups, both oxyethylene and oxypropylene groups, and both oxyethylene and oxybutylene groups, (*c*) a polycondensate having a molecular weight of at least 1000 of epichlorohydrin, a polyalkylene polyamine of the formula $H_2N(R—NH)_{2-9}H$ wherein R is as aforedefined, and an epichlorohydrin adduct of an aliphatic glycol, and (*d*) a polycondensate having a molecular weight of at least 1000 of a polyalkylene polyamine of the formula

$$H_2N(R—NH)_{2-9}H$$

wherein R is as aforedefined and an epichlorohydrin adduct of a lower alkylene glycol, and resolving the broken emulsion into its water and oil phases.

3,272,758

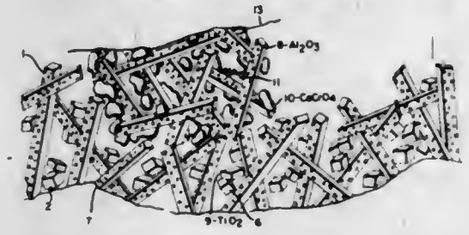
EMULSION FORMING COMPOSITION AND METHOD OF MAKING AND UTILIZING SAME

Earl R. De Lew, Corte Madera, and Arthur Lazar, Palo Alto, Calif., assignors to Yosemite Chemical Co., San Francisco, Calif., a corporation of California

No Drawing. Filed July 18, 1962, Ser. No. 210,817
8 Claims. (Cl. 252—354)

3. A sprayable liquid composition for producing a rapid forming water-in-oil gel in the presence of water, consisting essentially of a divalent metal soap of fatty acids originally present in but separated from wool grease, a sodium petroleum sulfonate surface active agent which increases the affinity of said soap to water, and a liquid petroleum hydrocarbon diluent non-toxic to marine life in which said soap and surface active agent are soluble; the percent by weight of said soap and said diluent in said composition based on the total amount of said soap and said diluent being about as follows:

	Percent by weight
Soap	20 to 45
Diluent	80 to 55



and the amount by weight of said sodium sulfonate surface active agent varying from about 20 to 50% of the weight of said soap.

3,272,759

CATALYST COMPOSITION COMPRISING MANGANO-CHROMIA-MANGANITE AND A CHROMATE

Alvin B. Stiles, Charleston, W. Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed June 9, 1961, Ser. No. 115,970
1 Claim. (Cl. 252—465)

As a catalyst for the treatment of combustion gases which contain such products as nitrogen oxide, carbon monoxide and hydrocarbon and which additionally contain a lead compound; mangano-chromia-manganite containing an interspersant of similar crystallite size selected from the group consisting of oxides of aluminum, titanium, chromium, magnesium, barium, calcium and strontium and supported upon a particulate refractory and being intermixed with discrete particles of a particulate refractory upon which there is supported a chromate selected from the group consisting of alkali metal and alkaline earth metal chromates, the propotrion of chromate to mangano-chromia-manganite in the mixture being in the range of 10:1 to 0.1:1 by weight.

3,272,760

DEHYDROCYCLIZATION CATALYSIS

Louis C. Doelp, Jr., Glen Mills, Pa., assignor to Air Products and Chemicals Inc., Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed Feb. 5, 1963, Ser. No. 256,245
4 Claims. (Cl. 252—465)

1. The method of preparing dehydrocyclization catalyst which comprises mixing alumina trihydrate with a binder, forming said mix into pellets, dehydrating the pellets, impregnating said pellets to incorporate 0.1 to 2% chromium, drying the impregnated pellets, further impregnating the pellets to incorporate 0.2 to 5% of a metal selected from the class consisting of platinum, palladium and mixtures thereof and calcining the pellets.

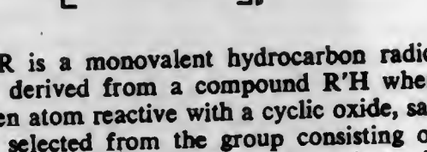
3,272,761

METHOD OF RECLAIMING RUBBER

Harry D. Glenn, Baton Rouge, La., and Walter J. Markiewicz, Watertown, Conn., assignors to United States Rubber Company, New York, N.Y., a corporation of New Jersey

Filed Sept. 27, 1961, Ser. No. 141,025
Claims priority, application Canada, Sept. 1, 1961, 830,989
3 Claims. (Cl. 260—2.3)

1. In the digestion process for reclaiming vulcanized rubber scrap by heating comminuted vulcanized rubber scrap in admixture with a substantial volume of water to produce an aqueous reclaim and thereafter drying the said aqueous reclaim to a milleable condition, the improvement consisting of drying the said aqueous reclaim at a temperature not substantially in excess of 220° F. in a substantially oxygen-free atmosphere.



3,272,762

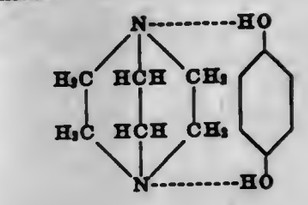
PREPARATION OF CELLULAR POLYURETHANES IN THE PRESENCE OF A SILOXANE-OXYALKYLENE COPOLYMER

Arthur Ibbotson and Edward Jervis Vickers, both of Manchester, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain

No Drawing. Filed Oct. 11, 1961, Ser. No. 144,324
Claims priority, application Great Britain, Oct. 19, 1960, 35,823/60; July 6, 1961, 24,470/61
12 Claims. (Cl. 260—2.5)

1. A process for the manufacture of cellular polyurethane foams by the reaction of a hydroxyl group-containing polymer containing at least two isocyanate-reactive groups per molecule and an organic polyisocyanate in the presence of a blowing agent selected from the group consisting of water, a low boiling point liquid chemically inert to water and isocyanate and having a boiling point not exceeding 75° C. and mixtures thereof, the reaction mixture containing a siloxane-oxyalkylene copolymer of the general formula:

wherein R is a monovalent hydrocarbon radical, R′ is a radical derived from a compound R′H wherein H is a hydrogen atom reactive with a cyclic oxide, said radical R′ being selected from the group consisting of alkoxy, aryloxy, amino, acyloxy and amido, *n* is an integer of 2 to 4, *m* and *p* are positive integers of at least 1, and *y* is selected from positive integers and zero.



3,272,763

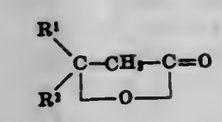
POLYMERIZATION CATALYSIS

William E. Erner, Wilmington, Del., Adalbert Farkas, Media, Pa., and Harold Graboyes, Philadelphia, Pa., assignors to Air Products and Chemicals, Inc., a corporation of Delaware

No Drawing. Original application Feb. 11, 1959, Ser. No. 792,479, now Patent No. 3,037,026, dated May 29, 1962. Divided and this application Nov. 22, 1961, Ser. No. 160,682
2 Claims. (Cl. 260—2.5)

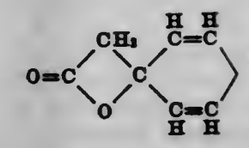
2. The method of preparing a polyurethane plastic which includes the steps of preparing a mixture consisting of about 80 parts by weight of tolylene diisocyanate, about 100 parts of polyhydroxypolyester, about 2 parts of water and about 0.5 part of the hydroquinone molecular addition complex of diazabicyclo-octane corresponding to the formula:

and pouring said mixture into a mold in which the polyurethane foam plastic is cured by the exothermic reaction among the hydroxy and isocyanato groups, which reaction is catalyzed at an increasing rate at the at least partly autogenetically increasing temperatures by such addition complex.



3,272,764

PROCESS FOR PREPARING CELLULAR POLYMERIC PRODUCTS



Max B. Mueller, Morristown, and Theodore Largman, Madison, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

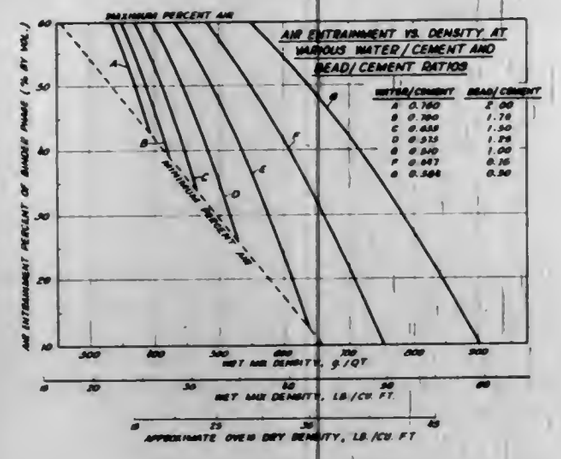
Filed Feb. 21, 1963, Ser. No. 260,222
16 Claims. (Cl. 260—2.5)

1. A process for making plastic foam which comprises heating a normally solid, thermoplastic macromolecular polymeric material having a decomposition temperature above about 200° C. and a softening temperature below about 150° C. in the presence of a small proportion of a beta propiolactone of the forumla

wherein R^1 is selected from the group consisting of hydrogen and lower alkyl, R^2 is a member selected from the group consisting of hydrogen, methyl, phenyl, lower alkene, lower carboxyalkyl and wherein R^1 and R^2 together are

at a temperature effective to decompose the beta-propiolactone to carbon dioxide and a polymerizable monomer, permitting the polymeric material to expand while preventing escape of substantial proportions of carbon dioxide from the polymer mass, and thereafter cooling the polymer mass before a substantial proportion of the thus generated carbon dioxide has escaped from the polymer mass.

3,272,765



LIGHTWEIGHT CONCRETE

Robert C. Sefton, Bridgeville, Pa., assignor to Koppers Company, Inc., a corporation of Delaware

Filed May 18, 1964, Ser. No. 367,932
8 Claims. (Cl. 260—2.5)

1. A low density concrete composition having an oven dry density of 15–35 pounds per cubic foot, which comprises a lightweight aggregate phase of closed celled, multicellular expanded polymeric particles having a density of 1–10 pounds per cubic foot and a binder phase of hydraulic cement and surface active additive wherein the

mix ratio of bag of cement (94 pounds) to cubic feet of polymeric particles is in a range of 1:2 to 1:8 and said

binder phase contains entrained air in an amount of 13.5–60 percent by volume.

3,272,766

GUM SIMULATING ANATOMICAL MOLDING COMPOSITION

Daniel J. Gowman, Strafford, Pa., assignor to Sartomer Resins, Inc., Essington, Pa., a corporation of Delaware

No Drawing. Filed Dec. 3, 1962, Ser. No. 241,558
2 Claims. (Cl. 260—17)

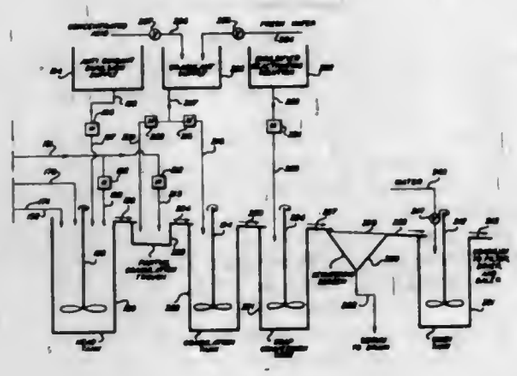
1. A gum-simulating anatomical molding composition having colored vein-simulating fibers incorporated therein which is adapted to be used in the form of moldable resin beads, said composition consisting of a mixture of methyl methacrylate polymer pearls having a particle size of 50 mesh to 320 mesh, 0.05–2.0% by weight thereof of fiber strands from ⅛" to ¾" in length, 2 to 20 denier in weight and consisting essentially of a material selected from the group consisting of vinyl chloride homopolymer, vinyl chloride-acetate copolymer, vinyl chloride-vinyl acetate-carboxylic acid copolymer, polyacrylonitrile, acrylonitrilo-butadiene copolymer, polyethylene terephthalate, polyhexamethylene adipamide, regenerated viscose rayon, cellulose acetate, cellulose acetobutyrate and ethyl cellulose and about 1 part to 20 parts of a liquid polymeric di lower alkyl siloxane per 1,000 parts of said mixture to prevent separation of fibers and pigment during storage and molding, the foregoing mixture of siloxane, strands and methyl methacrylate polymer pearls being formed when molded to bear vein-simulating fibers which simulate the veins in natural gum and mouth tissue.

3,272,767

SYNTHETIC RUBBER LATEX PREPARED USING POLYOXYETHYLATED CASTOR OIL AND ANIONIC DISPERSING AGENTS

Louis H. Howland, Watertown, Victor S. Chambers, Naugatuck, and Robert MacFarlane, Jr., Hamden, Conn., assignors to United States Rubber Company, New York, N.Y., a corporation of New Jersey

No Drawing. Filed Apr. 6, 1962, Ser. No. 185,509
4 Claims. (Cl. 260—23.7)



1. In the method of making a synthetic rubber latex by subjecting to polymerizing conditions an aqueous emulsion of polymerizable synthetic rubber forming monomers containing 3 to 10 parts of anionic surface-active dispersing agent per 100 parts of polymerizable monomers, the improvement which comprises carrying out the polymerization in the presence of polyoxyethylated castor oil, the amount of said polyoxyethylated castor oil being from 0.004 to 2 parts per 100 parts of the original rubber forming monomers, said synthetic rubber forming monomers being selected from the group consisting of butadiene-1,3, isoprene, 2,3-dimethylbutadiene-1,3, piperylene, mixtures of such butadienes-1,3 with one another, and mixtures of such butadienes-1,3 with monoethylenic compounds which contain a $CH_2{=}C<$ group and are copolymerizable with butadienes-1,3, said monoethylenic compounds being up to 70% by weight of such mixtures, said anionic surface-active agent comprising 0.2 to 1 part selected from the group consisting of sulfonated and sulfated surface-active agents and the remainder of the 3 to 10 parts being selected from the group consisting of water-soluble soaps of higher fatty acids and water-soluble soaps of rosin acids.

3,272,768

METHOD OF COAGULATING RUBBERY POLYMER LATICES

John D. Sutherland, Jr., Baton Rouge, La., Kjetil Gauslaa, Sarpsborg, Norway, and Robert A. Gerlicher, Baton Rouge, La., assignors to Copolymer Rubber and Chemical Corporation, a corporation of Louisiana

Filed July 10, 1963, Ser. No. 295,285
19 Claims. (Cl. 260—27)

1. A method of coagulating rubbery polymer latices comprising the steps of partially irreversibly coagulating an intimate mixture including rubbery polymer latex and carbon black slurry with fresh coagulant substantially free of recycled serum, the partially coagulated mixture containing visible particles of coagulum and about 5–80% by weight of the rubbery polymer orginally present in the latex being irreversibly coagulated, dispersing rubbery polymer processing oil in the partially coagulated mixture, and further coagulating the partially coagulated mixture with fresh coagulant substantially free of recycled serum in the presence of the rubbery polymer processing oil, the mixture of rubbery polymer latex and carbon black slurry containing 100–200 parts by weight of carbon black for each 100 parts by weight of rubbery polymer and the rubbery polymer latex being selected from the group consisting of latices of homopolymers of conjugated diolefins, latices of copolymers of conjugated diolefins and monoethylenically unsaturated monomers copolymerizable therewith and mixtures thereof.

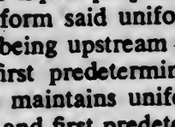
EPOXIDE-POLYESTER COMPOSITIONS AS MODIFIERS FOR THERMOPLASTIC RESINS

Csaba K. Hunyar, 8533 Apperson St., Sunland, Calif.



No Drawing. Filed June 14, 1965, Ser. No. 463,867
10 Claims. (Cl. 260—27)

7. The process for modifying a vinyl thermoplastic resin subject to processing for improving the physical properties thereof which comprises the steps of reacting

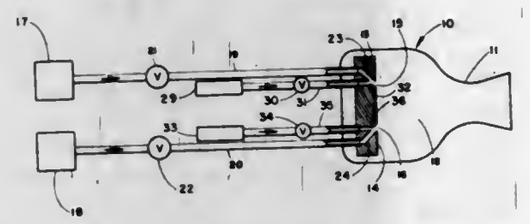
(I) from about 30 to 60 parts by weight of a polyester material of acid number of about 30–60 containing free carboxyl groups and selected from the class consisting of natural rosins and the reaction product obtained by esterifying polyhydric alcohol and an organic acid containing two carboxyl groups and having a chain length of 1 to 12 carbon atoms, said polyhydric alcohol being selected from the class consisting of alkyl and aryl alcohols containing two hydroxyl groups, with

(II) from about 10 to about 40 parts by weight of a non-plasticizing complex epoxide containing active oxirane rings and selected from the class consisting of epichlorohydrin diphenol condensate and epoxies condensed from organic dioxides,

(III) in the presence of from about 10 to about 50 parts by weight of a catalyst selected from the class consisting of quaternary alkyl and aryl amines of the structural formula:

where R_2, R_3 and R_4 are alkyl groups, R_1 is selected from the class consisting of aryl groups and alkyl groups of a carbon chain length of 8–22, and X^- is an anion that does not form an insoluble product with the action group, thereby to form the thermoplastic modifier composition,

and adding from about 2 to about 50 percent by weight of said modifier composition to a vinyl thermoplastic resin to form a thermoplastic admixture, and mechanically working said admixture.



10. The product obtained by the process of claim 7.

3,272,770

METHOD AND MANUFACTURE FOR PROPELLANT AERATION

Duane W. Landahl, San Jose, Calif., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Filed Feb. 1, 1963, Ser. No. 255,516
2 Claims. (Cl. 60—35.3)

1. A method of controlling the density of a liquid propellant for consumption in a reaction motor in which the thrust produced is responsive to changes in propellant density comprising the steps of providing a liquid propellant; flowing said liquid propellant to a first predetermined point for combustion; providing a fluid suitable for density modification of said liquid propellant, said fluid being capable of forming an initially uniform two-phase mixture with said liquid propellant which mixture has a tendency to separate into separate phases; injecting said fluid into said liquid propellant at a second predetermined point to form said uniform two-phase mixture, said second point being upstream from and immediately adjacent to said first predetermined point so that said two-phase mixture maintains uniformity during flow between said second and first predetermined points; and selectively varying the rate at which said fluid is injected into said liquid propellant to vary the density of the propellant and to control the thrust of said reaction motor.

3,272,771

METHOD FOR THE CROSSLINKING OF POLYMERIC MATERIALS

Robert Marion Busche and Dennis Light Funck, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed July 10, 1963, Ser. No. 295,287
24 Claims. (Cl. 260—41)

1. A composition comprising an addition polymer of an ethylenically unsaturated monomer containing polymerized therewith a carboxylic acid group containing monoethylenically unsaturated monomer, said acid group containing monomer being present in a concentration of at least 0.2 mol percent, based on the polymer, and homogeneously admixed therewith, a hydrolyzable, cocrystallized oxide of a base forming metal and an amphoteric element wherein the base forming metal is a metal selected from the class consisting of metals of Group I and Group II of the Periodic Table, and the amphoteric element is an element selected from the group consisting of silicon, aluminum, titanium, vanadium, molybdenum, tungsten, chromium, manganese, arsenic, bismuth, tin, lead, and antimony, said oxide being employed in a concentration of 2 to 90 weight percent, based on the total composition.

3,272,772

FILLED POLYMER COMPOSITIONS

Joseph L. Russell, Ridgewood, N.J., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Aug. 30, 1961, Ser. No. 134,863
8 Claims. (Cl. 260—41)

1. A composition of matter which comprises from 1 to 4 parts by weight of chlorinated high density polyethylene and uniformly dispersed throughout said chlorinated polyethylene from 1 to 4 parts by weight of an inorganic filler having adsorbed thereon a polar group-containing polymerizable vinyl monomer.

3,272,773

PROCESS OF PRODUCING STABILIZED POLYCARBONAMIDES CONTAINING A METAL CHELATE OF 8-HYDROXYQUINOLINE

David Holmes Edison, Signal Mountain, Tenn., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

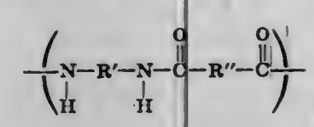
No Drawing. Filed Oct. 1, 1962, Ser. No. 227,572
3 Claims. (Cl. 260—45.75)

1. In a process of spinning yarn from a molten synthetic polycarbonamide which has been filtered through a sand pack, the improvement which consists of incorporating in said melt in an amount of at least 0.005% based on the weight of said polycarbonamide, at a point upstream from said sand pack, a metal chelate of an 8-hydroxyquinoline which is stable at the temperature of said melt, whereby to produce a yarn of improved durability to heating in open air without cumulatively plugging said sand pack by deposition of metal particles as the melt passes through it.

3,272,774

POLY(ARYLESTER-AMIDES) DERIVED FROM (1) DIPHENOLS, (2) DIAMINES, AND (3) POLYBASIC ACIDS

Wendell W. Moyer, Jr., Parkersburg, W. Va., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois



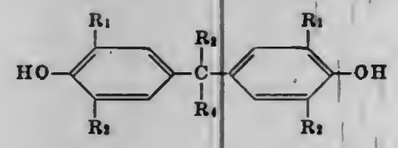
No Drawing. Filed Jan. 2, 1962, Ser. No. 163,902
1 Claim. (Cl. 260—47)

A linear polymeric composition having an inherent viscosity of at least 0.17 when measured in m-cresol at 25° C., said polymer comprising in its linear chain from about

5 to about 95 mole percent recurring phenyl ester groups of the formula

and correspondingly from about 5 percent to about 95 mole percent recurring amide groups of the formula

wherein R, R', and R'', are radicals selected from the group consisting of alkyl, aryl, and benzene ring carbon to benzene ring carbon bonds and Ar is a radical selected from the group consisting of aryl and alkaryl radicals.



3,272,775

PREPARATION OF AROMATIC POLYETHERS FROM A BISPHENOL

Edward J. McNelis, Wallingford, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed July 16, 1964, Ser. No. 383,252
17 Claims. (Cl. 260—47)

1. Method for preparing aromatic polyethers which comprises contacting a material having the general formula

wherein R_1, R_2, R_3, and R_4 are selected from the group consisting of hydrogen and alkyl radicals having from 1 to 3 carbon atoms with activated manganese dioxide at a temperature in the range of from 20° to 250° C. for a period of time ranging between 10 seconds and 10 hours and thereafter recovering said aromatic polyether product.

9. Method for preparing aromatic polyethers which comprises contacting 2,2' - bis - (4 - hydroxy - 3,5 - dimethyl phenyl)propane with from 0.01 to 100.0 moles of lead dioxide per mole of 2,2' - bis - (4-hydroxy-3,5-dimethyl phenyl)propane at a temperature in the range of from 20° to 250° C. for a period of time ranging between 10 seconds and 10 hours and thereafter recovering said aromatic polyether.

3,272,776

PREPARATION OF POLY(ESTER-AMIDES)

John R. Caldwell, Kingsport, Tenn., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Apr. 5, 1962, Ser. No. 185,206
17 Claims. (Cl. 260—47)

1. The process of producing a linear high molecular weight film and fiber forming poly(ester-amide) which comprises reacting in an aqueous solution a diammonium salt of a dicarboxylic acid with an aminoalcohol at a temperature within the range of 100–200° C., said diammonium salt and said aminoalcohol being present in substantially equal molecular proportions, continuing the reaction within this temperature range until the water from the solution and the water formed in the reaction are removed, thereafter continuing the reaction at a temperature within the range of 200–300° C. and continuing the reaction at reduced pressure below about 5 mm. of Hg pressure whereby the poly(ester-amide) is formed.

3,272,777

METHOD FOR POLYMERIZING ALDEHYDES

Shinichi Ishida, Itabashi-ku, Tokyo, Japan, assignor to Asahi Kasei Kagyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan

No Drawing. Filed Apr. 18, 1961, Ser. No. 103,711
Claims priority, application Japan, Apr. 26, 1960, 35/22,104; Nov. 2, 1960, 35/44,091; Nov. 10, 1960, 35/44,352, 35/44,353
10 Claims. (Cl. 260—67)

1. A method for producing crystalline polyether type polyaldehydes which comprises premixing a monoaldehyde of 2 to 10 carbon atoms and of the general formula RCHO, wherein R is a member selected from the group consisting of alkyl, cycloalkyl and halogen substituted alkyl, with a catalyst selected from the group consisting of MR'_3 and MR'_2X, wherein R' is a member selected from the group consisting of lower alkyl and lower alkoxy, M is a member selected from the group consisting of aluminum and boron, and X is halogen in a solvent medium at a temperature between room temperature and the polymerization temperature and thereafter lowering the temperature to a temperature of −20° C. to −120° C. to initiate polymerization.

3,272,778

PROCESS FOR POLYMERIZING ALDEHYDES

Shinichi Ishida, Tokyo, Japan, assignor to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan

No Drawing. Filed Apr. 18, 1961, Ser. No. 103,730
Claims priority, application Japan, Nov. 2, 1960, 35/44,091; Nov. 10, 1960, 35/44,352, 35/44,353
3 Claims. (Cl. 260—67)

1. In a process for the production of polymers of aldehydes comprising polymerizing at least one aldehyde in the presence of a catalyst and subsequently separating the polymer formed, the improvement wherein crystalline polyether type polymers are produced by

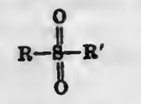
(1) premixing (a) a member selected from the group consisting of a monoaldehyde having from 2 to 10 carbon atoms in the molecule and having the formula RCHO wherein R represents a member selected from the group consisting of alkyl, haloalkyl, furfural and 2-formyl-3,4-dihydro-2H-pyran (b) a catalyst selected from the group consisting of MR_2' and $MR'X$ wherein R' represents a member selected from the group consisting of alkyl and alkoxy wherein the alkyl moiety is of from 1 to 10 carbon atoms; M represents a member selected from the group consisting of magnesium, calcium and zinc; and X represents halogen, said premixing being conducted in an inert solvent medium and at a temperature between room temperature and −30° C.,

(2) lowering the temperature to a range of from −30° C. to −120° C. to thereby initiate polymerization, and

(3) maintaining the temperature at from −30° C. to −120° C. until the polymerization is complete.

3,272,779

INTERPOLYMERS OF FORMALDEHYDE AND AROMATIC SULFONES



Murray H. Reich, Princeton, N.J., assignor to Ethyl Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Filed Mar. 28, 1963, Ser. No. 268,569
12 Claims. (Cl. 260—67)

1. A high molecular weight linear thermoplastic copolymer of

(a) a formaldehyde selected from the group consisting of essentially anhydrous monomeric formaldehyde and essentially anhydrous trioxane, and

(b) an aromatic sulfone having the formula

wherein R is selected from a group consisting of aromatic radicals and alkyl substituted aromatic radicals and R' is selected from a group consisting of aryl, alkaryl, alkyl and hydrogen, R and R' each having up to about 60 carbon atoms; the amount of said aromatic sulfone monomer chemically combined in said copolymer ranging from about 0.1 mole percent up to about 15 mole percent of the copolymer; said copolymer being characterized by having a polymer melting temperature of from about 140° C. up to about 190° C.

3,272,780

COPOLYMERS OF TRIOXANE, ANOTHER ALDEHYDE HAVING AT LEAST TWO CARBON ATOMS AND OPTIONALLY A THIRD COMONOMER

Walter Wilson and Herbert May, Birmingham, England, assignors to British Industrial Plastics Limited, London, England, a corporation of Great Britain

No Drawing. Filed Oct. 13, 1961, Ser. No. 144,843
Claims priority, application Great Britain, Oct. 17, 1960, 35,584/60
16 Claims. (Cl. 260—73)

1. A process for the preparation of a copolymer which comprises reacting trioxan with an aldehyde that yields a copolymer having at least 2 carbon atoms under substantially anhydrous conditions and in the presence of an electrophilic catalyst.

3. A process as claimed in claim 1 in which trioxan is reacted with an aldehyde and a compound capable of copolymerizing with trioxan in the presence of an electrophilic catalyst, the compound being selected from the group consisting of a cyclic ether, a vinyl compound, an allyl ether and an allyl ester.

3,272,781

BOROUREAS OF PHOSPHINOBORINE POLYMERS

Marvin H. Goodrow, Los Angeles, Calif., assignor to American Potash & Chemical Corporation, Los Angeles, Calif., a corporation of Delaware

No Drawing. Filed Aug. 7, 1963, Ser. No. 300,697
16 Claims. (Cl. 260—77.5)

1. A process for preparing a phosphinoborine borourea compound which comprises reacting a phosphinoborine polymer with an amine, said phosphinoborine polymer being selected from at least one of the group consisting of:

(*a*) $[R_4R_3PB(Y)_2]_n$
(*b*) $[R_4R_3PB(Y)_2]_nA$
(*c*) $[(Y)_2BP(R_3)R(R_3)PB(Y)_2]_n$, and
(*d*) $[R_4R_3PB(Y)_2]_m[R_3PBY]_z$

wherein

Y is selected from the group consisting of hydrogen, hydrocarbyl and isocyanato substituents; at least one of said Y substituents in each of said (*a*) (*b*) (*c*) and (*d*) being isocyanato;

R_3 and R_4 are hydrocarbyl substituents which are independently selected for each monomeric unit;

R is a hydrocarbylene substituent;

n is an integer indicative of the degree of polymerization of said phosphinoborine compound;

m and *z* are integers, the ratio of which is indicative of the degree of ring fusion in said polymer (*d*);

A is a basic terminating group;

and said amine is selected from at least one of the group consisting of:

(1) $(HNR_1)_sR_s$

and

(2) 

wherein

R_1 and R_s are each independently selected from the group consisting of hydrogen, acyclic, alicyclic and arene substituents;

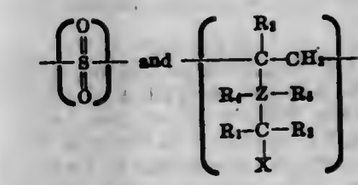
R is a bivalent hydrocarbyl substituent;

t is an integer equal to the valence of the substituent R_s; and

s is an integer equal to the number of R substituents in the amine having the structural Formula 2; and

recovering said borourea compound.

9. The product prepared by the process of claim 1.



3,272,782

DERIVED COPOLYMERIC SULFONES

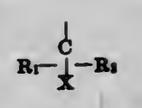
John L. Lang, 42 Windgate Drive, Box 820—111, Murrysville, Pa.

No Drawing. Filed July 16, 1962, Ser. No. 210,236
9 Claims. (Cl. 260—79.3)

1. A water-dispersible polyelectrolyte produced by reacting a nuclophilic reagent with a copolymer including repeating units of

wherein

Z is an aromatic nucleus,



X is a halogen selected from the class consisting of chlorine and bromine,

R_1 and R_2 are individually selected from the class consisting of hydrogen and lower alkyl radicals,

R_3 is selected from the class consisting of hydrogen and methyl, and

R_4 and R_5 are individually selected from the class consisting of hydrogen, chlorine, bromine and lower alkyl radicals; and

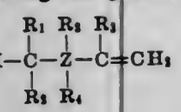
wherein at least a portion of the

groups are reacted with said nucleophilic reagent, the reaction being carried out at a temperature and pressure which will preclude decomposition of the copolymer.

3,272,783

RUBBERY POLYMER VULCANIZATION

Robert V. Lucke, Fanwood, N.J., assignor to United States Rubber Company, New York, N.Y., a corporation of New Jersey



No Drawing. Filed Jan. 31, 1963, Ser. No. 255,220
18 Claims. (Cl. 260—79.3)

1. A vulcanizable composition comprising a rubbery polymer containing a basic nitrogen group and a minor proportion of a disulfonyl halide having the formula $R(SO_2X)_2$, where X is a halogen selected from the group consisting of fluorine, chlorine and bromine; R is a member selected from the group consisting of aliphatic radicals, aromatic radicals, and aromatic radicals separated by a member selected from the group of oxygen, sulfur, and alkylidene groups.

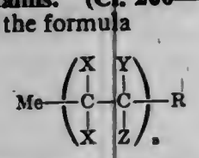
3,272,784
COPOLYMERIC SULFONES
John L. Lang, 42 Windgate Drive, Box 820—111, Murrysville, Pa.
No Drawing. Filed July 16, 1962, Ser. No. 210,237
3 Claims. (Cl. 260—79.3)

1. The process for preparing a water-dispersible polyelectrolyte comprising polymerizing (a) sulfur dioxide and (b) the reaction product of

(i) a monomer having the general formula

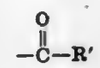
wherein

Z is an aromatic nucleus,
X is a halogen selected from the class consisting of hydrogen and lower alkyl radicals,
R_1 and R_2 are individually selected from the class consisting of hydrogen and lower alkyl radicals,
R_3 is selected from the class consisting of hydrogen and methyl, and
R_4 and R_5 are individually selected from the class consisting of hydrogen, chlorine, bromine and lower alkyl radicals; and



(ii) a nucleophilic reagent.

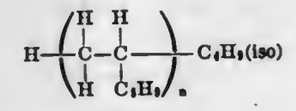
3,272,785
METHOD OF THERMOSETTING HYDROXYL-CONTAINING ESTER POLYMERS
Sheldon N. Lewis, Willow Grove, and Andrew Mercurio, Philadelphia, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware
No Drawing. Filed June 10, 1963, Ser. No. 286,462
7 Claims. (Cl. 260—80.5)



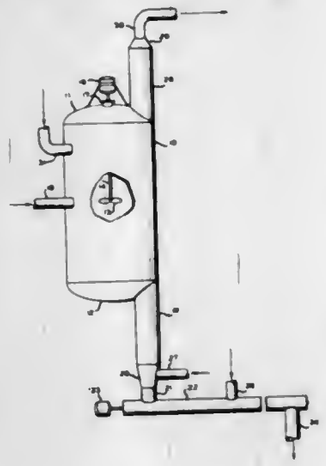
1. A method of curing a composition containing as the sole polymeric components, a polymerized material selected from the group consisting of (1) a polymer containing at least 2% by weight of units having an alcoholic hydroxyl group attached to a carbon atom which is directly attached solely to atoms selected from the group consisting of carbon and hydrogen, said polymers containing at least 2% by weight of units of at least one ester of an α,β-monoethylenically unsaturated acid, and (2) a mixture of (a) a polymer containing units having an alcoholic hydroxyl group attached to a carbon atom which is directly attached solely to atoms selected from the group consisting of carbon and hydrogen and (b) a polymer containing units of at least one ester of an α,β-monoethylenically unsaturated acid, the amount of the hydroxyl-containing units and the amount of the ester units each being at least 2% by weight, based on the weight of the mixture of polymers, which comprises heating the composition in contact with 0.1 to 5% by weight, based on the weight of polymerized material therein, of a compound selected from the group consisting of magnesium perchlorate, zinc perchlorate, and mixtures thereof.

3,272,786
POLYMERIZATION PROCESS USING CHAIN-TRANSFER AGENTS
Eli Perry, Galveston, Tex., assignor to Monsanto Company, a corporation of Delaware
No Drawing. Filed Apr. 21, 1961, Ser. No. 104,543
10 Claims. (Cl. 260—88.7)

1. Compounds of the formula



wherein Me is chosen from the group consisting of aluminum, boron, gallium, indium, zinc, cadmium, mercury, silicon, germanium, tin, lead, antimony, and bismuth; X is a member of the group consisting of hydrogen and halogen; Y is chosen from the group consisting of hydrogen, halogen, and the methyl radical; Z is chosen from the group consisting of halogen, aryl, aralkyl, alkaryl, —CN, —COOH, —C—O—R′, and

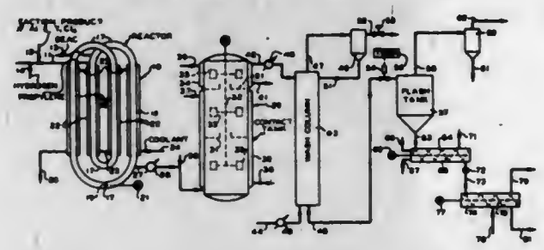


radicals, R′ being an alkyl radical; R is chosen from the group consisting of alkyl, aryl, aralkyl, and alkaryl hydrocarbon radicals; and n is an integer from 2 to 500,000.

3. Compounds of the formula

wherein n is an integer from 2 to 20.

3,272,787
EXTRACTION OF SOLUBLE MATTER FROM POLYMER SOLIDS
Jack S. Scoggin and Lowell T. Price, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed June 5, 1961, Ser. No. 114,727
3 Claims. (Cl. 260—93.7)



1. A process for removing soluble organometallic catalysts and other soluble matter from polyolefin solids which comprises contacting said solids with a solvent for said organometallic catalyst, said solvent being one selected from the group consisting of low molecular weight organic acids, alcohols and mixtures thereof, under turbulent conditions in a mixing vessel whereby said organometallic catalyst is dissolved by said solvent leaving polymer solids; maintaining a quiescent zone in a lower extension of said vessel so that said polymer solids settle therein, said quiescent zone having a diameter in the range of from ⅕ to ⅓ the diameter of said mixing vessel, a height in the range of from ¾ to 1½ times the height of said mixing vessel and a length to diameter ratio in the range of from 3/1 to 7/1 whereby sufficient quiescence is maintained in said zone to effect the settlement of said polymer solids therein; withdrawing settled polymer solids from said extension; compacting said withdrawn solids while backwashing same with fresh solvent for said other soluble matter, said solvent being forced into said mixing vessel through said lower extension; passing the compacted polymer solids to further recovery steps and withdrawing solution of soluble matter in solvent through an upward extension of said mixing vessel in non-turbulent flow at a velocity below the transport velocity of said solids.

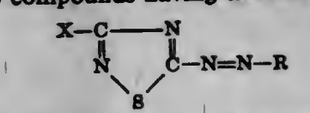
3,272,788
COMBINATION SLURRY-SOLUTION POLYMERIZATION PROCESS
Richard E. Dietz, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Aug. 23, 1962, Ser. No. 218,843
5 Claims. (Cl. 260—93.7)

1. In a solution polymerization process in which a 1-olefin, hereinafter designated a principal monomer, is polymerized in the presence of a catalyst comprising a mixture of a salt of a metal of Groups IV, V, VI and VIII and an organo compound of a metal of Groups I, II and III, the improvement comprising conducting, prior to the polymerization of said principal monomer, polymerization of an auxiliary monomer in the presence of the catalyst to be used for the polymerization of the principal monomer, said auxiliary monomer being a 1-olefin which forms a polymer which is insoluble in the diluent used at the temperature of the solution polymerization of the principal monomer, the polymerization of said auxiliary monomer being carried out at a temperature at which the polymer of the auxiliary monomer is insoluble in the diluent and the polymerization of said principal monomer being carried out at a temperature at which said polymer of said auxiliary monomer is insoluble and said polymer of said principal polymer is soluble in the diluent, and separating said insoluble polymer of said auxiliary monomer from the solution of said polymer of said principal monomer.

3,272,789
TREATMENT OF OLEFIN POLYMERS TO REMOVE CATALYST RESIDUES
Richard S. Joyner and Louis E. Perrier, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Jan. 24, 1963, Ser. No. 253,632
15 Claims. (Cl. 260—93.7)

11. In a mass polymerization process wherein a liquid mono-1-olefin is contacted with a catalyst formed by mixing materials comprising an organometal compound and a metal salt under polymerization conditions so as to form solid polymer and wherein an effluent containing solid polymer, soluble polymer, catalyst residues and liquid olefin is recovered from said polymerization and said effluent is mixed with a diketone under conditions such that said olefin remains in the liquid phase, the improvement which comprises recovering the thus treated effluent and introducing same into an upper portion of an elongated washing zone; introducing a wash liquid comprising a low boiling hydrocarbon into a lower portion of said washing zone; maintaining said washing zone under conditions such that said wash liquid remains in the liquid phase, the temperature of said upper portion of said washing zone being in the range of 90 to 130° F. and the temperature of said lower portion of said washing zone being in the range of 50 to 89° F., and recovering from said lower portion of said washing zone a slurry of solid polymer in said wash liquid.

3,272,790
POLYPEPTIDES
Luigi Bernardi, Milan, Germano Bosisio, Palazzolo Milanese, Milan, and Francesco Chillemi and Onofrio Goffredo, Milan, Italy, assignors to Società Farmaceutici Italia, Milan, Italy, a corporation of Italy
No Drawing. Filed Jan. 20, 1964, Ser. No. 338,574
Claims priority, application Italy, Jan. 25, 1963, 1,586/63
12 Claims. (Cl. 260—112.5)

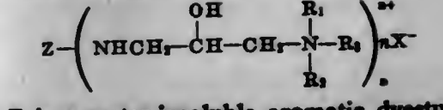


3. A polypeptide of the formula:

X-L-alanyl-L-phenylalanyl-L-isoleucyl-glycyl-L-leucyl-L-methioninamide

wherein X represents L-lysyl-L-aspartyl, L-seryl-L-lysyl-L-aspartyl, or L-prolyl-L-seryl-L-lysyl-L-aspartyl, the salts and protected derivatives thereof having the amino and carboxyl groups not involved in the formation of the peptidic linkage duly blocked by protecting groups capable of being removed.

3,272,791
MONOAZO COMPOUNDS CONTAINING A 5-AMINO - 3 - SUBSTITUTED - 1,2,4 - THIADIAZOLE RADICAL
William H. Moore, Edmund B. Towne, and Joseph B. Dickey, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Filed Mar. 29, 1963, Ser. No. 269,167
11 Claims. (Cl. 260—155)



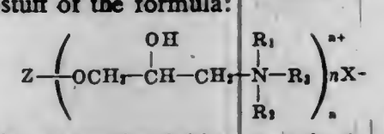
1. The azo compounds having the formula:

wherein X represents a member selected from the group consisting of a low carbon alkylthio radical and a low carbon alkyl sulfonyl radical and R represents a member selected from the group consisting of the radical of a tetrahydroquinoline coupling compound free of a water-solubilizing group and the radical of a benzomorpholine coupling compound free of a water-solubilizing group, and wherein said tetrahydroquinoline and benzomorpholine radicals are joined through the carbon atom in their 6-positions to the azo linkage.

3,272,792
QUATERNARY AMMONIUM SALTS OF AMINO HALOHYDRIN DYESTUFFS
David Taber, Wilmette, Ill., Edgar E. Renfrew, White Bear Lake, Minn., and Henry W. Pons, Lock Haven, Pa., assignors to American Aniline Products, Inc., a corporation of Delaware
No Drawing. Filed June 22, 1964, Ser. No. 377,131
3 Claims. (Cl. 260—155)

1. A dyestuff of the formula:

wherein Z is a water-insoluble aromatic dyestuff moiety selected from the group consisting of azo and anthraquinone; R_1, as an individual substituent, is a member selected from the group consisting of phenyl and lower alkyl, R_2, as an individual substituent, is lower alkyl, R_3, as an individual substituent, is lower alkyl, and R_1, R_2 and R_3 taken collectively with the N atom to which they are attached represent the residue of an azaaromatic nucleus selected from the group consisting of pyridine, lower alkylpyridines, quinoline, and isoquinoline; n is an integer having a value of 2 to 4; and X^- is a member selected from the group consisting of chlorine and bromine, the secondary amino nitrogen of at least two of said n groups being linked directly to one aromatic ring of the Z moiety.



3,272,793

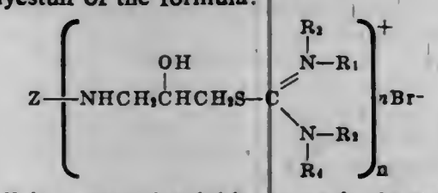
QUATERNARY AMMONIUM SALTS OF HALOHYDRIN ETHER DYESTUFFS

David Taber, Wilmette, Ill., Edgar E. Renfrew, White Bear Lake, Minn., and Henry W. Pons, Lock Haven, Pa., assignors to American Aniline Products, Inc., a corporation of Delaware

No Drawing. Filed June 22, 1964, Ser. No. 377,087
5 Claims. (Cl. 260—156)

1. A dyestuff of the formula:

wherein Z is a water-insoluble aromatic dyestuff moiety selected from the group consisting of azo and anthraquinone; R_1, as an individual substituent, is a member selected from the group consisting of phenyl and lower alkyl; R_2, as an individual substituent, is lower alkyl; R_3, as an individual substituent, is lower alkyl; and R_1, R_2 and R_3 taken collectively with the N atom to which they are attached, represent the residue of an azaaromatic nucleus selected from the group consisting of pyridine, lower alkyl pyridines, quinoline, and isoquinoline; *n* is an integer having a value of 2 to 4; and X is a member selected from the group consisting of chlorine and bromine, the oxygen atom of at least two of said *n* groups being linked directly to one aromatic ring of the Z moiety.



3,272,794

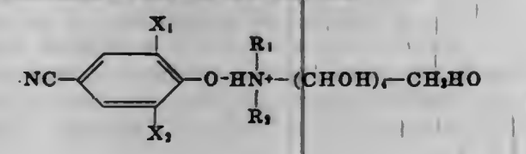
ISOTHIURONIUM SALTS OF AMINO BROMOHYDRIN DYESTUFFS

David Taber, Wilmette, Ill., Edgar E. Renfrew, St. Paul, Minn., and Henry W. Pons, Monroeville, Pa., assignors to American Aniline Products, Inc., a corporation of Delaware

No Drawing. Filed Feb. 3, 1964, Ser. No. 342,251
5 Claims. (Cl. 260—157)

1. A dyestuff of the formula:

wherein Z is a water-insoluble aromatic dyestuff moiety selected from the group consisting of azo, anthraquinone, phthalocyanine and nitro; R_1 and R_2, as individual substituents, are members selected from the group consisting of hydrogen and lower alkyl and, taken collectively, represent an alkylene bridge having from 2 to 3 carbon atoms, said bridge connecting the N atoms to which R_1 and R_2 are attached; R_3 and R_4 are members selected from the group consisting of hydrogen and lower alkyl; and *n* is an integer having a value of from 1 to 4, the amino nitrogen attached to Z being directly linked to an aromatic carbon atom of the Z moiety.



3,272,795

GLUCAMINE SALTS OF BENZONITRILES

Basil Jason Heywood, Hornchurch, William George Leeds, London, and Raymond Frederick Collins, Harold Wood, England, assignors to May & Baker Limited, Dagenham, England

No Drawing. Filed May 24, 1965, Ser. No. 458,414
Claims priority, application Great Britain, May 26, 1964, 21,781/64
3 Claims. (Cl. 260—211)

1. Glucamine salts of the formula:

wherein X_1 and X_2 represent a member of the class consisting of bromine and iodine atoms, and R_1 and R_2 represent a member of the class consisting of hydrogen, methyl, ethyl, 2-hydroxyethyl and 2-hydroxypropyl.

3,272,796

SALT OF ALKALOID FROM *PHYLLANTHUS DISCODEUS*

Jean Louis Paul Mainil, Watermael-Boitsfort, Belgium, assignor to Société Anonyme Oletta, Luxembourg, Luxembourg

No Drawing. Filed Aug. 13, 1962, Ser. No. 216,316
Claims priority, application Belgium, Aug. 16, 1957, 442,303, Patent 560,107
1 Claim. (Cl. 260—236)

The camposulphonate of ethylene diamine and of an alkaloid, said camposulphonate having a slight pink color and a melting point of 202° C., said alkaloid being prepared by a process comprising finely grinding a part of the *discodeus* species of the genus Phyllanthus (Euphorbiaceae), rendering said part alkaline, treating said part with an organic solvent selected from the group consisting of ether, benzene, chloroform and ethylacetate to derive an extract of active material, acidifying the extract with an aqueous solution of an acid at a concentration of from 2% to 20% whereby the alkaloid is caused to pass into the acid solution, adding a base to make the solution alkaline thereby forming a crude alkaloidal product, extracting the alkaloid with one of the group consisting of ether and chloroform, and distilling the extract to obtain a residue comprising the alkaloid and other substances, and separating the alkaloid by dissolution and chromatography, the said alkaloid having the following properties:

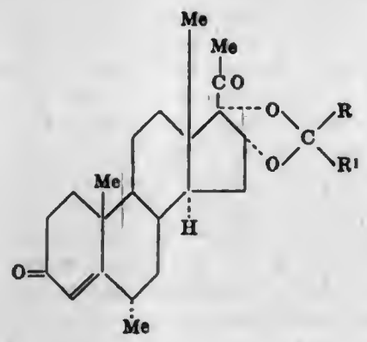
3,272,797

CYCLIC ACETALS AND KETALS OF THE 6α-METHYLPREGNANE SERIES AND PROCESS FOR PREPARING SAME

Sheila Mary Booker, Bernard Ellis, and Vladimir Petrow, all of London, England, assignors to The British Drug Houses Limited, London, England, a British company

No Drawing. Filed May 5, 1960, Ser. No. 26,979
Claims priority, application Great Britain, May 11, 1959, 16,117/59
12 Claims. (Cl. 260—239.55)

7. 3β - hydroxy - 16α:17α - (2' - phenyl - 4':5' - dioxolane)pregn-5-en-20-one.



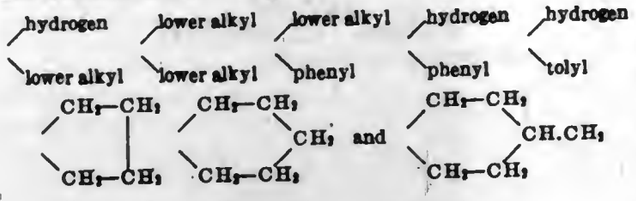
3,272,798

16α:17α-DERIVATIVES OF 6α-METHYL STEROIDS

Bernard Ellis and Vladimir Petrow, London, England, assignors to The British Drug Houses Limited, London, England, a company of Great Britain

No Drawing. Filed Jan. 20, 1960, Ser. No. 3,498
Claims priority, application Great Britain, Jan. 23, 1959, 2,630/59
16 Claims. (Cl. 260—239.55)

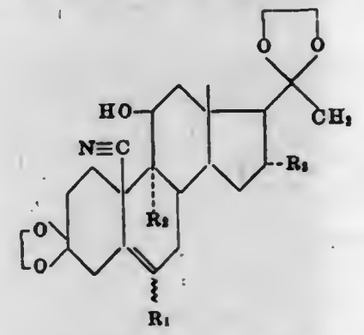
1. 6α-methyl steroids of the pregnane series having the general formula



(I)

where

are selected from the group consisting of



3,272,799

11,19-SUBSTITUTED PROGESTERONES

Kenneth G. Holden, Haddon Heights, N.J., and James F. Kerwin, Broomall, Pa., assignors to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed Oct. 25, 1962, Ser. No. 233,137
6 Claims. (Cl. 260—239.55)

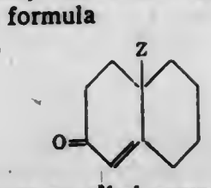
5. A chemical compound of the formula:

in which:

R_1 is a member selected from the group consisting of hydrogen, methyl and fluoro;

R_2 is a member selected from the group consisting of hydrogen and fluoro; and

R_3 is a member selected from the group consisting of hydrogen and methyl.



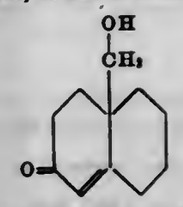
3,272,800

PROCESS FOR PREPARING Δ⁴-3-KETOSTEROIDS

Katsumi Tanabe, Rinji Takasaki, Ryozo Hayashi, Yasuhiro Morisawa, Teruo Hashimoto, and Yutaka Okada, all of Tokyo, Japan, assignors to Sankyo Company Limited, Tokyo, Japan

No Drawing. Filed Sept. 27, 1965, Ser. No. 490,657
Claims priority, application Japan, Sept. 30, 1964, 39/55,859; Oct. 6, 1964, 39/57,012; Jan. 19, 1965, 40/2,850; June 11, 1965, 40/34,704
12 Claims. (Cl. 260—239.55)

1. A process for preparing a Δ⁴-3-ketosteroid having the partial structure, with which only rings A and B are concerned, of the formula



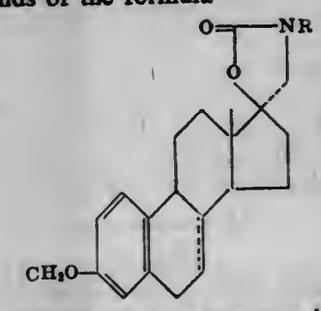
wherein Z represents an alkyl group or a hydroxymethyl group that may be etherified or esterified which comprises heating a 3,5-cyclosteroid having the partial structure, with which only rings A and B are concerned, of the formula

wherein X represents an alkyl group or a hydroxymethyl group that may be etherified or esterified; Y represents hydroxy group, an etherified hydroxy group or an esterified hydroxy group; or X and Y jointly may form a 6β,19-oxido linkage, together with an alkylsulfoxide, the said Z being as defined above with relation to the said X when the said X and Y separately are as defined above and hydroxymethyl group when the said X and Y jointly form a 6β,19-oxido linkage.

5. A process for preparing a 19-hydroxy-Δ⁴-3-ketosteroid having the partial structure, with which only rings A and B are concerned, of the formula

which comprises heating a 3,5-cyclosteroid having the partial structure, with which only rings A and B are concerned, of the formula

together with an alkylsulfoxide.



3,272,801

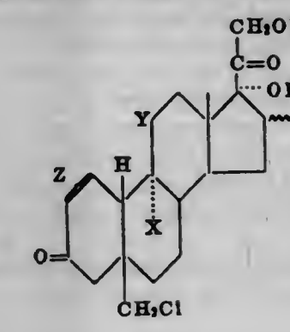
STEROIDAL SPIRO-OXAZOLIDINONES

David J. Marshall, Hampstead, and Clara Revesz, Montreal, Quebec, Canada, assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Nov. 19, 1964, Ser. No. 412,303
14 Claims. (Cl. 260—239.55)

1. Compounds of the formula

where R is selected from the group consisting of hydrogen and lower alkyl.



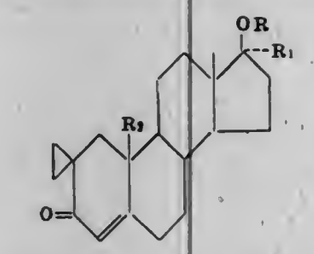
3,272,802

5β-CHLOROMETHYL-19-NOR-ANDROSTANE AND PREGNANE DERIVATIVES AND PROCESS FOR PRODUCTION THEREOF

Lawrence H. Knox, Mexico City, Mexico, assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed Oct. 23, 1964, Ser. No. 406,157
21 Claims. (Cl. 260—239.55)

12. A compound of the following formula:



wherein R is selected from the group consisting of hydrogen and a hydrocarbon carboxylic acyl group of less than 12 carbon atoms; R^3 is a hydrogen; X is selected from the group consisting of hydrogen, fluorine and chlorine; Y is a member of the group consisting of β-hydroxyl and keto; Z is selected from the group consisting of a single bond and a double bond; T is selected from the group consisting of hydrogen and methyl; and OR^3 and T together form a 16α,17a-lower alkylidenedioxy grouping.

3,272,803
2,2-ETHYLENETESTOSTERONES

Kenneth G. Holden, Stratford, N.J., assignor to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed Feb. 25, 1965, Ser. No. 435,355
9 Claims. (Cl. 260—239.55)

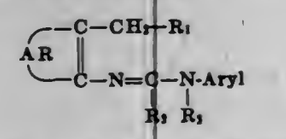
1. A chemical compound of the formula:

wherein:

R is a member selected from the group consisting of hydrogen, cyclopenten-1-yl, tetrahydropyranyl and acyl of from 2 to 10 carbon atoms;

R_1 is a member selected from the group consisting of hydrogen, methyl, ethyl and ethynyl; and

R_2 is a member selected from the group consisting of hydrogen and methyl.



8. 2,2-ethylenetestosterone tetrahydropyranyl ether.

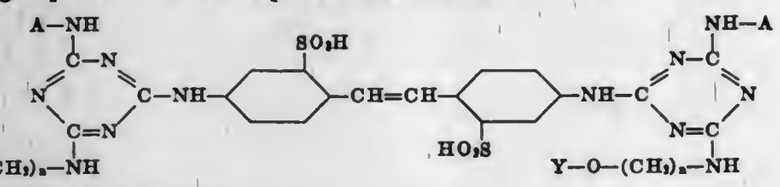
3,272,804
PROCESS AND INTERMEDIATES FOR PREPARING INDOLES

Sydney Archer, Bethlehem, N.Y., Charles Frederick Koelsch, St. Paul, Minn., and Roman R. Lorenz, and Benjamin F. Tullar, East Greenbush, N.Y., assignors to Sterling Drug Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Dec. 23, 1963, Ser. No. 332,949
22 Claims. (Cl. 260—240)

16. A compound of the formula

wherein AR together with the C=C group to which it is attached, represents pyrido-, pyrimido-, or quinolino-; R_1 represents a member of the group consisting of hydrogen, lower-alkyl, and phenyl; R_2 represents a member of the group consisting of hydrogen and lower-alkyl; R_3 represents a member of the group consisting of hydrogen and lower-alkyl; and Aryl represents a member of the group consisting of phenyl, m-tolyl, p-tolyl, α-naphthyl, and β-naphthyl.



17. N - (3 - methyl - 2 - pyridyl)-N'-methyl-N'-phenylformamidine.

3,272,805
BIS-TRIAZINYLAMINOSTILBENE COMPOUNDS

Heinrich Häusermann and Jakob Bindler, Riehen, Switzerland, assignors to J. R. Geigy A.G., Basel, Switzerland

No Drawing. Filed July 2, 1964, Ser. No. 380,033
Claims priority, application Switzerland, July 28, 1960, 8,637/60
6 Claims. (Cl. 260—240)

1. A compound of the formula

wherein

A represents a member selected from the group consisting of phenyl, 3-methylphenyl, 4-methylphenyl and 3-methoxyphenyl,

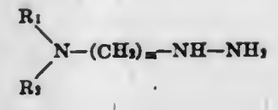
Y represents a member selected from the group consisting of methyl and ethyl, and

n is one of the integers 2 and 3.

3,272,806
4-(3,4-DIMETHOXYBENZYLIDENEAMINO) 6,7-DIMETHOXYQUINOLINE

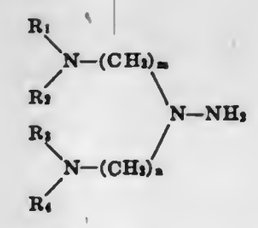
Alexander Winterstein, Norwich, N.Y., assignor to The Norwich Pharmacal Company, Norwich, N.Y., a corporation of New York

No Drawing. Filed Aug. 25, 1964, Ser. No. 392,046
1 Claim. (Cl. 260—240)



The compound 4-(3,4-dimethoxybenzylideneamino)-6,7-dimethoxyquinoline.

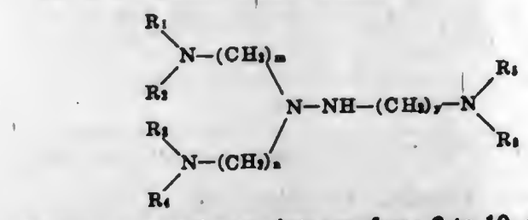
3,272,807
UNSYMMETRICAL DISUBSTITUTED AMINOALKYL HYDRAZINES



John H. Biel and Wallace K. Hoya, Milwaukee, Wis., assignors to Colgate-Palmolive Company, a corporation of Delaware

No Drawing. Filed Aug. 2, 1962, Ser. No. 214,196
14 Claims. (Cl. 260—243)

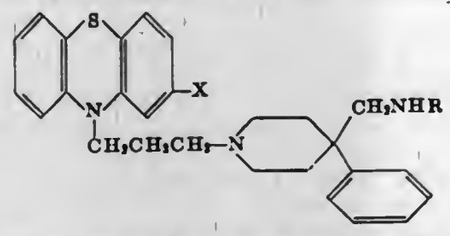
1. A member of the group of compounds consisting of compounds of the formulae



and

nontoxic pharmaceutically acceptable acid addition salts and nontoxic pharmaceutically acceptable quaternary ammonium salts of the group consisting of lower alkyl halides, phenyl-lower alkyl halides and lower alkyl sulfates thereof, wherein m and n are integers from 2 to 10, R_1 and R_2 are joined together to form a secondary amino group of the group consisting of morpholino, pyrrolidino, piperidino, 1,2,3,4-tetrahydroisoquinolino, 1,2,3,4-tetrahydroquinolino 4 - lower alkyl piperazino, 3 - hydroxypiperidino, 4-hydroxypiperidino and theophyllino, and R_3 and R_4 represent members of the group consisting of lower alkyl groups and the secondary amino groups represented by R_1 and R_2.

13. A compound of the formula



wherein m, n and y are integers from 2 to 10, and R_1 and R_2 are members of the group consisting of lower alkyl, phenyl, lower alkenyl, lower alkynyl, cyclopentyl and cyclohexyl groups and groups in which R_1 and R_2 are joined together to form a secondary amino group of the group consisting of morpholino, pyrrolidino, piperidino, 1,2,3,4-tetrahydroisoquinolino, 1.2,3,4-tetrahydroquinolino, isoindolino, 4-lower alkyl-1-piperazino, 3-hydroxypiperidino, 4-hydroxypiperidino, indolino, theophyllino and phenothiazino groups, R_3 and R_4 are members of the group consisting of lower alkyl, phenyl, phenyl-lower alkyl, lower alkenyl, lower alkynyl, cyclopentyl and cyclohexyl groups and groups in which R_3 and R_4 are joined together to form a secondary amino group of the group consisting of morpholino, pyrrolidino, piperidino, 1,2,3,4-tetrahydroisoquinolino, 1,2,3,4-tetrahydroquinolino, isoindolino, 4-lower alkyl-1-piperazino, 3-hydroxypiperidino, 4-hydroxypiperidino, indolino, theophyllino and phenothiazino groups, and R_5 and R_6 are members of the group consisting of lower alkyl, phenyl, lower alkenyl, phenyl-lower alkyl, lower alkynyl, cyclopentyl and cyclohexyl groups and groups in which R_5 and R_6 are joined together to form a secondary amino group of the group consisting of morpholino, pyrrolidino, piperidino, 1,2,3,4-tetrahydroisoquinolino, 1,2,3,4-tetrahydroquinolino, isoindolino, 4-lower alkyl-1-piperazino, 3-hydroxypiperidino, 4-hydroxypiperidino, indolino, theophyllino and phenothiazino groups.

3,272,808
N-[3-(4-AMINOMETHYL-4-PHENYLPIPERIDINO) PROPYL]PHENOTHIAZINES AND THEIR CARBAMATES

Harman S. Lowrie, Glenview, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Filed July 29, 1963, Ser. No. 298,431
4 Claims. (Cl. 260—243)

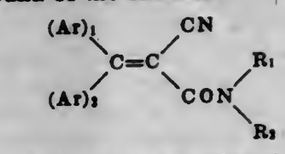
1. A compound of the formula

wherein X is selected from the group consisting of chlorine and lower alkanoyl and R is selected from the group consisting of hydrogen and (lower alkoxy)carbonyl.

3,272,809
CONVERSION OF 7-CARBOXYLIC ACYLAMINOCEPHALOSPORANIC ACID COMPOUNDS TO 7-ACA

Stephen Eardley, Ruislip, Middlesex, and Alan Gibson Long, Greenford, Middlesex, England, assignors to Glaxo Laboratories Limited, Greenford, England, a British company

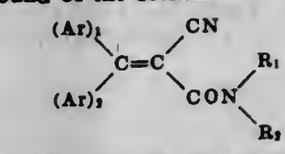
No Drawing. Filed Nov. 22, 1963, Ser. No. 325,741
Claims priority, application Great Britain, Nov. 23, 1962, 44,449/62
3 Claims. (Cl. 260—243)



1. In a process for the preparation of 7-aminocephalosporanic acid from 7-carboxylic acylaminocephalosporanic acid, the step which comprises reacting 7-carboxylic acylaminocephalosporanic acid in a solvent medium with boron trifluoride etherate, ethanol and ethyl orthoformate acting in combination as a source of carbonium ions.

3,272,810
α-CYANO-β,β-DIPHENYLACRYLAMIDE COMPOUNDS

Albert F. Strobel, Delmar, and Sigmund C. Catino, Castleton, N.Y., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

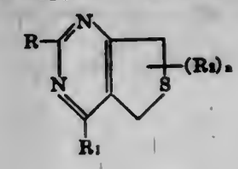


No Drawing. Filed May 1, 1962, Ser. No. 191,459
7 Claims. (Cl. 260—247.1)

1. A compound of the formula:

wherein $(Ar)_1$ and $(Ar)_2$ are phenyl nuclei devoid of nitro and nuclear-bonded amino groups and R_1 and R_2 are independently selected from the group consisting of alkyl of 1 to 30 carbon atoms, alkenyl of 3 to 25 carbon atoms and the atoms to complete a hetero ring with the nitrogen atom, said hetero ring being selected from the class consisting of mono- and bicyclic hetero nuclei.

4. A compound of the formula:



wherein $(Ar)_1$ and $(Ar)_2$ are phenyl nuclei devoid of nitro and nuclear-bonded amino groups and R_1 and R_2 form a heterocycle with the nitrogen atom, said heterocycle being selected from the group consisting of mono- and bicyclic heterocyclics.

3,272,811
DIHYDROTHIENO-[3,4-d]-PYRIMIDINES

Gerhard Ohnacker and Eberhard Woltun, Biberach an der Riss, Germany, assignors, by mesne assignments, to Boehringer Ingelheim G.m.b.H., Ingelheim (Rhine), Germany, a corporation of Germany

No Drawing. Filed June 17, 1963, Ser. No. 288,491
Claims priority, application Germany, July 4, 1962, T 22,407
14 Claims. (Cl. 260—247.1)

1. A compound selected from the group consisting of dihydrothieno-[3,4-d]pyrimidines of the formula

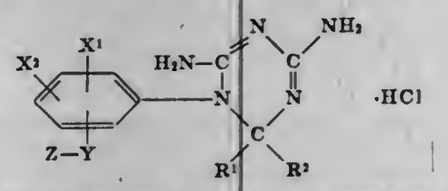
wherein

R is selected from the group consisting of hydrogen, lower alkyl, phenyl, benzyl, hydroxyl, lower alkoxy, mercapto, lower alkyl-mercapto, amino, mono-lower alkylamino, di-lower alkylamino, pyrrolidino, piperidino, morpholino, 2-lower alkyl-morpholino and N'-lower alkyl-piperazino,

R_1 is selected from the group consisting of halogen, hydroxyl, lower alkoxy, lower alkoxy-lower alkoxy, di-lower alkylamino-lower alkoxy, lower alkenyloxy, mercapto, lower alkyl-mercapto, amino, hydrazino, phenylhydrazino, mono-lower alkylamino, mono-lower alkenylamino, anilino, cyclohexylamino, phenyl-lower alkylamino, (di-lower alkylamino)-lower alkylamino, (lower alkoxy-lower alkyl)-amino, mono-(hydroxy-lower alkyl)-amino, di-(hydroxy-lower alkyl)-amino, (hydroxy-lower alkyl)-lower alkylamino, lower alkyl-

benzylamino, pyrrolidino, piperidino, morpholino, 2-lower alkyl-morpholino and N'-lower alkyl-piperazino,
R_2 is lower alkyl, and
n is an integer from 0 to 2, inclusive,
and their non-toxic, pharmacologically acceptable acid addition salts.

3,272,812
PREPARATION OF 1,3,5-TRIMETHYLHEXAHYDRO-s-TRIAZINE
James S. Dix and Marvin M. Johnson, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Sept. 27, 1963, Ser. No. 312,013
6 Claims. (Cl. 260—248)



1. A process for the preparation of 1,3,5-trimethylhexahydro-s-triazine which comprises bringing trimethylamine and an oxidizing reactant yielding oxygen together at elevated temperature for a short reaction time of the order of a number of milliseconds and then quenching the reaction mass thus obtained.

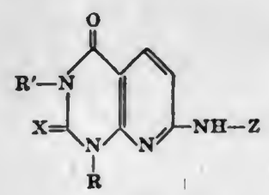
3,272,813
POTASSIUM DICHLORO- AND TRICHLORO-ISOCYANURATE COMPLEXES
William F. Symes, Webster Groves, Mo., assignor to Monsanto Company, a corporation of Delaware
No Drawing. Original application June 21, 1960, Ser. No. 37,565, now Patent No. 3,150,132, dated Sept. 22, 1964. Divided and this application Dec. 10, 1963, Ser. No. 329,388
5 Claims. (Cl. 260—248)

1. A process for preparing a crystalline, potassium containing chloroisocyanurate complex compound selected from the group consisting of [(mono-trichloro,) tetra-(monopotassium dichloro,)] penta-isocyanurate, (mono-trichloro,) (monopotassium dichloro,) di-isocyanurate and mixtures thereof which comprises the steps of bringing together and reacting mono-potassium dichloroisocyanurate and trichloroisocyanuric acid in an inert liquid in a reaction zone wherein the molecular ratio of monopotassium dichloroisocyanurate and trichloroisocyanuric acid is a molecular ratio in the range of 8:1 to 1.15:1 and isolating said crystalline, potassium containing, chloroisocyanurate complex compound.

3,272,814
4,6-DIAMINO-1-ARYL-1,2-DIHYDRO-s-TRIAZINES
Royal A. Cutler, Sand Lake, and Samuel Schallt, Albany, N.Y., assignors to Sterling Drug Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed Feb. 14, 1963, Ser. No. 258,653
18 Claims. (Cl. 260—249.9)

1. 4,6 - diamino - 1 - (aryl) - 1,2 - dihydro - 2 - (R^1)-2-(R^2)-s-triazine hydrochloride having the structural formula

where R^1 is a member of the group consisting of lower alkyl and hydroxy-lower alkyl, R^2 is a member of the group consisting of hydrogen and lower alkyl, X^1 is a member of the group consisting of hydrogen and lower alkyl, X^1 is a member of the group consisting of lower alkyl-S-, lower alkyl-SO-, lower alkyl-SO_2-, and halogen, X^2 is a member of the group consisting of hydrogen and halogen, Y is a member of the group consisting of —S—, —SO—, and —SO_2—, and Z is a member of the group consisting of lower alkyl, lower alkenyl, cyclohexyl, cyclopentyl, phenyl, lower alkylphenyl, halophenyl, nitrophenyl, halo-nitrophenyl, benzyl, ar-halobenzyl, ar-nitrobenzyl, and ar-halo-ar-nitrobenzyl.

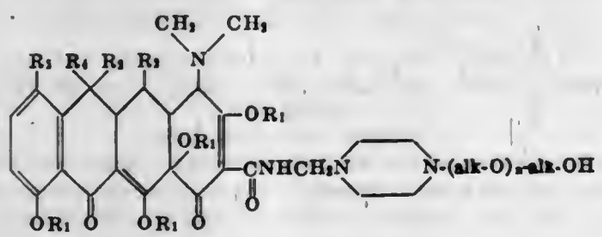


3,272,815
PROCESS FOR THE PRODUCTION OF DIENE ADDUCTS OF HEXAETHYLIDENE-CYCLOHEXANE
Heinrich Hopff, Kusnacht, near Zurich, and Geza Kormany, Buchs, near Aarau, Switzerland, assignors to J. R. Geigy A.-G., Basel, Switzerland
No Drawing. Filed Dec. 14, 1962, Ser. No. 244,551
Claims priority, application Switzerland, Dec. 20, 1961, 14,719/61
8 Claims. (Cl. 260—250)

7. Process for the production of diene adducts of hexaethylidene-cyclohexane which comprises:
(a) refluxing a mixture of hexaethylidene-cyclohexane with a philodiene selected from the group consisting of maleic acid, fumaric acid, maleic acid anhydride, maleic acid lower alkyl ester, fumaric acid lower alkyl ester, acrolein, crotonic aldehyde, acetylene dicarboxylic acid, acetylene dicarboxylic acid lower alkyl ester, benzoquinone, naphthoquinone, acrylic acid lower alkyl ester, acrylic acid, ethylene tetranitrile, azodicarboxylic acid dialkyl ester, and azodicarboxylic acid nitrile,
(b) and recovering the resulting adduct of two moles of said philodiene compound with each mole of hexaethylidene-cyclohexane from the reaction mixture.

8. An adduct of one mole of hexaethylidene-cyclohexane and two moles of a member selected from the group consisting of fumaric acid, maleic acid, maleic acid anhydride, maleic acid lower alkyl ester, fumaric acid lower alkyl ester, acetylene dicarboxylic acid, acetylene dicarboxylic acid lower alkyl ester, acrylic acid, and acrylic acid lower alkyl ester.

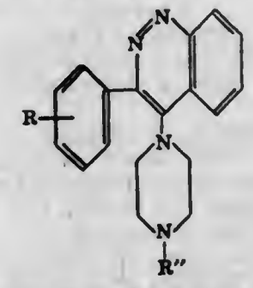
3,272,816
7-AMINO-2,4-DIOXO-1,2,3,4-TETRAHYDRO-PYRIDO[2,3-d]PYRIMIDINES
Viktor Papesch, Morton Grove, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware
No Drawing. Filed Apr. 28, 1965, Ser. No. 451,656
5 Claims. (Cl. 260—256.4)



1. A compound of the formula

wherein R is selected from the group consisting of lower alkyl, lower alkenyl, hydroxyethyl, and cyanoethoxyethyl; R' is selected from the group consisting of hydrogen and lower alkyl; X is selected from the group consisting of O and S; and Z is selected from the group consisting of hydrogen and lower alkanoyl.

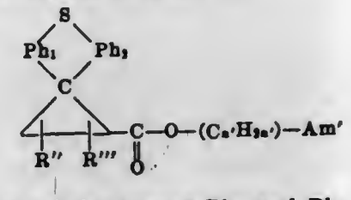
3,272,817
N-AMINOMETHYLTETRACYCLINE DERIVATIVES
Maxwell Gordon, Elkins Park, and Blaine M. Sutton, Philadelphia, Pa., assignors to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed Jan. 7, 1964, Ser. No. 336,119
3 Claims. (Cl. 260—268)



1. A compound having the following formula:

in which:
all of the R_1 groups are the same and are members selected from the group consisting of hydrogen, carbamoyl and lower alkanoyl;
R_2 is a member selected from the group consisting of hydrogen and hydroxy;
R_3 is a member selected from the group consisting of hydrogen, hydroxy, and, when R_1 is carbamoyl and lower alkanoyl, carbamoyloxy and lower alkanoyloxy, respectively;
R_4 is a member selected from the group consisting of hydrogen and methyl;
R_5 is a member selected from the group consisting of hydrogen, halogen, amino, nitro and trifluoromethylsulfonyl;
alk is an alkylene group having 2 to 4 carbon atoms; and
n is an integer of 1 to 2.

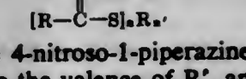
3,272,818
3-PHENYL-4-PIPERAZINYLCINNOLINES
Harman S. Lowrie, Glenview, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware
No Drawing. Filed July 13, 1964, Ser. No. 382,341
6 Claims. (Cl. 260—268)



1. A compound of the formula

wherein R is selected from the group consisting of hydrogen, methyl, methoxy, and chlorine; and R'' is selected from the group consisting of hydrogen, lower alkanoyl, carbethoxy, lower alkyl, hydroxyethyl, phenyl and benzyl.

3,272,819
AMINO ESTERS OF SPIRO (CYCLOPROPAN-1,9'-THIOXANTHENE)-2-CARBOXYLIC ACID
Renat Herbert Mizzoni, Long Valley, N.J., assignor to Ciba Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Dec. 16, 1963, Ser. No. 330,565
13 Claims. (Cl. 260—268)



1. A member selected from the group consisting of a compound having the formula

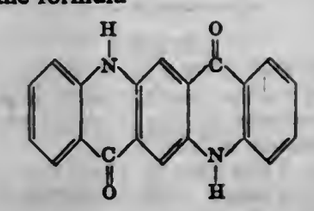
in which each of the groups Ph_1 and Ph_2 is a member selected from the group consisting of 1,2-phenylene, (lower alkyl)-1,2-phenylene, (lower alkoxy)-1,2-phenylene, (halogeno)-1,2-phenylene, and (trifluoromethyl)-1,2-phenylene, each of the groups R'' and R''' is a member selected from the group consisting of hydrogen and lower alkyl, the group of the formula —($C_{n'}H_{2n'}$)— is lower alkylene having from two to three carbon atoms and separating the group Am' from the oxygen atom by two to three carbon atoms, and Am' is a member selected from the group consisting of 1-N,N-lower alkyleneimino with four to six ring-carbon atoms, 4-lower alkyl-1-piperazino, 4-phenyl-1-piperazino and 4-morpholino, an acid addition salt, a quaternary lower alkyl-ammonium salt and a quaternary phenyl-lower alkyl-ammonium salt thereof.

3,272,820
4-NITROSO 1-PIPERAZINETHIOCARBOXYLATES
John J. D'Amico, Dunbar, W. Va., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Jan. 22, 1965, Ser. No. 427,473
13 Claims. (Cl. 260—268)

1. A compound selected from the group consisting of
(a) compounds of the formula

where R is the 4-nitroso-1-piperazine group, X is selected from the group consisting of oxygen and sulfur, one X being sulfur and the other oxygen, and R' is selected from the group consisting of alkali metal, ammonium, amine addition salt-forming group, and halogen-substituted benzyl, the halogen substituents being at least two but less than five and
(b) compounds of the formula

where R is the 4-nitroso-1-piperazine group, *n* is an integer equal to the valence of R', and R' is selected from a group consisting of metal, ammonium, amine addition salt-forming group, halogen-substituted benzyl, the halogen substituents being at least two but less than five,



and
when R is the same significance as before.

3,272,821
DELTA FORM OF QUINACRIDONE PIGMENT
Hans R. Schweizer, Herrliberg, Zurich, Switzerland, assignor, by mesne assignments, to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Apr. 26, 1962, Ser. No. 190,251
3 Claims. (Cl. 260—279)

1. A method for purifying linear quinacridones which comprises subliming crude linear unsubstituted quinacridone in a high vacuum within the range 0.05–0.1 mm. Hg and at temperatures within the range of 405–480° C.

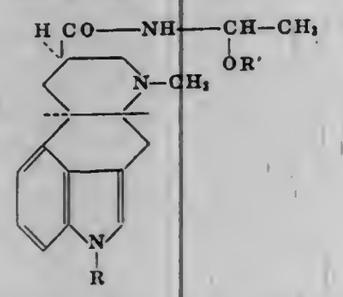
3. A new linear, unsubstituted, yellowish red quinacridone compound: 5,12-dihydroquino-(2,3-b)-acridine-7,14-dione, having the formula

possessing a new delta crystalline form and characterized by an X-ray diffraction pattern having a very strong line corresponding to an interplanar spacing of 13.6 A.; strong lines corresponding to interplanar spacings of 6.41 A. and 6.75 A.; medium lines corresponding to interplanar spacings of 3.34 A., 3.37 A. and 6.63 A.; and weak lines corresponding to interplanar spacings of 2.81 A., 2.95 A., 3.12 A., 3.18 A., 3.55 A., 3.74 A., 4.11 A., 4.36 A. and 5.23 A., wherein the relative intensity of the diffracted X-ray is measured with a Gieger counter.

3,272,822
POLYCHLOROQUINACRIDONE PIGMENTS
Ronald L. Sweet, Westfield, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Oct. 15, 1963, Ser. No. 316,447
2 Claims. (Cl. 260—279)

1. Octachloroquinacridonequinone.

2. Decachloroquinacridone characterized by being slightly soluble in concentrated sulfuric acid to form a dark green solution, said compound shows no change on heating to about 370° C. but blackens at about 400° C. without melting and exhibits a single X-ray diffraction peak with an interplanar spacing of 3.42 A.



3,272,823

α-HYDROXY DERIVATIVES OF DIHYDRO-D-LYSERGIC AND 1-METHYL-DIHYDRO-D-LYSERGIC ETHYLAMIDES

Federico Arcamone, Milan, Italy, and Aldo Ferretti, Washington, D.C., assignors to Società Farmaceutici Italia, Milan, Italy, a corporation of Italy

No Drawing. Filed Oct. 23, 1964, Ser. No. 406,190
Claims priority, application Italy, July 13, 1962, 14,099/62; Dec. 5, 1962, 23,917/62; Oct. 28, 1963, 22,092/63
18 Claims. (Cl. 260—285.5)

1. A compound of the formula:

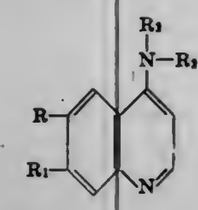
wherein

R' is selected from the group consisting of hydrogen; and methyl, and

R' is selected from the group consisting of hydrogen, β-(N-carbobenzoxy)-L-alanylhydrazide; cyclohexyl; substituted and unsubstituted saturated alkyl having from 1 to 4 carbon atoms

wherein the substituent is selected from the group consisting of hydroxy, alkoxy, chloro, phenyl, amino and acylamino

wherein the acyl is selected from the group consisting of saturated aliphatic carboxylic acid with from 1 to 4 carbon atoms, phenylcarbonic acid, benzoic acid, nicotinic acid and isonicotinic acid.



3,272,824

4-AMINO-6,7-DI(LOWER)ALKOXYQUINOLINES

Frank Frederick Ebetino and George Carlin Wright, Norwich, N.Y., assignors to The Norwich Pharmacal Company, a corporation of New York

No Drawing. Filed Dec. 6, 1962, Ser. No. 242,646
6 Claims. (Cl. 260—288)

1. A member of the group consisting of a base of the formula:

wherein

R and R_1 each represent a member of the group consisting of methoxy and ethoxy;

R_2 represents a member of the group consisting of hydrogen and methyl;

R_3 represents a member of the group consisting of hydrogen, amino, lower alkyl, hydroxy(lower)alkyl, lower alkoxy lower alkyl, carbethoxymethyl, amino(lower)alkyl, di(lower)alkylamino(lower)alkyl, acetyl, cyclohexyl, benzyl and phenyl; and R_2 and R_3 taken together represent the atoms necessary to complete a ring system chosen from the group consisting of morpholinyl and N-methylpiperazinyl, and the physiologically acceptable mineral acid addition salts thereof.

3,272,825

METHOD OF PRODUCING PYRIDINE

Akira Shimizu, Hirakata, Kiyonori Igarashi, Joto-ku, Osaka, and Junichi Hashimoto, deceased, late of Joto-ku, Osaka, Japan, by Shigako Hashimoto, executor, Shimizu, Japan, assignors to Koei Chemical Co., Ltd., Doshomachi, Higashi-ku, Osaka, Japan

No Drawing. Filed Dec. 9, 1963, Ser. No. 329,617
Claims priority, application Japan, Dec. 13, 1962, 37/56,921
5 Claims. (Cl. 260—290)

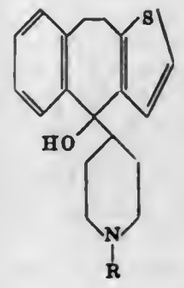
1. In a process for producing pyridine by heating a gaseous reaction mixture of formaldehyde, acetaldehyde and ammonia in the presence of a pyridine catalyst selected from the group consisting of silica, alumina, silica/alumina, and silica/magnesia, the improvement wherein the amount of acetaldehyde in the reaction mixture is from 2.2 to 3.5 moles per mole of formaldehyde.

3,272,826

SUBSTITUTED 4[PIPERIDYLIDENE(4')]-9,10-DIHYDRO-4H-BENZO [4,5] CYCLOHEPTA [1,2-b] THIOPHENE AND THE 4 PIPERIDYL 4 OL COMPOUNDS

Ernst Jucker, Ettingen, Basel-Land, Anton Ebnöther, Reinach, Basel-Land, André Stoll and Jean-Michel Bastian, Birsfelden, Basel-Land, and Erwin Rissi, Basel, Switzerland, assignors to Sandoz Ltd. (also known as Sandoz A.G.), Basel, Switzerland

No Drawing. Filed Aug. 29, 1963, Ser. No. 305,522
Claims priority, application Switzerland, Aug. 31, 1962, 10,377/62
7 Claims. (Cl. 260—293.4)



1. A compound selected from the group consisting of an antihistaminic thiophene of the formula:

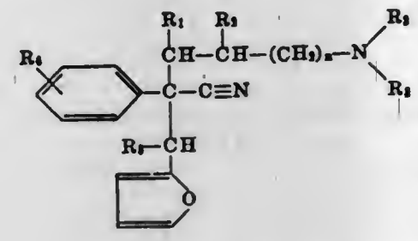
(I)

wherein R is a lower alkyl radical and the pharmaceutically acceptable acid addition salts of said thiophene.

4. A compound selected from the group consisting of an antihistaminic thiophene of the formula:

(III)

wherein R is a lower alkyl radical and the pharmaceutically acceptable acid addition salts of said thiophene.



3,272,827

α-PHENYL-β-(2-FURYL PROPIONITRILE COMPOUNDS AND A PROCESS OF MAKING SAME

Marcel Pesson, Paris, France, assignor to Societe anonyme dite: Laboratoire Roger Bellon, Neuilly-sur-Seine, Seine, France, a French company

No Drawing. Filed Oct. 7, 1964, Ser. No. 402,312
Claims priority, application Great Britain, Sept. 13, 1962, 35,021/62
15 Claims. (Cl. 260—294)

1. The α-phenyl-β-2-furyl propionitrile compound selected from the group consisting of an α-phenyl-β-2-furyl propionitrile of the formula

wherein:

R_1 and R_2 are members selected from the group consisting of hydrogen and lower alkyl;

R_3 and R_4 are members selected from the group consisting of lower alkyl and R_3 and R_4, together with the nitrogen atom to which they are attached, forming a saturated mononuclear heterocyclic ring;

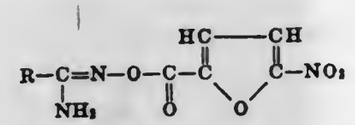
R_5 is a member selected from the group consisting of hydrogen, lower alkyl, and cyclohexyl;

R_6 is a member selected from the group consisting of hydrogen, chlorine, lower alkoxy, and phenoxy; and

n indicates one of the integers 0 and 1,

and its pharmaceutically acceptable acid addition salts.

14. The pharmaceutically acceptable acid addition salts of α-piperidino lower alkyl-α-phenyl-β-2-furyl-β-lower alkyl propionitrile.



3,272,828

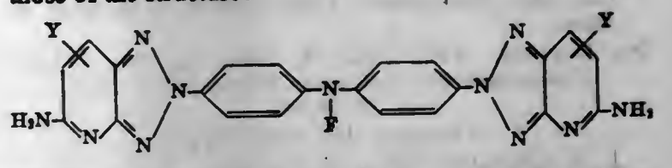
5-NITRO-2-FUROYLAMIDOXIMES

Anne Mary Von Esch, North Chicago, and Aldo J. Crovetti, Lake Forest, Ill., assignors to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois

No Drawing. Filed Oct. 9, 1963, Ser. No. 314,849
3 Claims. (Cl. 260—295)

3. A compound of the formula

wherein R is selected from the group consisting of pyridyl, furyl, thienyl, pyrimidyl, halofuryl, halothienyl, oxazyl, isoxazyl, quinolyl, pyrazyl, pyridylloweralkyl, furyllower-alkyl, thienylloweralkyl, imidazyl, pyrazinyl, thiazyl, and isoquinolyl.



3,272,829

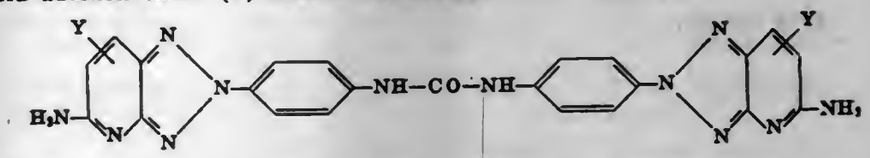
PYRIDOTRIAZOLE BRIGHTENERS

Bennett George Buell, Somerville, and Robert Sidney Long, Bound Brook, N.J., assignors to American Cyanamid Company, New York, N.Y., a corporation of Maine

No Drawing. Application Apr. 19, 1962, Ser. No. 188,897, now Patent No. 3,222,371, dated Dec. 7, 1965, which is a division of application Ser. No. 87,754, Feb. 8, 1961, which in turn is a division of application Ser. No. 698,930, Nov. 26, 1957, now Patent No. 3,058,989, dated Oct. 16, 1962. Divided and this application Aug. 25, 1964, Ser. No. 392,021
1 Claim. (Cl. 260—295)

A compound selected from the group consisting of (1) those of the structure:

wherein Y is selected from the group consisting of hydrogen, halogen, alkyl, carboxy, carbalkoxy and carboxamide, and F is selected from the group consisting of hydrogen and alkyl, and (2) quaternary salts of (1).



3,272,830

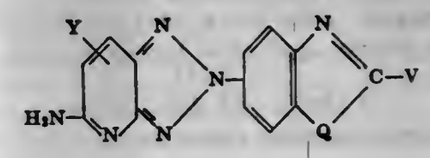
PYRIDOTRIAZOLE BRIGHTENERS

Bennett George Buell, Somerville, and Robert Sidney Long, Bound Brook, N.J., assignors to American Cyanamid Company, New York, N.Y., a corporation of Maine

No Drawing. Application Apr. 19, 1962, Ser. No. 188,897, now Patent No. 3,222,371, dated Dec. 7, 1965, which is a division of application Ser. No. 87,754, Feb. 8, 1961, which in turn is a division of application Ser. No. 698,930, Nov. 26, 1957, now Patent No. 3,058,989, dated Oct. 16, 1962. Divided and this application Aug. 25, 1964, Ser. No. 392,047
1 Claim. (Cl. 260—295)

A compound selected from the group consisting of (1) those of the formula:

wherein Y is selected from the group consisting of hydrogen, alkyl, halogen, carboxy, carbalkoxy and carboxamide, and (2) quaternary salts of (1).



3,272,831

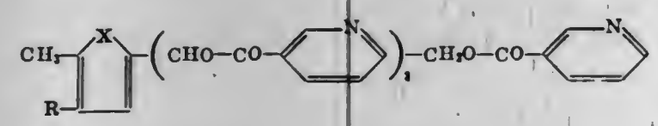
PYRIDOTRIAZOLE BRIGHTENERS

Bennett George Buell, Somerville, and Robert Sidney Long, Bound Brook, N.J., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Application Apr. 19, 1962, Ser. No. 188,897, now Patent No. 3,222,371, dated Dec. 7, 1965, which is a division of application Ser. No. 87,754, Feb. 8, 1961, which in turn is a division of application Ser. No. 698,930, Nov. 26, 1957, now Patent No. 3,058,989, dated Oct. 16, 1962. Divided and this application Aug. 25, 1964, Ser. No. 392,048
1 Claim. (Cl. 260—295)

A compound selected from the group consisting of (1) those of the structure:

wherein Y is selected from the group consisting of hydrogen, halogen, alkyl, carboxy, carbalkoxy and carboxamide, Q is selected from the group consisting of —O—, —NH— and —S— and V is selected from the group consisting of hydrogen, alkyl and aryl, and (2) quaternary salts of (1).



3,272,832

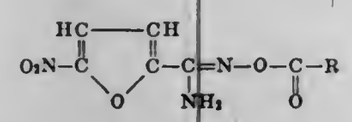
NICOTINIC ACID DERIVATIVES AND PROCESS FOR THE PREPARATION THEREOF

Hiroshi Nakano, Toyonaka, Akira Morimoto, Matsubara, Hideyuki Yoshimitsu, Kyoto, and Akira Kimata, Kyoto Prefecture, Japan, assignors to Fujisawa Pharmaceutical Co., Ltd., Doshomachi, Osaka, Japan, a company of Japan

No Drawing. Filed June 24, 1964, Ser. No. 377,483
Claims priority, application Japan, July 3, 1963, 38/34,982
9 Claims. (Cl. 260—295.5)

1. A compound having the formula

wherein X is oxygen or an imino radical, and R is a carboxyl, acid salt thereof, alkoxycarbonyl or carbamoyl, radical.



3,272,833

CERTAIN SUBSTITUTED 5-NITRO-2-FURYLAMIDOXIMES

Anne Mary Von Esch, North Chicago, and Aldo J. Crovetti, Lake Forest, Ill., assignors to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois

No Drawing. Filed Oct. 9, 1963, Ser. No. 314,875
6 Claims. (Cl. 260—295.5)

1. A compound of the formula

wherein R is selected from the group consisting of hydrogen, arylthioloweralkyl, aryllowerlkyl, aryloxyloweralkyl, carboloweralkoxyvinyl, diloweralkylamino, loweralkenyl, carboloweralkoxy, carboloweralkoxyloweralkyl, halophenyl, cyanoloweralkyl, loweralkoxyphenyl, hydroxyphenyl, loweralkylthiophenyl, nitrophenyl, aminophenyl, sulfonamidophenyl, halosulfonamidophenyl, pyridyl, furyl, thienyl, pyrimidyl, oxazyl, isoxazyl, quinolyl, pyrazyl, halofuryl, halothienyl, furylloweralkyl, thienylloweralkyl, imidazyl, pyrazinyl, thiazyl and isoquinolyl and non-toxic salts thereof.

3,272,834

DIISOPROPYL AMMONIUM NICOTINATE

Alfred Kraushaar and Kurt Riedl, Tyrol, Austria, assignors to Biochemie Gesellschaft mit beschrankter Haftung, Tyrol, Austria, a corporation of Austria

No Drawing. Filed Dec. 6, 1963, Ser. No. 328,515
Claims priority, application Austria, Dec. 14, 1962, A 9,797
1 Claim. (Cl. 260—295.5)

Diisopropylammonium nicotinate.

3,272,835

PROCESS FOR THE MANUFACTURE OF BIPYRIDYLS

Philip Brook Dransfield and Michael Hill Watson, Widnes, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain

No Drawing. Filed Nov. 6, 1963, Ser. No. 321,657
Claims priority, application Great Britain, Nov. 12, 1962, 42,616/62
25 Claims. (Cl. 260—296)

1. In a process for the manufacture of a bipyridyl by reaction of a metal selected from the group consisting of alkali metals and calcium and a pyridine to form a metal-pyridine interaction product and oxidizing said interaction product to bipyridyl, the improvement which comprises using a solution of said metal in liquid ammonia for reaction with the pyridine to form said interaction product.

3,272,836

PROCESS FOR THE MANUFACTURE OF BIPYRIDYLS

Roy Duffy and Alexander Hunter McQuillan, Widnes, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain

No Drawing. Filed Nov. 6 1963, Ser. No. 321,678
Claims priority, application Great Britain, Nov. 12, 1962, 42,617/62
11 Claims. (Cl. 260—296)

1. In a process for the manufacture of a bipyridyl by the reaction of a metal and a pyridine to form a metal-pyridine interaction product and oxidation of said inter action product to bipyridyl, the improvement which comprises carrying out siad reaction and oxidation simultaneously.

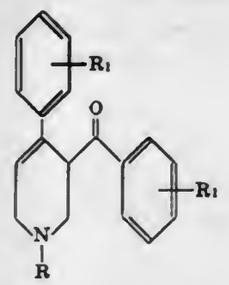
3,272,837

SUBSTITUTED TETRAHYDROPYRIDINES AND PROCESS THEREFOR

Marshall D. Draper, Woodland Hills, Calif., assignor to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware

No Drawing. Filed Oct. 30, 1964, Ser. No. 407,846
13 Claims. (Cl. 260—297)

1. 1-lower alkyl - 3 - (α - hydroxybenzyl) - 4 - phenyl-1,2,3,6-tetrahydropyridine.



3,272,838

SUBSTITUTED TETRAHYDROPYRIDINES

Marshall D. Draper, Woodland Hills, and Fred Keller, Northridge, Calif., assignors to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware

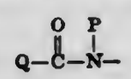
No Drawing. Filed Oct. 30, 1964, Ser. No. 407,861
7 Claims. (Cl. 260—297)

1. A compound of the formula

wherein R is a member selected from the group consisting of lower alkyl, lower alkenyl and phenyl-lower alkyl, and R_1 is a member selected from the group consisting of halo and low alkoxy.

3,272,839

SUBSTITUTED METHYLHYDRAZINE COMPOUNDS



Werner Bollag, Basel, Hugo Gutmann, Reinach, Balthasar Hegedus, Binningen, Ado Kaiser, Neu-Frenkendorf, Albert Langemann, Binningen, Marcel Muller, Reinach, and Paul Zeller, Allschwil, Switzerland, assignors to Hoffmann-La Roche Inc., Nutley, N.J., a corporation of New Jersey

No Drawing. Filed Apr. 20, 1965, Ser. No. 449,636
Claims priority, application Switzerland, Sept. 29, 1961, 11,355/61
16 Claims. (Cl. 260—304)

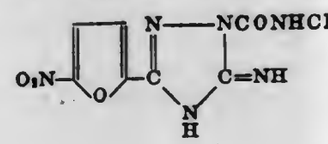
1. A compound selected from the group consisting of compounds of the formula

A—NH—NH—CH_3

and corresponding azo of the formula A—N=N—CH_3 and azoxy of the formula A—N(O)N—CH_3 compounds, and acid addition salts thereof; wherein A is selected from the group consisting of lower alkyl of up to 10 carbon atoms, lower alkenyl and cyclo-lower alkyl moieties substituted by at least one substituent selected from the group consisting of halogen, (2-methylhydrazino)-lower alkylamino-lower alkyl, lower alkylamino-lower alkoxy, di-lower alkylamino-lower alkoxy, allophanoyl, lower alkylallophanoyl, carbamoyl, lower alkylcarbamoyl, di-lower alkylcarbamoyl, N-phenylcarbamoyl, N-benzothiazolylcarbamoyl, N-(lower alkylthio-lower alkyl)-carbamoyl, N-(carbamoyl-lower alkyl)-carbamoyl, N-(lower alkyl-sulfonyl-lower alkyl)-carbamoyl, N-(halo-lower alkyl)-carbamoyl, N-(lower alkenyl)-carbamoyl, N-(phenyl-lower alkyl)-carbamoyl, N-furfuryl-carbamoyl, N-cyclo-lower alkylcarbamoyl, N-(lower alkylamino-lower alkyl)-carbamoyl, N-(di-lower alkylamino-lower alkyl)-carbamoyl, N-(2-methylhydrazino-lower alkyl)-carbamoyl, N,N-(lower alkylene)-carbamoyl, phthalimido, an acylamino moiety of the formula

wherein Q is selected from the group consisting of lower alkyl, phenyl, a monocyclic 5 to 6 membered heterocyclic ring moiety containing 1 to 2 heteroatoms selected from the group consisting of oxygen and nitrogen and wherein the heterocyclic moiety can bear a lower alkyl substituent; P is hydrogen or lower alkyl,

ureido, phenylureido, lower alkylureido, hydroxy-lower alkylureido, (2-methylhydrazino)-lower alkylureido, thioureido, guanidino, lower alkylguanidino, hydroxy-lower alkylguanidino, amidino, lower alkylamidino, di-lower alkylamidino, cyclo-lower alkylamidino, phenyl-lower alkylamidino, phenylamidino, isoxazoylamidino, lower alkanoyl, benzoyl, (2-methylhydrazino)-methyl, (2-methylhdrazino)-lower alkoxy and (2-methylhydrazino)-lower alkanoyl.



3,272,840

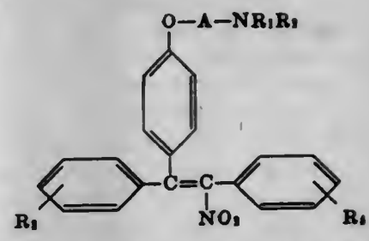
5 - IMINO - 1 - METHYLCARBAMOYL-3-(5-NITRO-2-FURYL)-Δ^2-1,2,4-TRIAZOLINE AND ITS PREPARATION

Louis Edmond Benjamin, Norwich, N.Y., assignor to The Norwich Pharmacal Company, a corporation of New York

No Drawing. Filed June 10, 1965, Ser. No. 463,030
2 Claims. (Cl. 260—308)

1. The compound 5-imino-1-methylcarbamoyl-3-(5-nitro-2-furyl)-Δ^2-1,2,4-triazoline of the formula:

2. The method of preparing 5-imino-1-methylcarbamoyl-3-(5-nitro-2-furyl)-Δ^2-1,2,4-triazoline which comprises reacting 5-imino - 3 - (5-nitro-2-furyl)-Δ^2-1,2,4-triazoline with methyl isocyanate.



3,272,841

α-(AMINOALKOXYPHENYL)-α'-NITROSTILBENE COMPOUNDS

Horace A. De Wald, Ann Arbor, Mich., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

No Drawing. Filed Mar. 23, 1964, Ser. No. 354,104
5 Claims. (Cl. 260—326.5)

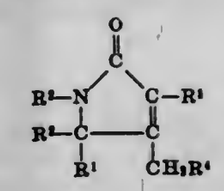
1. A member of the class consisting of compounds of the formula

and pharmaceutically-acceptable acid-addition and quaternary ammonium salts thereof, where A is a member of the class consisting of ethylene and propylene; R_1 and R_2 are members of the class consisting of lower alkyl and further members wherein R_1 and R_2 are combined and are selected from among

(a) oxydiethylene and

(b) lower alkylene of more than 3 and fewer than 9 carbon atoms, more than 3 and fewer than 6 of which are in annular position with the nitrogen atom;

and R_3 and R_4 are members of the class consisting of hydrogen, lower alkyl, lower alkoxy, halogen, and trifluoromethyl.



3,272,842

NOVEL PYRROLINONES

Nelson R. Easton and Robert D. Dillard, both of Indianapolis, Ind., assignors to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana.

No Drawing. Filed June 25, 1965, Ser. No. 467,106
6 Claims. (Cl. 260—326.5)

1. A compound of the formula

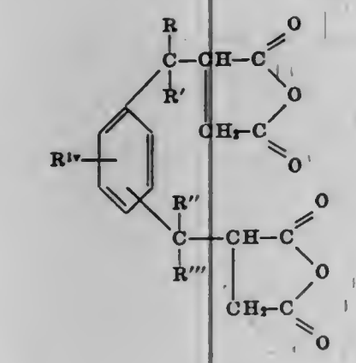
wherein

R^1 and R^2, when taken alone, are members of the group consisting of lower alkyl, phenyl, mono-substituted phenyl, and di-substituted phenyl, the substituents being of the group consisting of methyl, trifluoromethyl, and halo;

R^1 and R^2, when taken together with the carbon atom to which they are attached, complete a C_5–C_8 cycloalkyl ring;

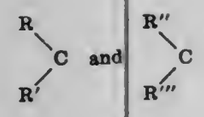
R^3 is a member of the group consisting of hydrogen, lower alkyl, C_5–C_6 cycloalkyl, lower-alkoxy-lower alkyl, and tetrahydrofurfuryl;

R^4 is a member of the group consisting of hydrogen, lower alkyl, phenyl, and naphthyl; and



R^5 is a member of the group consisting of phenyl, mono- and di-halo phenyl, phenoxy, mono- and di-halo phenoxy, phenylthio, mono- and di-halo phenylthio, naphthyl, mono- and di-halo naphthyl, naphthyloxy, mono- and di-halo naphthyloxy, naphthylthio, mono- and di-halo naphthylthio, and thienyl.

3,272,843
PHENYLENE-BIS-(3-BUTANE-1,2-DICARBOXYLIC ANHYDRIDES)

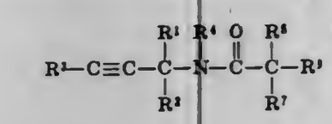


Sydney M. Spatz, Buffalo, and Russell I. Steiner, Williamsville, N.Y., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Feb. 1, 1961, Ser. No. 86,308
4 Claims. (Cl. 260—347.3)

1. Dianhydride having the structural formula:

in which



are alkylidene radicals each containing 2 to 6 carbon atoms and R^{iv} represents 4 nuclear substituents each selected from the group consisting of hydrogen and C_1–C_6 alkyl radicals.

3,272,844
NOVEL ACETYLENIC AMIDES

Nelson R. Easton and Robert D. Dillard, both of Indianapolis, Ind., assignors to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Filed June 3, 1965, Ser. No. 461,197
6 Claims. (Cl. 260—347.3)

1. A compound of the formula

wherein

R^1 and R^2, when taken alone, are members of the group consisting of lower alkyl, phenyl, and phenyl bearing not more than two substituents selected from the group consisting of methyl, trifluoromethyl, halo, and methoxy;

R^1 and R^2, when taken together with the carbon atom to which they are attached, complete a C_3–C_8 cycloalkyl ring;

R^3 is a member of the group consisting of hydrogen, lower alkyl, halo, phenyl, and naphthyl;

R^4 is a member of the group consisting of hydrogen, lower alkyl, C_3–C_6 cycloalkyl, lower-alkoxy-lower alkyl, and tetrahydrofurfuryl;

R^5 is a member of the group consisting of phenoxy-monosubstituted phenoxy, disubstituted phenoxy, phenylthio, monosubstituted phenylthio, disubstituted phenylthio, naphthyloxy, monosubstituted naphthyloxy, disubstituted naphthyloxy, naphthylthio, monosubstituted naphthylthio, disubstituted naphthylthio, the substituents being from the group consisting of methyl, trifluoromethyl, and halo;

R^6 and R^7 are members of the group consisting of hydrogen, methyl and ethyl.

3,272,845
BISGLYCIDYL ETHERS OF ISOHEXIDES

John D. Zech, Wilmington, and John W. Le Maistre, Claymont, Del., assignors to Atlas Chemical Industries, Inc., Wilmington, Del., a corporation of Delaware

No Drawing. Filed Mar. 21, 1963, Ser. No. 266,790
3 Claims. (Cl. 260—347.8)

1. Isosorbide bisglycidyl ether.

3,272,846
PROCESS FOR PRODUCING PHOSPHINYL AZIDES

Kazimiera J. L. Paciorek and Reinhold H. Kratzer, Costa Mesa, Calif., assignors to American Potash & Chemical Corporation, Los Angeles, Calif., a corporation of Delaware

No Drawing. Filed June 8, 1965, Ser. No. 462,422
6 Claims. (Cl. 260—349)

1. A process for preparing phosphinyl azides which comprises: admixing and reacting at a temperature of from about −15° C., to 150° C. a phosphinyl halide having the formula $R_2P(O)X$, and a silyl azide having the formula R_3SiN_3, for a period of time sufficient to produce a phosphinyl azide having the formula $R_2P(O)N_3$, wherein each R is a hydrocarbon group selected from the class consisting of lower alkyl groups containing from 1 to 5 carbon atoms, phenyl, and lower alkyl substituted phenyl groups containing from 7 to 10 carbon atoms, and X is a halogen selected from the group consisting of chlorine and bromine, and recovering said phosphinyl azide.

3,272,847
PROCESS FOR PREPARING EQUILIN AND THE INTERMEDIATES PRODUCED THEREIN

Douglas S. Irvine, Rosemere, Quebec, Jehan F. Bagli, Montreal, Quebec, Peter F. Morand, Ottawa, Ontario, Claude Vezina, Oka, Quebec, and Karel Wiesner, Westmount, Quebec, Canada, assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware

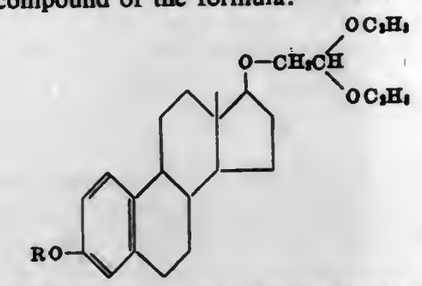
No Drawing. Filed Jan. 15, 1964, Ser. No. 337,753
17 Claims. (Cl. 260—397.3)

7. The method of deconjugating estra-4,6-diene-3,17-dione which comprises treating said estra-4,6-diene-3,17-dione with an alkali metal alkoxide in a solvent selected from the group which consists of dimethylsulfoxide, dimethylformamide, and methylsulfinyl anion in dimethyl sulfoxide.

3,272,848
PROCESS FOR THE PREPARATION OF EQUILIN

Douglas S. Irvine, Rosemere, Quebec, Jehan F. Bagli, Montreal, Quebec, Peter F. Morand, Ottawa, Ontario, Claude Vezina, Oka, Quebec, and Karel Wiesner, Westmount, Quebec, Canada, assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Jan. 20, 1964, Ser. No. 338,636
18 Claims. (Cl. 260—397.3)



8. The process of preparing androsta-1,4,7-triene-3,17-dione which comprises treating 17β-acetoxyandrosta-4,6-dien-3-one with acetic anhydride and acetyl chloride in an organic base, thereby obtaining its corresponding enol acetate, 3,17β-diacetoxyandrosta-3,5,7-triene; subjecting said last-named compound to base-catalysed selective hydrolysis, thereby obtaining 17β-hydroxyandrosta-4,7-diene-3-one; and treating said last-named compound with a microorganism selected from the group consisting of *Septomyxa affinis*, *Corynebacterium simplex* and *Bacillus sphaericus*, thereby obtaining androsta - 1,4,7-triene-3,17-dione.

3,272,849
17-DIETHOXYETHYL ETHERS OF 3-ALKOXY-1,3,5(10)-ESTRATRIENES

Gerhard R. Wendt, Havertown, and Kurt W. Ledig, Philadelphia, Pa., assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 1, 1965, Ser. No. 492,304
3 Claims. (Cl. 260—397.5)

1. A compound of the formula:

wherein R is a lower alkyl group having from 1 to 6 carbon atoms.

3,272,850
DEODORIZATION OF LANOLIN AND LANOLIN DERIVATIVES

Thomas B. Richey, Jr., Westfield, N.J., and Conrad J. Sunde, Garden City, N.Y., assignors to Malmstrom Chemical Corporation, Newark, N.J., a corporation of New Jersey

No Drawing. Filed June 14, 1963, Ser. No. 287,798
13 Claims. (Cl. 260—428)

1. A process for deodorizing a lanolin material selected from the group consisting of lanolin, lanolin oil, wool wax alcohols, lanolin wax fractions, ethoxylates of each of the foregoing, and esterified lanolins, which comprises continuously feeding said lanolin material into contact with the inner wall of a heated jacket, causing the feed material to flow downwardly along the surface of said wall to be heated thereby while in the form of a wiped film of relatively minute thickness, said film being formed by a wiping action which imparts turbulence to said film and causes it to spiral as it flows downwardly along said surface, subjecting said film to a vacuum in the range of from 0.5 to 100 mm. mercury absolute while thus heated, and simultaneously subjecting the thus heated film to the action of a countercurrent flow of steam.

3,272,851
PURIFICATION OF ACYLATED LANOLIN PRODUCTS

Conrad J. Sunde, Garden City, N.Y., and Thomas B. Richey, Jr., Westfield, N.J., assignors to Malmstrom Chemical Corp., Newark, N.J., a corporation of New Jersey

No Drawing. Filed July 24, 1963, Ser. No. 297,196
13 Claims. (Cl. 260—428)

1. The method of purifying reaction products resulting from acylation of a lanolin material and having a hydroxyl value of from about 15 to about 150, said material being selected from the group consisting of lanolin, lanolin oil, lanolin wax, lanolin fatty acids, wool grease acids, lanolin alcohols, wool grease alcohols, ethoxylated lanolin, ethoxylated lanolin alcohols, ethoxylated lanolin wax and lanolin derivatives containing amine groups, said method comprising continuously feeding said products of acylation into contact with the surface of the inner wall of a heated jacket, causing the feed material to flow downwardly along the surface of said wall to be heated thereby while in the form of a wiped film of relatively minute thickness, said film being formed by a wiping action which imparts turbulence to said film and causes it to spiral as it flows downwardly along said surface, subjecting said film to a vacuum in the range of from about 1.0 to about 50 mm. mercury absolute, while thus heated, and simultaneously subjecting the thus flowing heated film to the action of a counter-current flow of steam, whereby to remove excess acylating agent and simultaneously eliminate odoriferous constituents from said products.

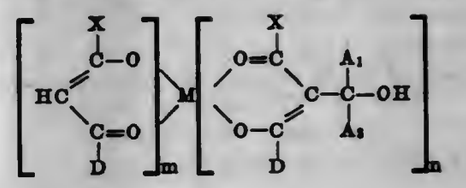
3,272,852
SCHIFF BASE-INORGANIC HALIDE ADDUCT

Frederic C. McCoy, Beacon, and Edwin C. Knowles, Poughkeepsie, N.Y., assignors to Texaco Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Sept. 10, 1963, Ser. No. 307,791
10 Claims. (Cl. 260—429.5)

1. A novel composition represented by the formula:

in which R is an alkyl radical having from 1 to 30 carbon atoms, R′ is selected from the group consisting of hydrogen and an alkyl radical having from 1 to 18 carbon atoms, the sum of the carbon atoms in R and R′ being at least 12, y is an integer from 1 to 6, M is a polyvalent cation selected from the class consisting of boron, aluminum, titanium, tin, zinc, copper, cadmium, magnesium, mercury, zirconium, antimony, manganese and iron, X is a halide ion selected from the group consisting of chloride, bromide and iodide ions and in the case of divalent tin and the cations having a valence of 3 to 4 the fluoride ion, and z is an integer from 2 to 4 equal to the valence of M.



2. A composition according to claim 1 in which M is titanium.

3,272,853
METAL CHELATES CONTAINING PERHALOALKYL GROUPS

Robert A. Braun, Newark, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Apr. 9, 1963, Ser. No. 271,579
10 Claims. (Cl. 260—438.1)

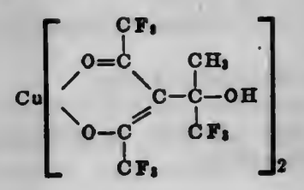
1. A compound having the formula

where

A_1 and A_2 are selected from the group consisting of perchloroalkyl, perfluoroalkyl and mixed perchlorofluoroalkyl radicals all containing 1 through 5 carbon atoms;

X is selected from the group consisting of alkyl radicals containing 1 through 5 carbon atoms; perchloroalkyl, perfluoroalkyl and mixed perchloro-fluoroalkyl radicals all containing 1 through 5 carbon atoms, aryl radicals; —OCH_3, —Cl, —CH_3, and —NO_2 substituted aryl radicals; and thienyl;

D is selected from the group consisting of X and —OX;



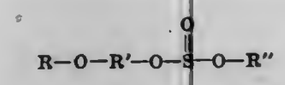
M is a metal having a valence of 2–4;

n is a number 1–4; and

m is a number 0–3;

provided, however, that the sum of n and m cannot exceed the valence number of the metal.

4. A compound of the formula

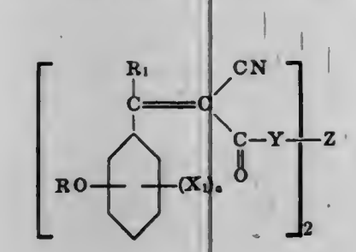


3,272,854
CYCLOALIPHATIC SULFITE ESTERS

Rupert A. Covey, Wolcott, Allen E. Smith, Oxford, and Winchester L. Hubbard, Woodbridge, Conn., assignors to United States Rubber Company, New York, N.Y., a corporation of New Jersey

No Drawing. Filed July 18, 1963, Ser. No. 296,107
9 Claims. (Cl. 260—456)

1. A compound represented by the formula



in which R has not more than 18 carbon atoms and is selected from the group consisting of alkyl, alkenyl, alkynyl having from 3 to 10 carbon atoms, cycloalkyl, alkoxycycloalkyl, chloroalkyl, bromoalkyl, cyanoalkyl, phenyl, naphthyl, phenyl and naphthyl having substituents selected from the group consisting of alkyl, cycloalkyl, chloroalkyl, bromoalkyl, alkoxy, chloro, bromo and nitro, R'' has not more than 18 carbon atoms and is selected from the group consisting of alkyl, alkenyl, alkynyl having from 3 to 10 carbon atoms, cycloalkyl, alkoxycycloalkyl, chloroalkyl, bromoalkyl, cyanoalkyl, alkoxyalkyl, carbalkoxyalkyl, phenyl, naphthyl, phenyl and naphthyl having substituents selected from the group consisting of alkyl, cycloalkyl, chloroalkyl, bromoalkyl alkoxy and chloro, bromo, and R' has not more than 12 carbon atoms and is a divalent cycloaliphatic radical having from 4 to 8 ring carbons in which the two valences are on two different carbon atoms selected from the group consisting of cycloalkylene, alkyl substituted cycloalkylene and alkenyl substituted cycloalkylene.

3,272,855
BIS-α-CYANO-β-SUBSTITUTED CINNAMIC ACID AMIDES AND ESTERS

Albert F. Strobel, Delmar, and Sigmund C. Catino, Castleton, N.Y., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed July 27, 1962, Ser. No. 213,002
The portion of the term of the patent subsequent to Dec. 18, 1979, has been disclaimed
14 Claims. (Cl. 260—465)

1. A colorless compound of the formula:

wherein:

R is selected from the group consisting of hydrogen alkyl, alkenyl, benzyl and phenyl radicals;

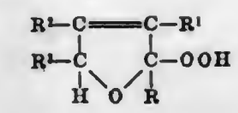
R_1 is selected from the group consisting of alkyl of 1 to about 30 carbon atoms and alkenyl of 3 to about 30 carbon atoms;

X_1 is a non-auxochrome having a bathochromism of less than 250 A;

n is an integer from 0 to 4;

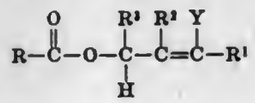
Y is selected from the group consisting of —O— and —N—R_2;

R_2 is selected similarly as R and



Z is a bivalent radical, selected from the group consisting of lower alkylene, cyclohexylene, phenylene, and xylylene radicals.

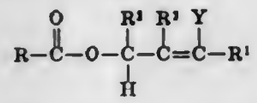
3,272,856
PREPARATION OF HALO AND ALKYL-THIO SUBSTITUTED ALLYL ESTERS



John B. Braunwarth, Crystal Lake, Ill., assignor, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Dec. 30, 1963, Ser. No. 334,628
20 Claims. (Cl. 260—488)

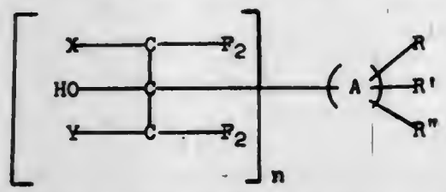
1. The method which comprises reacting a peroxide compound of the formula



wherein R, R^1, R^2 and R^3 are substituents of the group consisting of hydrogen and C_1 to C_5 alkyl, with a reactant of the group consisting of polyhalomethane compounds of the formula CH_nX_{4-n} wherein X is halogen of the group consisting of chlorine, bromine and iodine, combinations thereof and fluorine when at least one of the other halogens is present in the molecule and *n* is an integer of 0 to 1, chlorine, bromine, iodine, hydrogen chloride, hydrogen bromide, hydrogen iodide and mercaptans of the formula R^4SH wherein R^4 is C_1–C_5 alkyl, in the presence of redox reducing agent and separating allyl ester products fo the formula

wherein R, R^1, R^2 and R^3 are as above defined and Y is a member of the group consisting of chlorine, bromine, iodine, the group —CX_3 wherein X is halogen and the group —SR^4 wherein R^4 is as above defined.

12. Allyl esters of the formula



wherein R, R^1, R^2 and R^3 are substituents of the group consisting of hydrogen and C_1–C_5 alkyl, Y is a member of the group consisting of chlorine, bromine, iodine, the group —CX_3 wherein X is halogen and the group —SR^4 wherein R^4 is C_1–C_5 alkyl.

3,272,857
PROCESS FOR THE PREPARATION OF AROMATIC CARBOXYLIC ACIDS

Basil S. Farah and Everett E. Gilbert, Morris Township, Morris County, Edward S. Jones, Hanover Township, Morris County, and Julian A. Otto, Stockholm, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Dec. 30, 1963, Ser. No. 334,639
12 Claims. (Cl. 260—516)

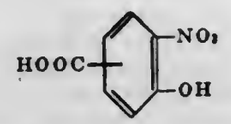
1. A process for the preparation of an aromatic carboxylic acid which comprises admixing a hexahalohydroxyisopropyl aryl derivative of the formula

wherein X and Y are halogens independently selected from the group consisting of chlorine and fluorine, *n* is an integer from 1 to 2, A is an aryl radical, R, R' and R'' are members independently selected from the group consisting of hydrogen, alkyl, alkoxy, hydroxy, amino, dialkylamino and halogen with an alkali metal hydroxide, heating the resulting reaction mixture to a temperature of from about 100° C. to the boiling point of the reaction mixture, acidifying the reaction mixture and recovering the resulting aromatic carboxylic acid.

3,272,858
METHOD OF PRODUCING ARYLAMINO ACID COLOR COUPLERS

Gerald Noel White, Carshalton, Surrey, England, assignor to The Pavelle Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Mar. 23, 1962, Ser. No. 182,082
8 Claims. (Cl. 260—518)



1. A method of producing aryl amino acid color couplers consisting essentially of condensing malonic dialkyl esters selected from the group consisting of malonic dialkyl esters having alkyl groups containing from 1 to 5 carbon atoms with an aryl amino ester chosen from the group consisting of p-aminobenzoic methyl and ethyl esters, 5-amino isophthalic methylester, and 2-methoxy-4-amino benzoic ethyl ester and subjecting the condensation product to hydrolysis at a temperature of between 60° C. and 80° C.

3,272,859
PREPARATION OF HYDROXYNITRO-BENZOIC ACIDS

Henry J. Peterson, Wilmington, Del., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed Nov. 12, 1963, Ser. No. 323,070
4 Claims. (Cl. 260—521)

1. Method for preparing hydroxynitrobenzoic acids having the general formula

wherein the carboxyl radical occurs other than ortho to the nitro radical, which comprises contacting a mono-nitrotoluene selected from the group consisting of meta- and para-nitrotoluene with a weight percent excess of powdered potassium hydroxide at a temperature in the range of 0° C. to about 100° C., for a period of time in the range of 0.1 hour to 72 hours whereby the mono-nitrotoluene is converted to dipotassium salt of hydroxynitrobenzoic acid, acidifying said salt in aqueous solution with mineral acid, and thereafter separating and recovering said hydroxynitrobenzoic acid.

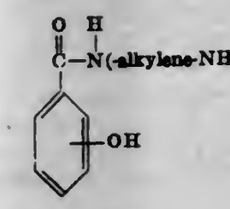
3,272,860
PREPARATION OF METHIONINE ANALOGUES

Hans L. Nufer, St. Louis, Mo., assignor to Monsanto Company, a corporation of Delaware

No Drawing. Filed Apr. 2, 1964, Ser. No. 356,946
4 Claims. (Cl. 260—535)

1. The process of preparing high quality monomeric calcium 2-hydroxy-4-(methylthio)butyrate which comprises contacting an aqueous solution of 2-hydroxy-4-(methylthio)butyric acid with a calcium compound of the group consisting of calcium oxide and calcium hydroxide in the presence of a compound of the structure

$$R—OCH_2CH_2—OH$$



wherein R is an alkyl group having one to four carbon atoms and filtering the resulting slurry of the monomeric calcium 2-hydroxy-4-(methylthio)butyrate.

3,272,861
POLYALKYLENE POLYAMINE DERIVATIVES OF HYDROXYBENZOIC ACID

Olen L. Riggs, Jr., Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

No Drawing. Filed Aug. 23, 1962, Ser. No. 218,815
4 Claims. (Cl. 260—559)

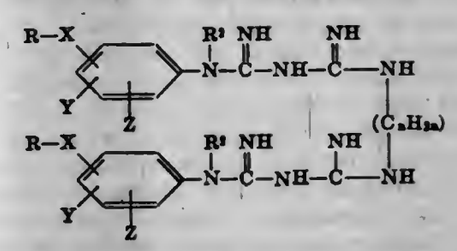
1. A hydroxybenzamide of the formula

wherein the alkylene radical is selected from the group consisting of ethylene and trimethylene groups and *x* is an integer varying from 2 to 4.

3,272,862
RECOVERY OF TETRACYCLINE ANTIBIOTICS FROM FERMENTATION BROTHS

Ezio Caputo and Enzo Zanaini, Milan, Italy, assignors to Ankerfarm S.p.A., Milan, Italy, a corporation of Italy

No Drawing. Filed Dec. 9, 1963, Ser. No. 329,298
Claims priority, application Italy, Oct. 19, 1963, 21,463/63
11 Claims. (Cl. 260—559)



1. A process for the recovery of a tetracycline antibiotic selected from the group consisting of tetracycline, 7-chlortetracycline, and 5-oxytetracycline from a fermentation broth which comprises filtering the broth free of mycelia, adjusting the pH of the broth to a pH of between 0.5 and 6.0, adding cupric ions and a surface active agent to precipitate a cupric complex of the tetracycline antiobiotic, separating by filtration said cupric complex of the tetracycline antibiotic, dissolving said precipitate of said cupric complex of the tetracycline antibiotic in an organic solvent which is immiscible with water, and removing the cupric ions from said dissolved cupric complex of the tetracycline antibiotic by aqueous extraction of said organic solution with an aqueous solution of a chelating agent which has a greater propensity for the cupric ions than does the tetracycline antibiotic and which removes the cupric ions into said aqueous solution, whereby a solution of the tetracycline antibiotic in said organic solvent is obtained.

3,272,863
1,1'-(ALKYLENE)BIS(5-ARYLBIGUANIDES)

Royal A. Cutler, Sand Lake, and Samuel Schalit, Albany, N.Y., assignors to Sterling Drug Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 27, 1964, Ser. No. 355,478
18 Claims. (Cl. 260—565)

1. A compound of the group consisting of: 1,1'-(alkylenebis(5-arylbiguanides) having the formula

wherein: C_nH_{2n} represents a bivalent alkylene bridge in which the free valence bonds are on two different carbon

atoms and *n* is an integer from 2 to 12 inclusive; R^2 is a member of the group consisting of hydrogen and alkyl containing 1–4 carbon atoms; Y is a member of the group consisting of hydrogen, halogen, trifluoromethyl, nitro, lower alkyl —O—, lower alkyl —S—, lower alkyl —SO—, and lower alkyl —SO_2—; Z is a member of the group consisting of hydrogen, halogen, nitro, lower alkyl, and lower alkyl —O—; R is a member of the group consisting of alkyl containing 1–18 carbon atoms, halo-lower alkyl, lower alkenyl, benzyl, ar-halobenzyl, ar-nitrobenzyl, ar-lower alkylbenzyl, ar-lower alkoxybenzyl, cyclohexyl, phenyl, lower alkylphenyl, nitrophenyl, lower alkoxyphenyl, halophenyl, and, when neither of Y and Z is nitro, the further members ar-aminobenzyl and aminophenyl; and X is a member of the group consisting of —S—, —SO—, and —SO_2—; and acid-addition salts thereof.

3,272,864

PROCESS FOR PREPARING 5-(3-AMINOPROPYLIDENE)-5H-DIBENZO[a,d]CYCLOHEPTENE AND 5H - DIBENZO[a,d]-10,11-DIHYDRO - CYCLOHEPTENE DERIVATIVES

Robert D. Hoffsommer, Jr., and David Taub, Metuchen, and Norman L. Wendler, Summit, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Apr. 19, 1962, Ser. No. 188,873
5 Claims. (Cl. 260—570.8)

1. A method of introducing a γ-aminopropylidene moiety at the 5 position of a 5H-dibenzo[a,d]-10,11-dihydrocycloheptene or a 5H-dibenzo[a,d]cycloheptene, which comprises reacting a compound selected from the group consisting of a 5H-dibenzo[a,d-]-10,11-dihydrocycloheptene-5-one and a 5H-dibenzo[a,d]cycloheptene-5-one with a Grignard reagent derived from a cyclopropylhalide to produce the corresponding intermediate selected from the group consisting of 5-cyclopropyl-5-hydroxy-5H-dibenzo[a,d] - 10,11 - dihydrocycloheptene and 5-cyclopropyl - 5 - hydroxy-5H-dibenzo[a,d]cycloheptene, rearranging said intermediate to form the corresponding 5-(γ-hydroxypropylidene) - 5H - dibenzo-[a,d]-10,11-dihydrocycloheptene and 5-(γ-hydroxypropylidene) - 5H - dibenzo[a,d]cycloheptene, halogenating said derivative to the corresponding 5-(γ-halopropylidene)-5H-dibenzo[a,d]-10,11-dihydrocycloheptene and 5-(γ-halopropylidene) - 5H - dibenzo[a,d]cycloheptene, and then aminating said halogen derivative to the amine compound.

3,272,865

PREPARATION OF AMINATED BENZENES FROM HYDROXY BENZENES

Robert S. Barker, Port Washington, N.Y., assignor to Halcon International, Inc., a corporation of Delaware

No Drawing. Filed Aug. 10, 1962, Ser. No. 216,063
6 Claims. (Cl. 260—581)

1. A process for the preparation of an aminated benzene which comprises: contacting an aminating agent selected from the group consisting of ammonia, ammonium chloride, ammonium carbonate, methylamine, aniline, N-methyl aniline, and an hydroxybenzene selected from the group consisting of phenol and derivatives thereof having from 1 to 3 ring hydrogens replaced by a radical selected from the group consisting of aromatic and aliphatic hydrocarbon radicals having from 1 to 6 carbon atoms in the presence of a catalyst selected from the group consisting of silica-alumina having from 10 to 20% silica, silica-alumina having from 10 to 20% alumina, zirconia-alumina, titania-alumina, phosphoric acid and tungsten oxide, at a temperature between 300 and 600° C. and pressures in excess of 7 atmospheres; and withdrawing a stream containing an aminated benzene.

3,272,866

PROCESS FOR CATALYTIC HYDROGENATION OF ADIPONITRILE

John W. Conner, Phillip W. Evans, Albert J. Isacks, Jr., and Chester P. Nieswender, Jr., Pensacola, Fla., assignors to Monsanto Company, a corporation of Delaware

No Drawing. Filed Apr. 3, 1963, Ser. No. 270,160
5 Claims. (Cl. 260—583)

1. A process for catalytically hydrogenating adiponitrile to produce hexamethylenediamine comprising contacting, at a temperature between 25° C. and 200° C. and at a pressure between 25 and 10,000 pounds per square inch, a mixture comprising adiponitrile, ammonia, and hydrogen with a hydrogenation catalyst selected from the group consisting of cobalt and nickel prepared from a corresponding oxide, said oxide having magnetic properties when subjected to a mangetic field of intensity between 200 gauss and 10,000 gauss.

3,272,867

PROCESS FOR CATALYTIC HYDROGENATION OF ADIPONITRILE

John W. Conner, Phillip W. Evans, Albert J. Isacks, Jr., and Chester P. Neiswender, Jr., Pensacola, Fla., assignors to Monsanto Company, a corporation of Delaware

No Drawing. Filed Apr. 3, 1963, Ser. No. 270,161
5 Claims. (Cl. 260—583)

1. A process for catalytically hydrogenating adiponitrile to produce hexamethylenediamine comprising contacting, at a temperature between 25° C. and 200° C. and at a pressure between 25 and 10,000 pounds per square inch, a mixture comprising adiponitrile, ammonia, and hydrogen with hydrogenation catalyst selected from the group consisting of cobalt and nickel prepared from a corresponding oxide, said oxide having nonmagnetic properties when subjected to a magnetic field of intensity between 200 gauss and 10,000 gauss.

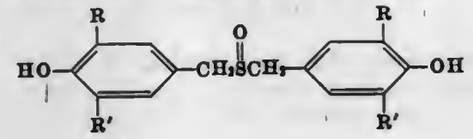
3,272,868

INTERMITTENT WATER VAPOR ADDITION DURING FORMALDEHYDE SYNTHESIS

Alvin B. Stiles, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Oct. 2, 1964, Ser. No. 403,689
5 Claims. (Cl. 260—603)

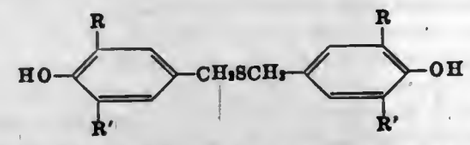
1. In the process of oxidatively dehydrogenating methanol to make formaldehyde by passing a mixture of methanol vapor, water vapor, and air over a catalyst, wherein the amount of methanol vapor in the feed is in the range of about 50 to 100 volume percent based on the volume of air, the improvement which comprises operating normally at a feed humidity of about 8 to 12% by weight of water based on methanol, and intermittently raising and lowering the water content of the feed so as to operate at a feed humidity of about 16–20% by weight of water based on methanol during a total of about 0.5% to 20% of the time.



3,272,869

ORGANIC SULFIDE AND SULFOXIDE ANTIOXIDANTS AND METHOD FOR THEIR PREPARATION

Francis X. O'Shea, Wolcott, Conn., assignor to the United States Rubber Company, New York, N.Y., a corporation of New Jersey



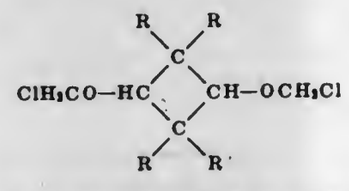
No Drawing. Filed May 25, 1960, Ser. No. 31,542
6 Claims. (Cl. 260—607)

1. The bis-(3,5-dihydrocarbyl-4-hydroxybenzyl)sulfoxides as represented by the structural formula:

wherein R is selected from the group consisting of alkyl, cycloalkyl and aralkyl radicals containing less than 13 carbon atoms and R' is selected from the group consisting of tert-alkyl, cycloalkyl and aralkyl radicals containing less than 13 carbon atoms.

3. A method of preparing bis-(3,5-dihydrocarbyl-4-hydroxybenzyl)sulfides as represented by the structural formula:

wherein R is selected from the group consisting of alkyl, cycloalkyl, and aralkyl radicals containing less than 13 carbon atoms and R' is selected from the group consisting of tert-alkyl, cycloalkyl and aralkyl radicals containing less than 13 carbon atoms, comprising reacting one molar proportion of a 2,6-dihydrocarbylphenol with one to about three molar proportions of formaldehyde and one-half to about two molar proportions of a compound selected from the group consisting of alkali metal sulfide and hydrosulfide and in a solvent selected from the group consisting of lower alkanols and ethylene glycol monoethyl ether at a temperature of from about 25° C. to about 150° C. for a period of from about 0.5 to about 24 hours.



3,272,870

CYCLOBUTANE DERIVATIVES

John R. Caldwell and Winston J. Jackson, Jr., Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Apr. 23, 1962, Ser. No. 189,308
6 Claims. (Cl. 260—611)

1. A cyclobutane derivative of the formula:

wherein each R is independently selected from the group consisting of (a) lower alkyl radicals and (b) nuclear members of saturated 5–6 carbon atom rings comprising an adjacent R as a nuclear member.

3,272,871

FLUOROCARBON-HYDROCARBON POLYETHERS

Joseph Leo Warnell, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

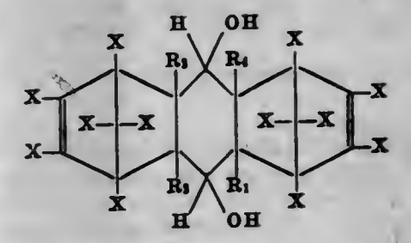
No Drawing. Filed Feb. 1, 1962, Ser. No. 170,499
5 Claims. (Cl. 260—615)

1. A fluorocarbon-hydrocarbon polyether having the formula

$$RO\{CF_2—CF_2—O\}_nR'$$

where *n* is the number of divalent tetrafluoroethylene epoxide units in the polyether and is from one to 20, and R and R' are radicals selected from the class consisting of alkyl radicals and alkoxy substituted alkyl radicals, said radicals having from one to 6 carbon atoms.

5. The process of preparing a fluorocarbon-hydrocarbon polyether having the formula $RO(CF_2—CF_2—O)_nR'$ wherein *n* is the number of divalent tetrafluoroethylene epoxide units in said polyether and is from one to 20 and R and R' are radicals selected from the class consisting of alkyl radicals and alkoxy substituted alkyl radicals, said radicals having from one to 6 carbon atoms, said process consisting essentially of reacting tetrafluoroethylene epoxide with a hydrocarbon ether having the formula ROR', wherein R and R' have the same meaning as previously stated in this claim, at a temperature of —80 to +50° C.



3,272,872

HALOGENATED 1,4:5,8-DIMETHANOANTHRAHYDROQUINONES

Daniel S. Raden, Chicago, Ill., assignor to Velsicol Chemical Corporation, Chicago, Ill., a corporation of Illinois

No Drawing. Filed Apr. 16, 1962, Ser. No. 187,955
11 Claims. (Cl. 260—617)

1. A compound of the formula:

wherein each X is independently selected from the group consisting of chlorine and bromine; and R_1, R_2, R_3, and R_4 are independently selected from the group consisting of hydrogen, chlorine, bromine, and alkyl radicals of from 1 to 3 carbon atoms.

3,272,873

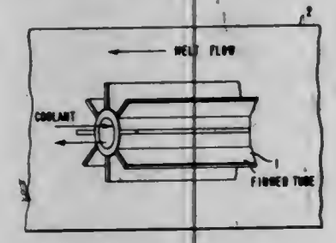
HYDROGENATION OF ALPHA,BETA-UNSATURATED ALDEHYDES

Walter James Porter, Jr., Baton Rouge, La., Rhea N. Watts, deceased, late of St. Francisville, La., by Beulah Smith Watts, legal representative, St. Francisville, La., and Leroy Virgil Robbins, Jr., Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed Oct. 18, 1961, Ser. No. 146,037
8 Claims. (Cl. 260—638)

1. A process for producing a dimer alcohol from a feed containing at least 5 wt. percent of a C_6 to C_{40} alpha,beta unsaturated dimer aldehyde and from 0.05 to 5 wt. percent of a cobalt soap of a C_6 to C_{22} carboxylic acid which comprises contacting said feed with hydrogen at a hydrogen pressure above 500 p.s.i.g., but not exceeding 3500 p.s.i.g., and at a temperature between 300° and 475° F. whereby said cobalt soap is reduced to cobalt metal and the olefinic bond in said alpha-beta-unsaturated dimer aldehyde is saturated with hydrogen, removing said cobalt metal and thereafter hydrogenating the resultant saturated dimer aldehyde product to the corresponding dimer alcohol in the presence of a hydrogenation catalyst.

3,272,874

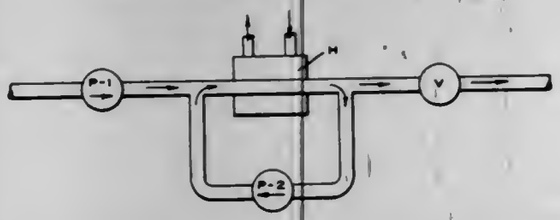


PRODUCTION OF NITROALKANES

Richard L. Abbott, Terre Haute, Ind., assignor to Commercial Solvents Corporation, New York, N.Y., a corporation of Maryland

No Drawing. Filed Nov. 18, 1964, Ser. No. 412,244
3 Claims. (Cl. 260—644)

1. In a process for the production of substantial amounts of nitromethane, nitroethane, 1-nitropropane and 2-nitropropane by the vapor phase nitration of propane at predetermined elevated temperatures and pressures, with a nitrating agent selected from the group consisting of nitric acid, nitrogen dioxide and mixtures thereof, the improvement which comprises effecting said nitration in the presence of sulfur dioxide, thereby producing enhanced amounts of nitromethane and 2-nitropropane while still producing lesser but substantial amounts of nitroethane and 1-nitropropane as compared with a process conducted in the absence of an oxygenated sulfur compound.



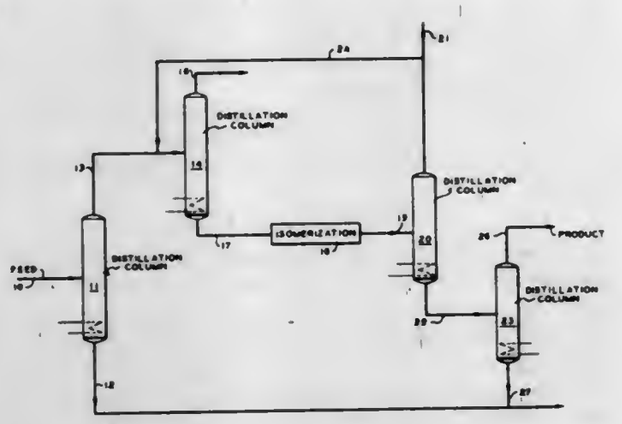
3,272,875
SURFACE CRYSTALLIZATION PROCESS
Mendel T. Gordon and Gilbert P. Monet, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Apr. 26, 1965, Ser. No. 450,818
7 Claims. (Cl. 260—646)

1. A crystallization process for depositing a dense, glass-like crystal layer on a cooling surface which comprises contacting a liquid mixture having at least one crystallizable component with said cooling surface and circulating said mixture over said cooling surface at a constant rate while simultaneously controlling the liquid melt temperature and coolant temperature so as to maintain a controlled constant concentration gradient at the mother liquor-crystal interface.

7. A surface crystallization process for separating 3,4-dichloronitrobenzene from its admixture with 2,3-dichloronitrobenzene which comprises circulating said mixture over a cooling surface at a constant rate of one foot per second while simultaneously controlling the liquid melt temperature and coolant temperature so as to maintain a controlled constant concentration gradient at the mother liquor-crystal interface.

3,272,876
CYCLOOLEFIN PRODUCTION
Ralph Levine, Lake Charles, La., assignor, by mesne assignments, to Columbian Carbon Company, a corporation of Delaware
Filed June 14, 1962, Ser. No. 202,416
31 Claims. (Cl. 260—666)

1. In a method of continuously reacting substituted or unsubstituted conjugated open-chain diolefins to give a polyolefinic cyclooligomer of said diolefin, said cyclooligomer having at least eight cyclic carbon atoms, which method comprises the steps of continuously introducing said diolefin into a reaction zone, introducing a catalyst into said reaction zone, said catalyst comprising zero-valent nickel and having the empirical formula

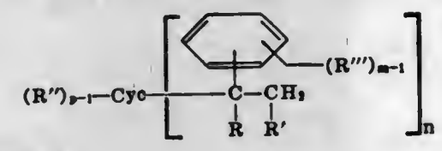


$$[(RO_a)_3Z]_xNi(CO)_{4-x}$$

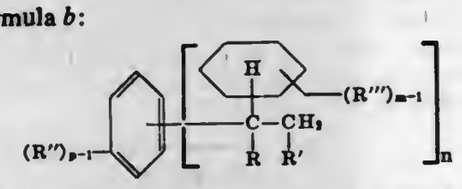
wherein R is an organic radical, Z is selected from the group of trivalent elements phosphorus, arsenic, and antimony, "a" is from one to zero, and "x" is between one and four inclusive, the quantity of said catalyst being between about 0.001 and 10%, based on the weight of said diolefin, heating the contents of said reaction zone to a temperature between about 40° C. and 250° C., applying a pressure throughout the reaction zone at least equivalent to the vapor pressure of the reaction mixture, said catalyst being in solution in said mixture, and continuously withdrawing a part of the reactiion mixture including products of a reaction as final products; the improvement comprising continuously backmixing the balance of the reaction mixture with said diolefin introduced; controlling the volume of reaction mixture, the rate of introduction of diolefin, and the rate of withdrawal of reaction mixture as final product to give a mass flow rate of between about 0.01 and about 10 grams of said diolefin introduced per millilitre of volume of liquid-occupied space in said reaction zone per hour; maintaining a substantially constant concentration of said diolefin in said reaction mixture at a point in the range of 3–60% by weight of the reaction mixture, and maintaining a relatively uniform composition of said reaction mixture throughout said occupied space by the backmixing per unit of time at least an amount of the reaction mixture equal in weight to the weight of diolefin introduced.

3,272,877
OLEFIN CONVERSION TO ALICYCLIC HYDROCARBONS
Raymond A. Franz, Kirkwood, and Richard N. Moore, Creve Coeur, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed May 16, 1963, Ser. No. 281,008
14 Claims. (Cl. 260—666)

1. A process for producing alicyclic hydrocarbons from olefin hydrocarbons which comprises subjecting olefin hydrocarbons of 2 to 20 carbon atoms in the absence of a catalyst to a temperature of 300 to 500° C. and a pressure of 200 to 20,000 p.s.i.g. in a non-catalytic reaction zone in the presence of a mixture of at least two different modifying agents, one of said modifying agents being selected from the group consisting of hydrogen chloride, hydrogen bromide, hydrogen iodide and mixtures thereof and compounds and elements which under the conditions of the reaction zone will form a member of the group consisting of hydrogen chloride, hydrogen bromide, hydrogen iodide and mixtures thereof, and the other of said modifying agents being one selected from the group consisting of hydrogen sulfide, elemental sulfur and compounds which under the conditions of the reaction zone will form hydrogen sulfide.

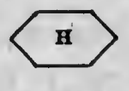


3,272,878
PRODUCTION OF C_6 CYCLIC HYDROCARBONS
John T. Cabbage, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Apr. 7, 1964, Ser. No. 357,888
4 Claims. (Cl. 260—666)



1. A process which comprises passing a hydrocarbon mixture to a first distillation zone, said hydrocarbon mixture comprising isohexane and lighter materials, normal hexane, methylcyclopentane, 2,2-dimethylpentane, 2,4-dimethylpentane, benzene, cyclohexane and materials heavier than cyclohexane; withdrawing from said first distillation zone a residual hydrocarbon fraction containing hydrocarbons heavier than cyclohexane; passing the remainder of said hydrocarbon mixture containing cyclohexane and materials lighter than cyclohexane from the upper region of said first distillation zone to a second distillation zone; withdrawing from said second distillation zone an overhead stream containing isohexane and lighter hydrocarbons; withdrawing from said second distillation zone a first bottoms stream containing 2,2-dimethylpentane, 2,4-dimethylpentane, benzene, cyclohexane, substantially all of the methylcyclopentane contained in said hydrocarbon mixture and a major portion of normal hexane contained in said hydrocarbon mixture; passing the thus withdrawn first bottoms stream into an isomerization zone containing a catalyst consisting of fluoride promoted platinum-alumina; maintaining the temperature and pressure in said isomerization zone in the ranges of 400 to 750° F. and 300 to 500 p.s.i.g., respectively, to isomerize: normal hexane in the hydrocarbon feed to said isomerization zone to isohexane; 2,2-dimethylpentane and 2,4-dimethylpentane in the hydrocarbon feed to said isomerization zone to higher boiling isoheptanes; and cyclohexane in the hydrocarbon feed to said isomerization zone to methylcyclopentane; passing the effluent from said isomerization zone to a third distillation zone; withdrawing from said third distillation zone an overhead stream containing hydrocarbons lighter than normal hexane and a minor amount of the normal hexane contained in said isomerization zone effluent; withdrawing from said third distillation zone a second bottoms stream containing methylcyclopentane, benzene, cyclohexane and heavier hydrocarbons and a major portion of the normal hexane contained in said isomerization zone effluent; passing the thus withdrawn second bottoms stream into a fourth distillation zone; withdrawing from said fourth distillation zone an overhead product containing substantially all of the normal hexane contained in said second bottoms stream and at least 60 volume percent cyclic C_6 hydrocarbons, and withdrawing isoheptane and heavier hydrocarbons from the lower region of said fourth distillation zone.

3,272,879
HIGH ENERGY FUELS AND METHODS
Eldon E. Stahly, Birmingham, Mich., assignor, by mesne assignments, to Sinclair Research, Inc., a corporation of Delaware
No Drawing. Filed Dec. 28, 1959, Ser. No. 862,017
3 Claims. (Cl. 260—668)



1. A composition of matter comprising a mixture of position isomers of at least one of Formula *a*:

and Formula *b*:

wherein in Formulas *a* and *b*

is a cyclohexane ring, R and R' are members of the group consisting of hydrogen, alkyl, and Cyc-alkyl which together with the ethyl group contain 2 to 12 carbon atoms, R'' is a member of the group consisting of hydrogen, alkyl, and Cyc-alkyl, R''' is a member of the group consisting of alkyl, Cyc-cycloalkyl, hexahydroindanyl and hexahydroalkindanyl, the hydrocarbon radicals R'' and R''' each having from 1 to 12 carbon atoms, Cyc is a member of the group consisting of cyclo-C_5 and cyclo-C_6 alkanes, *m* is an integer of 1 to 5, *n* is an integer of 1 to 3 and *p* is an integer from 1 to 4.

3,272,880
CHEMICAL PROCESS AND PRODUCTS PRODUCED THEREBY
Norman L. Wendler, Summit, and David Taub, Metuchen, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey
No Drawing. Filed July 24, 1962, Ser. No. 212,144
2 Claims. (Cl. 260—668)

1. A method of making a 5-allyl-5H-dibenzo-[a,d]-cycloheptene which comprises reacting a 5-metallo-5H-dibenzo-[a,d]-cycloheptene with an allyl halide.

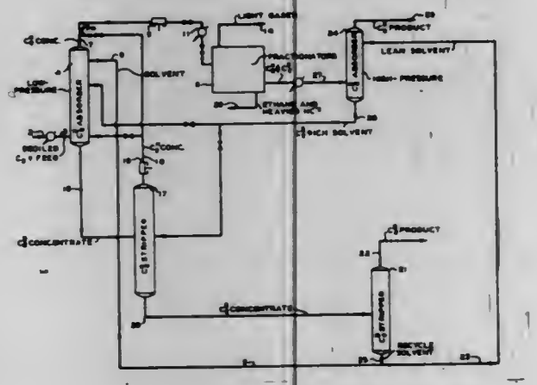
3,272,881
PREPARATION OF DETERGENT ALKYLATES
Brij L. Kapur and Oliver C. Kerfoot, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma
No Drawing. Filed Nov. 4, 1963, Ser. No. 321,338
6 Claims. (Cl. 260—668)

1. A method for converting polyphenylalkanes present in a bottoms fraction obtained as a by-product in alkylating benzene with a chlorination product of from 0.1–0.8 atom of chlorine per mole of an alkane selected from the group consisting of C_{10}–C_{16} normal paraffins and mixtures thereof, into detergent grade polycyclic compounds boiling in the range from about 570–725° F., which comprises reacting said bottoms fraction with aluminum chloride at a temperature between about 40 and 150° C.

3,272,882
PREPARATION OF β-PHENYLNAPHTHALENE
John J. van Veenooy, Wyncroft, Media, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Filed Dec. 20, 1963, Ser. No. 332,298
2 Claims. (Cl. 260—668)

1. Method of making β-phenylnaphthalene which consists essentially of treating β-chlorostyrene with a non-acidic aqueous medium at a temperature in the range of 225 to 400° C.

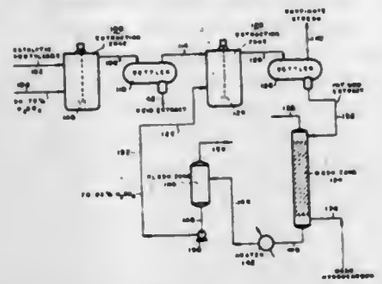
3,272,883
SYNTHESIS OF 3-PHENYLINDENE
Lawrence J. Hughes, Hitchcock, Tex., assignor to Monsanto Company, a corporation of Delaware
No Drawing. Filed Dec. 27, 1963, Ser. No. 334,030
10 Claims. (Cl. 260—668)



1. A method for the production of 3-phenylindene which comprises reacting benzene with a halohydrocarbon chosen from the group consisting of 1,3-dihalopropenes, 1,2,3-trihalopropanes, and 1,3,3-trihalopropanes in the presence of a Friedel-Crafts catalyst and recovering 3-phenylindene from the resulting reaction mixture.

3,272,884
METHOD FOR THE RECOVERY OF ANTHRACENE
Norman S. Boodman, Monroeville, Philip X. Masciantonio, Penn Township, Westmoreland County, and George W. Perkins, Delmont, Pa., assignors to United States Steel Corporation, a corporation of Delaware
No Drawing. Filed June 7, 1965, Ser. No. 462,078
12 Claims. (Cl. 260—675)

1. A process for the recovery of purified anthracene from a middle creosote fraction of coal tar containing



anthracene and boiling in a range between about 315° and 355° C., said process comprising heating and dissolving said fraction in a light creosote fraction of coal tar boiling below about 315° C., at least about 20% by weight of said light creosote fraction boiling below about 280° C., cooling said mixture to at least about 65° C., separating anthracene cake and creosote fraction, heating and dissolving said anthracene cake in a recycled heavy tar-base fraction of coal tar, cooling said mixture to at least about 55° C., separating anthracene crystals and tar-base fraction, heating and dissolving said anthracene crystals in a fresh portion of heavy tar-base fraction of coal tar boiling in a range between about 230° and 270° C., cooling said mixture to at least about 55° C., separating purified anthracene crystals and tar-base fraction and recycling the latter to said first crystallization step with a heavy tar-base fraction.

3,272,885
SEPARATION OF ETHYLENE FROM ACETYLENE
Joseph W. Davison, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Oct. 1, 1962, Ser. No. 227,147
9 Claims. (Cl. 260—677)

1. A process for the separation of ethylene and acetylene from a gaseous mixture containing the same in approximately equal proportions which comprises: introducing said mixture to the lower portion of a first absorber zone operating at a first pressure and passing the same upwardly countercurrent to a downwardly moving stream of a lean solvent selective for said acetylene; passing ethylene concentrate containing some acetylene from the upper portion of said first absorber zone to a fractionation zone; drawing solvent enriched with acetylene from the lower portion of said first absorber and passing the same to a first stripping zone; passing additional stripped ethylene from the upper portion of said first stripping zone to the lower portion of said first absorber zone; drawing solvent further enriched with acetylene from the lower portion of said first stripping zone and passing the same to a second stripping zone; recovering acetylene product from the upper portion of said second stripping zone; drawing stripped solvent from the bottom portion of said second stripping zone suitable for further use; removing light gases from said fractionation zone; drawing ethane and higher hydrocarbons from said fractionation zone; passing a stream rich in acetylene and ethylene from said fractionation zone to a second absorption zone operating at a second pressure, said second pressure being considerably higher than said first pressure; recycling solvent rich in acetylene from the bottom portion of said second absorber to said first stripping zone; and recovering ethylene product substantially free of acetylene from the upper portion of said second absorber zone.

3,272,886
PRODUCTION OF NORMAL PENTENES
William R. Edwards and Robert D. Wesselhoft, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N.J., a corporation of Delaware
Filed Nov. 4, 1963, Ser. No. 321,256
3 Claims. (Cl. 260—677)

1. A method of producing high-purity normal pentene which comprises
contacting a catalytic pentylene stream containing tertiary pentenes, normal pentenes, and C_5 paraffins with H_2SO_4 having a weight concentration of 50% to 75%
at a temperature of 20° F. to 70° F.
a ratio of acid-to-hydrocarbon stream of 10:1 to 1:10 and a residence time of 0.1 to 4 hours,
whereby a tertiary pentylene-free raffinate is obtained,
contacting said raffinate with H_2SO_4 having a concentration of 78 to 82 weight percent
at a temperature of 20° F. to 50° F.,
a ratio of acid to first raffinate of 10:1 to 1:10,
and a residence time of 1 to 6 hours,
whereby a normal pentene-containing fat acid extract is obtained,
washing said flat acid by contact with a wash hydrocarbon stream at a temperature of 20° F. to 50° F.,
said wash hydrocarbon boiling within a range substantially different from said normal pentene,
and indirectly heating said washed fat acid extract without dilution to a final temperature of 275° F. to 325° F.,
and at a rate of at least 1000° F. per minute,
whereby a substantially pure normal pentene stream is obtained with only minimal losses to polymer.

3,272,887
ISOMERIZATION OF OLEFINS USING SEPIOLITE CATALYST
Robert Chalmers Pitkethly, John Frederick Ford, and Arnold Fisher, all of Sunbury-on-Thames, Middlesex, England, assignors to The British Petroleum Company Limited, London, England, a British joint-stock corporation
No Drawing. Filed Oct. 15, 1963, Ser. No. 316,469
Claims priority, application Great Britain, Nov. 6, 1962, 41,931/62
8 Claims. (Cl. 260—683.2)

1. A process for the isomerization of a mono-olefin having between 4 and 6 carbon atoms per molecule, which is capable of undergoing double bond shift, which process comprises isomerising the olefin in contact with a sepiolite catalyst at between 50° and 500° C.

3,272,888
REDUCING PROPANE PRODUCTION IN AN ALKYLATION PROCESS
Richard S. Logan and Thomas Hutson, Jr., Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Nov. 16, 1964, Ser. No. 411,572
4 Claims. (Cl. 260—683.43)

1. A process which comprises passing propylene to an alkylation zone containing an alkylation catalyst, passing

isobutane to said alkylation zone, maintaining liquid phase alkylation conditions within said alkylation zone, maintaining a concentration of propane in the range of about 14 to about 16 weight percent in the total hydrocarbon feed to said alkylation zone, and maintaining said propane in the liquid phase throughout the alkylation reaction.

3,272,889
EPOXIDE COPOLYMERS
Edwin J. Vandenberg, Wilmington, Del., assignor to Hercules Incorporated, a corporation of Delaware
No Drawing. Filed May 27, 1964, Ser. No. 370,717
12 Claims. (Cl. 260—823)

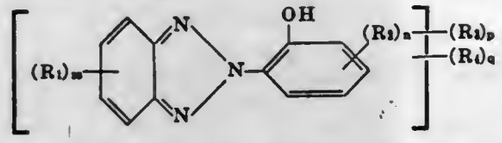
1. A crystalline copolymer consisting of cis-butene-2-oxide and a second epoxide monomer of the formula

where Z and Z' are each selected from the group consisting hydrogen and a radical of the formula

$$—CH_2—(O—CH_2—CH_2)_n—OCH_3$$

where n is 0 or 1, and when Z and Z' are

$$—CH_2—(O—CH_2CH_2)_n—OCH_3$$

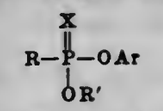


the monomer has a cis configuration, said copolymer containing about 1% to about 30% of said second epoxide based on the weight of the copolymer.

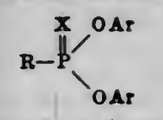
3,272,890
COMPATIBLE POLYOLEFIN AND POLYURETHANE COMPOSITION
John M. O'Leary, Jr., Wilmington, Del., assignor, by mesne assignments, to Container Corporation of America, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Mar. 4, 1963, Ser. No. 262,362
4 Claims. (Cl. 260—859)

1. A molded article formed from a compatible polymer composition consisting essentially of a homogeneous mixture of 85 to 75 weight percent of a polyolefin selected from the group consisting of polyethylene, polypropylene, polyethylene copolymer having a major weight percentage of polyethylene, and mixtures thereof, and from 15 to 25 weight percent of polyurethane, which composition possesses excellent resistance characteristics in the cold state to hydrocarbon solvents, and may be readily compression molded.

3,272,891
STABILIZING POLYMERS WITH ALKENOYL-AMIDO- AND PHENYLBENZATRIAZOLES
Jerry Peter Millonis, Franklin Township, Somerset County, William Baptist Hardy, Bound Brook, and William Frederick Baltinger, Jr., Belle Mead, N.J., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine
No Drawing. Filed Oct. 14, 1964, Ser. No. 403,928
6 Claims. (Cl. 260—895)



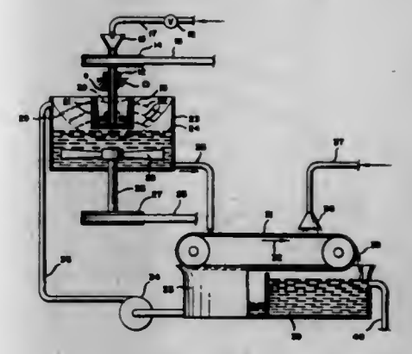
1. A composition comprising 0.01 to 2.0% of a member selected from the group consisting of (a) the compound of the formula:



wherein R_1 and R_2 are selected from the group consisting of lower alkyl, lower alkoxy, halogen, nitro, carboxy, sulfonic acid and sulfonamido, R_3 is either acrylylamino or methacrylylamino, R_4 is either acrylyloxy or methacrylyloxy, m and n are integers less than three, and p and q are integers less than four, at least one of p and q being greater than zero, and R_3 and R_4 being bonded directly to carbocyclic aromatic rings in the phenyl benzotriazole nucleus; and (b) a homopolymer of the compound of (a) having an intrinsic viscosity at 30° C. of 0.03 to 0.50 and a DMAC solubility of at least 5%; and a polymer selected from the group consisting of polyesters, polystyrenes, polyolefins, polyacrylates, polycarbonates, polyvinylchlorides and polyvinylfluorides.

3,272,892
METHOD OF PREPARING ORGANIC PHOSPHONATES BY TRANSESTERIFICATION
Karoly Szabo, Pleasantville, N.Y., assignor to Stauffer Chemical Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed Mar. 4, 1963, Ser. No. 262,340
5 Claims. (Cl. 260—982)

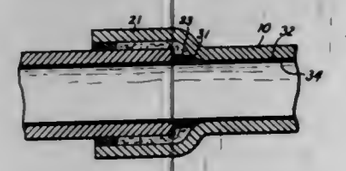
1. The method of preparing a mixed alkyl aryl alkylphosphonate of the following formula:



wherein each of R and R' represents an alkyl radical of from 1 to 18 carbon atoms, Ar represents an aromatic hydrocarbon residue selected from the class consisting of a phenyl radical and a naphthyl radical and X is a chalcogen selected from the class consisting of oxygen and sulfur, which comprises reacting under anhydrous conditions in the presence of an alkali metal salt of a weak acid capable of forming a phenoxide ion with phenol as the catalyst and in approximately equal molar amounts an aliphatic alcohol of the formula R'—OH wherein R' has the significance as above set forth with an alkyl phosphonate of the formula:

wherein R, X, Ar have the values as above defined and separating the resulting mixed alkyl aryl alkylphosphonate from the phenolic by-product.

3,272,893
METHOD FOR THE PRODUCTION OF FLUID PEARLS
Sten Mogensen, Djursholm, Sweden, assignor to AGA Aktiebolag, a corporation of Sweden
Filed Feb. 25, 1963, Ser. No. 260,615
Claims priority, application Sweden, Mar. 19, 1962, 3,033/62
4 Claims. (Cl. 264—8)



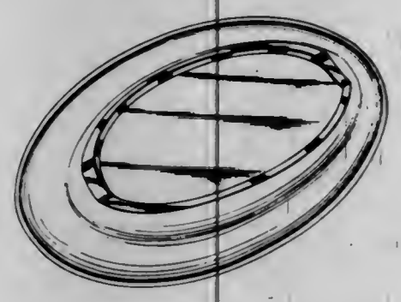
1. In a method for the production of fluid pearls, the steps comprising: feeding a pearl forming material to a rotatable body provided with orifices sized in accordance with the desired dimensions of the pearls, the orifices being inclined in a direction away from the direction of rotation of the body, rotating the body so that the pearl

forming fluid is ejected from the orifices in the form of drops into an atmosphere through which they pass until they reach the surface of a curing bath located in a second vessel where the fluid pearls are cured, said drops of pearl forming material being ejected from the orifices in a direction of movement which has a component in a direction opposite to the surface rotational direction of the rotating body, and removing the cured fluid pearls from the curing bath.

3,272,894
METHOD OF SEALING VESSELS AND JOINTS THEREOF

Robert Lee Roach, West Chester, Pa., assignor to West Chester Chemical Company, West Chester, Pa., a partnership consisting of W. L. Williams, H. A. Bogle, and E. O. Hilbush

Original application Sept. 24, 1957, Ser. No. 685,784. Divided and this application June 6, 1961, Ser. No. 115,099
9 Claims. (Cl. 264—36)

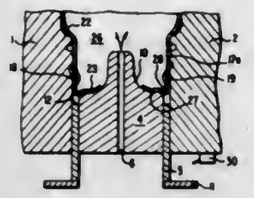


1. The method of sealing and coating a leak in a vessel wherein the leak region comprises a joint having packing and adjacent surfaces, said leak region having an electrical charge; which comprises the steps of wetting the articles to be sealed with a sealant composition containing a stable aqueous dispersion of elastomeric rubbery solids and a surface-active agent, said composition having an ionic-active charge opposite to the electrical charge of said leak region so as to penetrate said leaks; removing excess of the sealant composition to leave a film deposited on said article, and drying the sealant composition retained by said article to provide an elastic rubbery mass for sealing said leaks.

3,272,895
METHOD OF MAKING CERAMIC DISHWARE

William J. Rech, Neshannock Township, Lawrence County, Pa., assignor to Shenango Ceramics, Inc., New Castle, Pa., a corporation of Pennsylvania

Original application Oct. 15, 1959, Ser. No. 846,571, now Patent No. 3,190,486, dated June 22, 1965. Divided and this application May 6, 1965, Ser. No. 453,650
4 Claims. (Cl. 264—62)



1. In the method of making vitrified ceramic elongated ware adapted to be stable in use on a horizontal planar surface, by means of spaced arcuate feet symmetrically disposed with respect to the longitudinal center line of the ware, comprising the steps of forming said ware in a green state, firing, and glazing the same, the steps of forming said ware with a continuous elliptical foot and eliminating end portions of said foot prior to firing.

3,272,896
METHOD AND APPARATUS FOR FORMING PLASTIC ARTICLES

Raymond E. Winchester, Jr., Pawcatuck, Conn., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

Filed Nov. 13, 1963, Ser. No. 323,398
16 Claims. (Cl. 264—98)

1. A method of forming an article from plastic material, said method comprising:

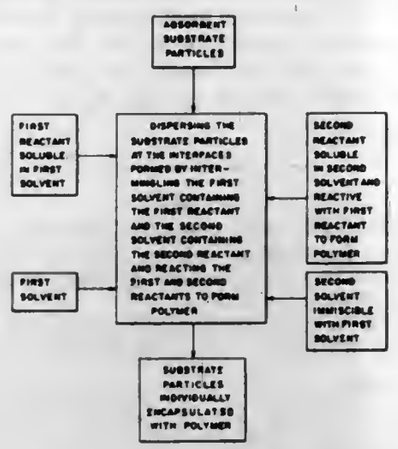
positioning a generally tubular length of plastic material within a closed, sectional mold, with one end of said length being open and engaging an end of mandrel means, said end of said length being unrestrained against radially outward movement and spaced from interior wall portions of said closed mold sections; and

thereafter introducing pressurized fluid into the interior of said length of plastic material so as to cause radial expansion thereof while said end of said length remains in engagement with said end of said mandrel means and the extremity of said end of said length remains spaced from said interior wall portions of said closed mold sections and moving said mandrel means toward said end of said length of plastic material so as to cause said end of said length to fold over inwardly toward the interior of said length and lie adjacent an inner, tubular wall portion of said length.

7. An apparatus for forming an article from plastic material, said apparatus comprising:

means for positioning a generally tubular length of a plastic material within a closed, sectional mold, with one end of said length being open and engaging an end portion of mandrel means, said mandrel means having a gradually outwardly expanding shoulder, said end of said length being unrestrained against radially outward movement;

said closed mold sections including interior wall portions radially spaced from said end of said length; and



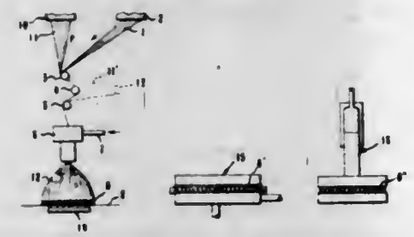
means for moving said mandrel means toward said end of said length of plastic material so as to cause said end of said length to fold over inwardly along said shoulder toward the interior of said length and lie adjacent an inner, tubular wall portion of said length.

3,272,897
METHOD OF MAKING POLYMER COATED SUBSTANCES AND MOLDING THEM INTO AN ARTICLE

Daniel F. Herman, Princeton, N.J., and Albert L. Resnick, Jericho, N.Y., assignors to National Lead Company, New York, N.Y., a corporation of New Jersey

Filed Nov. 1, 1962, Ser. No. 234,845
20 Claims. (Cl. 264—109)

1. A process for the encapsulation of finely divided particles with a polymer comprising dispersing the finely divided particles at the interfaces of two intermingled, immiscible solutions, one of said solutions containing a first reactant capable of reacting with a second reactant dissolved in the other solution to form a polymer, where-



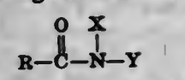
by each of the particles is individually encapsulated by said polymer formed by said reactants.

3,272,898
PROCESS FOR PRODUCING A NONWOVEN WEB

Terence Edward Creasey Knee, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

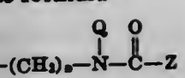
Filed June 11, 1965, Ser. No. 468,668
6 Claims. (Cl. 264—119)

1. A process for producing a bulked nonwoven structure of continuous filaments of synthetic organic polymeric composition comprising (1) forming an unbonded nonwoven web composed of continuous filaments of synthetic, organic polymeric composition with a major portion of said continuous filaments having a shrinkage value of less than about 15%, and a minor portion of said continuous filaments having a shrinkage value of at least about 40%, said forming characterized by the process conditions necessary to form the said continuous filaments having the said shrinkage values, said major and minor portions of said continuous filaments being randomly and thoroughly admixed with one another, and then (2) subjecting said unbonded nonwoven web to shrinkage conditions while in an unrestrained state in order to cause said minor portion of said continuous filaments to draw together the major portion of said continuous filaments into twisted, convoluted, crimped configurations, and cause bulking of said nonwoven web as well as a reduction in area of said nonwoven web of at least about 20%.



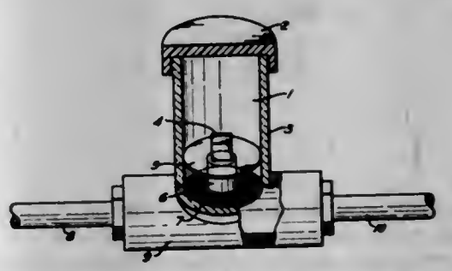
3,272,899
PROCESS FOR PRODUCING A SOLID RINSE BLOCK

Jack Diamond, Culver City, and Wayne M. Gauntt, Los Angeles, Calif., assignors to Hagan Chemicals & Controls, Inc., Pittsburgh, Pa.



Original application Dec. 6, 1960, Ser. No. 74,178, now Patent No. 3,154,498, dated Oct. 27, 1964. Divided and this application Apr. 3, 1964, Ser. No. 362,546
5 Claims. (Cl. 264—126)

1. Method of making a solid rinse and block which will dissolve gradually and uniformly comprising:

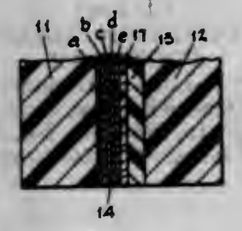


(a) melting together at least one solid nonionic wetting agent and, in an amount about 3% to about 20% of the total weight of the melt, an alkyl substituted amide having the formula

where "R" is an alkyl group of at least about 6 carbon atoms, "X" is selected from the group consisting of hydrogen and alkyl groups, and "Y" is selected from the group consisting of hydrogen, alkyl group, and radicals of the formula

where "*n*" is an integer from 1 to about 4, "Z" is an alkyl group having at least about 6 carbon atoms, and "Q" is selected from the group consisting of hydrogen and alkyl groups;

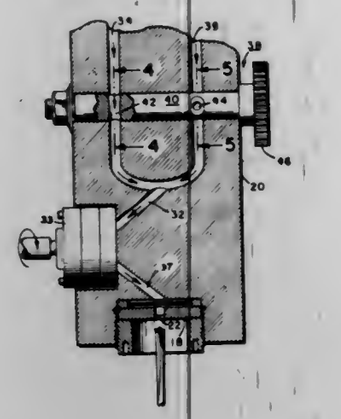
(b) pouring the melt thus formed in a shallow pan; and



(c) cooling the melt in said shallow pan in the temperature range from about 0° F. to room temperature, whereby a solidified mass is formed.

2. The method of claim 1 including the steps of dividing the solidified mass into particles, and pressing said particles into a desired shape.

3,272,900
METHOD OF FABRICATION OF LAMINATED STRUCTURES

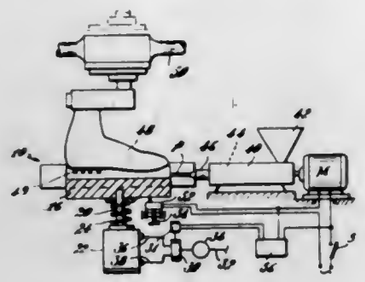


Joseph D. Ryan and Paul T. Mattimoe, Toledo, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Filed May 13, 1963, Ser. No. 279,754
8 Claims. (Cl. 264—135)

1. A method of producing a laminated electrically conductive structure, comprising applying a transparent electrically conductive film to a first plastic sheet, applying a protective coating over said film, arranging said first sheet in spaced relation to a second plastic sheet, with the protective coating toward said second sheet, casting a flowable plastic material into the space between said sheets and in contact with the inner surface of said second sheet and the protective coating on said first sheet, said protective coating being effective to chemically protect and inhibit crazing of said electrically conductive film and prevent contact between said film and said flowable plastic material, and curing the structure whereby said plastic material sets to form a flexible plastic interlayer bonding the sheets into a unitary structure.

3,272,901
TEXTILE FILAMENT HAVING APPARENT VARIABLE DENIER
James G. Sims, Pensacola, Fla., assignor to Monsanto Company, a corporation of Delaware
Original application Nov. 21, 1962, Ser. No. 239,189, now Patent No. 3,138,516, dated June 23, 1964. Divided and this application Oct. 2, 1963, Ser. No. 313,375
4 Claims. (Cl. 264—177)



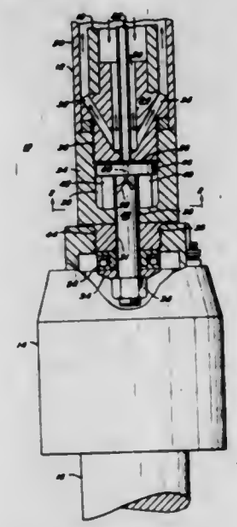
1. In a method of making a textured continuous filament, the steps comprising in combination:
(a) extruding through a non-circular orifice a continuous stream of a molten macroscopically non-homogeneous mixture of first and second compatible polymer components, said first component having a relatively high ratio of viscosity to surface tension as compared to said second component, said mixture being sufficiently non-homogeneous that substantially the entire stream leaving said orifice at particular times consists of said first component and substantially the entire stream leaving said orifice at other particular times consists of said second component and
(b) solidifying the polymer stream so extruded at a rate such that the portions composed of said second component assume a substantially circular cross-section while the portions composed substantially of said first component assume a substantially non-circular cross-section.

3,272,902
METHOD OF INJECTION MOLDING PLASTIC FOOTWEAR
Herbert P. Ludwig, Desmastr. 112, Uesen, near Bremen, Germany
Filed Apr. 16, 1964, Ser. No. 360,290
5 Claims. (Cl. 264—244)

2. The method of making plastic footwear comprising the steps of:
injection molding an integrated upper, midsole and heel core by injecting a charge of liquid plastic into a first mold about a rigid form of the desired shape;
cooling the molded article to effect solidification and shrinkage;
placing the mold article over a second injection mold; and
injection molding an integrated outsole and heel cover to cover the insole and heel core by injecting a second charge of liquid plastic into the second mold to cover the insole and heel core while holding the injected plastic confined by said second mold to the desired dimensions.

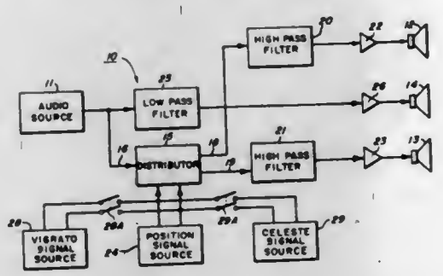
3,272,903
METHOD FOR MAKING SHOES
Henry Hardy, Cambridge, Mass., assignor to International Vulcanizing Corporation, Boston, Mass., a corporation of Massachusetts
Filed Nov. 12, 1963, Ser. No. 322,749
6 Claims. (Cl. 264—244)

1. The method of attaching a shoe bottom of predetermined thickness to an upper comprising as steps: providing a mold having an open top and comprising a side wall defining a space of the precise transverse shape and dimensions of the shoe bottom to be formed and a movable bottom wall, supporting a lasted upper with its bottom in registry with the open top of the mold and with the bottom of the mold at a predetermined distance therefrom, yieldably opposing relative movement between the bottom of the upper and the mold bottom, injecting a liquid bottom-forming composition into the mold between the bottom of the upper and the mold, employing the displacement of the bottom wall as the elastomer is injected to terminate injection when the volume of elastomer injected is such that upon transformation from liquid to solid it will form a bottom of said predetermined thickness, applying added pressure to the sole plate following termination of injection and maintaining said added pressure until transformation of the liquid to solid is completed.



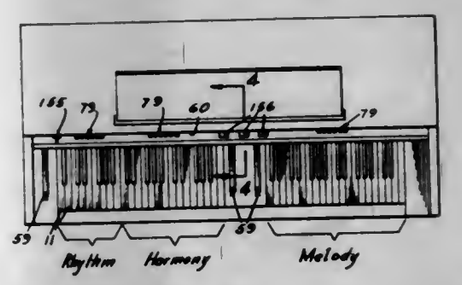
3,272,904
METHOD OF MAKING SEALING MEMBERS
Phillip V. Millard, Detroit, Mich., assignor to Automotive Rubber Company, Inc., Detroit, Mich., a corporation of Michigan
Original applications Jan. 3, 1961, Ser. No. 80,444, now Patent No. 3,182,119, dated May 4, 1965, and Jan. 2, 1962, Ser. No. 163,411. Divided and this application Nov. 5, 1964, Ser. No. 409,141
2 Claims. (Cl. 264—275)

1. The method of making a sealing member having a sheet metal body with a portion embedded in a resilient plastic body that has accurately formed sealing surfaces which are accurately positioned relative to the metal body, which comprises forming a registering surface on the underside of said metal body on which the plastic body is to be formed, supporting the metal body at said registering surface from an area of a mold which is spaced inwardly from the peripheral edge of the metal body such that the portion of the metal body on which the plastic body is to be formed extends into a cavity of the mold and is suspended in the cavity in accurately spaced relation to the bottom of the cavity and in accurately spaced relation laterally of the cavity, introducing a predetermined quantity of uncured vinyl plastic material into said cavity, and curing said vinyl plastic material to form a resilient plastic body on said portion of the metal body which is suspended within said cavity.



ELECTRICAL

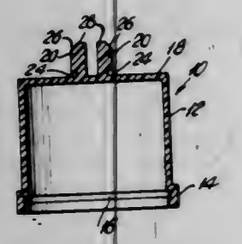
3,272,905
CONTINUOUS WEIGHING OF A CONSUMABLE ELECTRODE
Patrick J. Wooding, Moorestown, N.J., assignor to Consarc Corporation, Rancocas, N.J., a corporation of New Jersey
Filed June 24, 1963, Ser. No. 290,076
20 Claims. (Cl. 13—9)



1. Apparatus comprising a vacuum furnace, an electrically conducting ram, an electrode stub clamp, connecting means within the furnace for connecting said ram to said clamp, said connecting means including a load sensing means for sensing the weight of an electrode held by said clamp by determining the stress on said connecting means, said connecting means being operative to conduct current from said ram to said clamp.

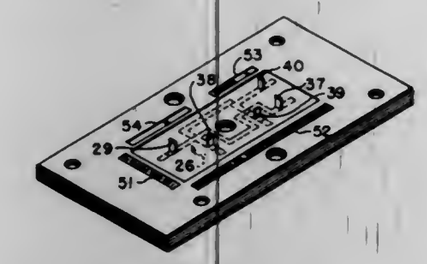
3,272,906
AUDIO REPRODUCTION SYSTEM
Adrian J. De Vries, Elmhurst, George V. Morris, Chicago, and Erwin M. Roschke, Des Plaines, Ill., assignors to Zenith Radio Corporation, a corporation of Delaware
Filed Oct. 25, 1960, Ser. No. 64,762
12 Claims. (Cl. 84—1.25)

1. An audio reproduction system comprising: a source of audio signals; a plurality of individual audio reproduction devices; means for utilizing said audio signals to energize said reproduction devices including at least one electric discharge device responsive to an applied control signal to control the relative intensity of sound reproduction by said audio reproduction devices; means for developing a first control signal having a frequency in the low-frequency portion of the audio spectrum and for developing a second control signal also having a frequency in the low-frequency portion of the audio spectrum but higher in frequency than said first control signal; and means for applying said first control signal to said discharge device of said utilizing means for effecting a predetermined amplitude variation in said audio signals at the frequency of said first control signal to vary the effective dominant source of sound reproduced by said audio reproduction devices and for concurrently applying said second control signal to said utilizing means for effecting a predetermined amplitude variation in said audio signals at the frequency of said second control signal to produce a "vibrato" or "celeste" subjective listening effect.



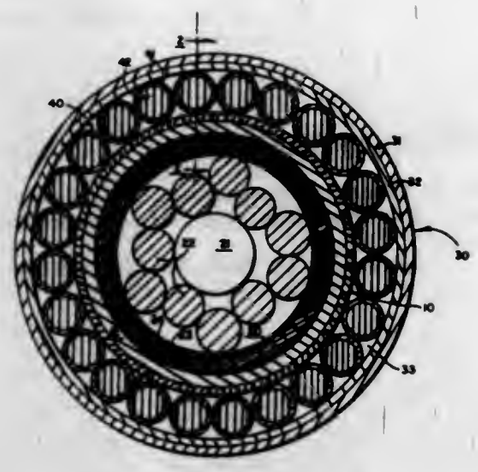
3,272,907
ELECTRICAL MUSICAL INSTRUMENT HAVING PRE-RECORDED TAPE FOR TONE GENERATION
Harry C. Chamberlin, 354 Winn Drive., Upland, Calif.
Filed Feb. 3, 1964, Ser. No. 341,952
6 Claims. (Cl. 84—1.28)

1. An instrument for playing musical compositions, comprising:
(a) a rhythm reproducing part;
(b) and a melody reproducing part;
(c) said rhythm reproducing part including a first set of twelve tapes, each tape of said first set having recorded thereon an incomplete chord consisting of the first or fundamental, fifth and octave of a certain musical fundamental tone without the third, said first set of tapes corresponding to twelve consecutive half tones of the chromatic scale;
(d) twelve manually operable keys, each for selecting one of said first set of tapes;
(e) means for reproducing the chords recorded on a selected tape of said first set, whereby one incomplete chord of twelve consecutive half tones can be reproduced at will;
(f) said melody reproducing part including a second set of a plurality of tapes, each having recorded thereon a particular tone played by a selected instrument;
(g) a corresponding plurality of keys for selecting a particular one of said second set of tapes; and



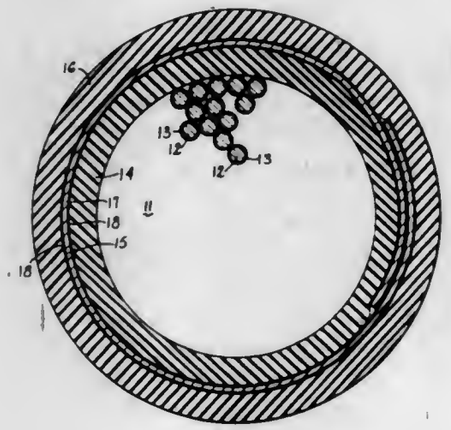
(h) means for reproducing the sound recorded on a selected one of said second set of tapes.

3,272,908
COMBINED COVER MEMBER AND MOUNT
Joel K. Beecher, Morristown, N.J., assignor to Tung-Sol Electric Inc., a corporation of Delaware
Filed July 17, 1964, Ser. No. 383,399
2 Claims. (Cl. 174—52)



1. A casing for an electrical device comprising, a unitary molded plastic member having an open end, a closed end, integral mounting lugs extending axially from the closed end, and an inner annular peripheral groove adjacent the open end, whereby when the electrical device which is to be received into said member has a base with the peripheral shape of said groove, the periphery of the base can be resiliently held in said groove.

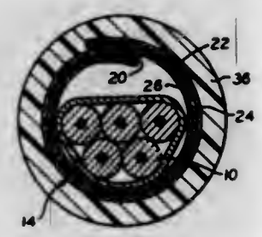
3,272,909
PRINTED CIRCUIT PACKAGE WITH INDICIA
George Bruck and John F. Freno, Cincinnati, Ohio, assignors to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed Nov. 4, 1964, Ser. No. 408,911
1 Claim. (Cl. 174—68.5)



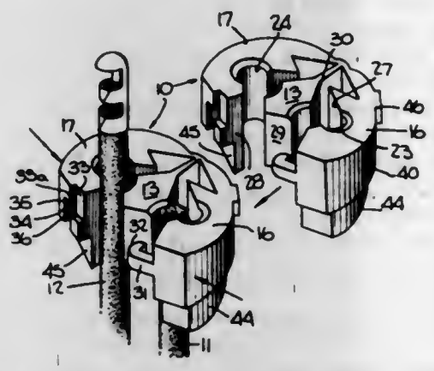
A circuit package comprising:
- a plurality of insulating laminates, each comprising a sheet of light-transmitting insulating material with at least one metallic marginal reinforcement;
- a plurality of circuit laminates each comprising a sheet of insulating material with metallic marginal reinforcements and an individually associated circuit pattern;
- the insulating sheets of said circuit laminates being formed with windows adjacent the ends of the associated circuit patterns;
- said ends being bent relative to the associated circuit laminates to form projecting tabs;
- the insulating sheets of said circuit laminates being formed with apertures as required to permit passage of non-associated tabs;
- said insulating laminates being formed with apertures as required to permit passage of projecting tabs;
- and the metallic marginal reinforcements being formed with aligned slots to permit reading of indicia on at least one of the sheets of insulating material.

3,272,910
BUOYANCY SYSTEM FOR UNDERWATER CONDUCTOR CABLE
Edward F. Flint, Fullerton, Calif., assignor to North American Aviation, Inc.
Filed Sept. 21, 1964, Ser. No. 398,014
2 Claims. (Cl. 174—101.5)

1. An underwater buoyancy cable for electrical conductors comprising a first flexible tubular member having a plurality of electrical conductors longitudinally disposed therein, a relatively large second flexible tubular member, said first tubular member longitudinally disposed within said second tubular member to form a longitudinal chamber between the outer surface of said first tubular member and the inner surface of said second tubular member, a third relatively small flexible tube extending longitudinally of said longitudinal chamber, and a plurality of cellular buoyancy members longitudinally disposed within said tubular member.



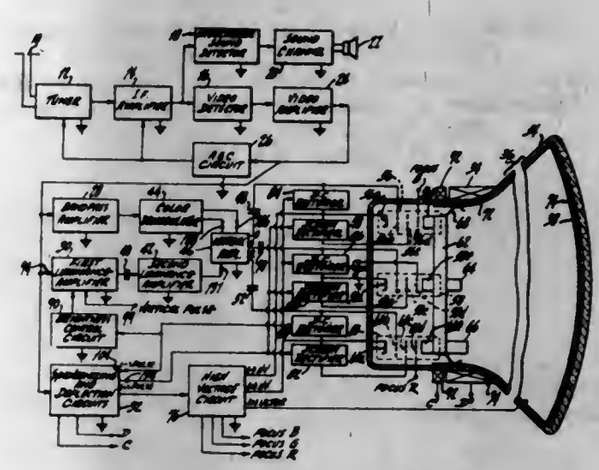
3,272,911
SHIELDED CABLE CONSTRUCTION
Gordon C. Rollins, Cumberland, and William A. Fallon, Riverside, R.I., assignors to The Ansonia Wire & Cable Company, Ashton, R.I., a corporation of Connecticut
Filed Apr. 14, 1964, Ser. No. 359,636
12 Claims. (Cl. 174—106)



1. A communication cable comprising a plurality of conductors forming a central core, an inner insulating jacket surrounding said core, a shield surrounding said inner jacket and an outer insulating jacket surrounding said shield, said shield comprising a first metal metallurgically bonded between two layers of a second metal, the total thickness of said second metal being no less than 10% of the total thickness of said shield.

3,272,912
FLEXIBLE TUBING AND THE MANUFACTURE THEREOF
Ludwik Jachimowicz, Elizabeth, N.J., assignor to General Cable Corporation, New York, N.Y., a corporation of New Jersey
Filed Feb. 1, 1965, Ser. No. 429,526
19 Claims. (Cl. 174—107)

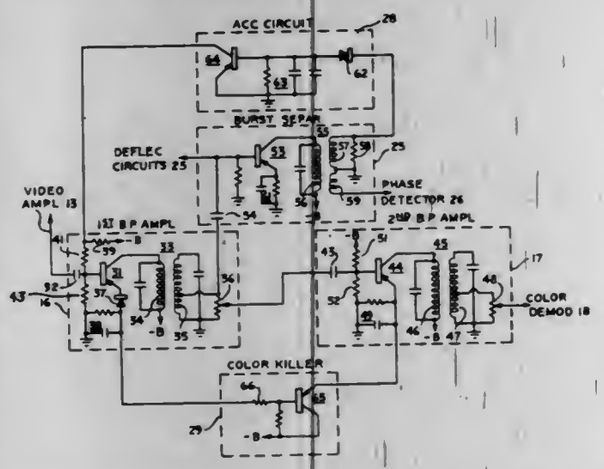
1. A jacketed electrical cable comprising a core of insulated conductors, a metallic strip co-extensive with the core and folded into tubular form thereabout, and an extruded jacket of plastic enclosing the tubular form, characterized by the fact that the said tubular form loosely encloses the core unsupported thereby, and by the further fact that the plastic is a thermoplastic material exhibiting a volume contraction of about 20% between extruding temperature and atmospheric temperature, and by the further fact that the plastic jacket is firmly bonded to the metallic strip at the interface so as to prevent relative movement between the jacket and the folded strip at the interface and thereby prevent collapse of the otherwise unsupported tubular form.



3,272,913
TWO-WIRE SOCKET INSULATOR
David J. Crimmins, Pennington, and Robert W. Croghan, Belle Mead, N.J., assignors to The Thomas & Betts Co., Inc., Elizabeth, N.J., a corporation of New Jersey
Filed Mar. 18, 1964, Ser. No. 352,779
7 Claims. (Cl. 174—138)

5. An insulator for a pair of electrically conductive elements comprising an abutment member having a pair of oppositely disposed sides each intersected by a relieved portion disposed therein, said relieved portions dividing each of said sides into two surfaces, and a pair of support members, each of said support members being pivotally attached to one end portion thereof and facing a different one of the opposite sides of said abutment member and being intersected by an additional relieved portion in a facing relationship with the relieved portion in the side of said abutment member adjacent thereto, each of said additional relieved portions dividing said support member into two additional surfaces, each support member when positioned apart from said abutment member being adapted to receive a conductive element therebetween and when positioned with said additional surfaces contiguous with said surfaces of said abutment member being adapted to retain said conductive element therebetween.

3,272,914
DIRECT-CURRENT RESTORER SYSTEM FOR COLOR TELEVISION RECEIVER
Warren H. Moles, Trenton, N.J., and Roland N. Rhodes, Levittown, Pa., assignors to Radio Corporation of America, a corporation of Delaware
Filed Nov. 20, 1961, Ser. No. 153,287
9 Claims. (Cl. 178—5.4)



1. In a color television receiver having a source of luminance signal, including vertical and horizontal blanking intervals, a luminance signal processing circuit, the combination comprising:
- a cathode ray tube having a light emitting phosphor screen and a plurality of electron guns, each of said guns having at least a cathode and a control electrode;
- power supply means for said receiver to supply operating potentials to said cathode ray tube for maintaining the cathodes of said electron guns at substantially different direct operating potentials;
- a luminance signal translating circuit having a signal input circuit and a signal output circuit;
- means for applying said luminance signal from said source of luminance signal to the signal input circuit of said luminance signal translating circuit and to derive a luminance signal in the signal output circuit of said luminance signal translating circuit;
- a source of first pulse signals occurring at the rate of the horizontal blanking intervals of said luminance signal;
- means for applying said first pulse signals to said luminance signal translating circuit to prevent signal translation therethrough during the application of said first pulse signals to incorporate into said luminance signal a first pulse portion occurring at the rate of said horizontal blanking intervals;
- a source of second pulse signals occurring at the rate of the vertical blanking intervals of said luminance signal;
- means for applying said second pulse signals to said luminance signal translating circuit to prevent signal translation therethrough during the occurrence of said second pulse signals to incorporate a second pulse portion into said luminance signal occurring at the rate of said vertical blanking intervals;
- a plurality of signal coupling means for applying said luminance signal, including said first and second

pulse portions, between the control electrodes and cathodes of the electron guns of said cathode ray tube; and

a plurality of direct current restoring means each connected individually between said control electrode and the cathode of one of said electron guns of said cathode ray tube for providing a bias voltage between said control electrode and cathode of each of said electron guns and for clamping the peaks of the first and second pulse portions of said luminance signal at said bias voltage such that cathode current in said electron guns is cut off during the occurrence of said first and second pulse portions of said luminance signal.

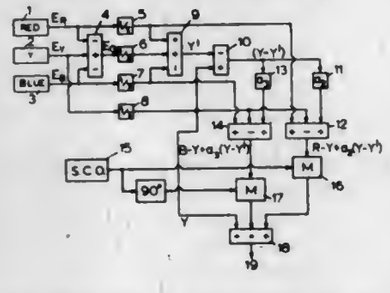
3,272,915
COLOR TELEVISION RECEIVER INCLUDING TRANSISTORIZED COLOR KILLER
Gerald E. Theriault, Hopewell, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Apr. 2, 1962, Ser. No. 184,157
10 Claims. (Cl. 178—5.4)

1. In a television receiver adapted to receive both color and black and white television signals, said color signal including a chrominance video signal component in the form of a phase and amplitude modulated subcarrier wave of a given frequency and color synchronizing bursts comprising several cycles of said subcarrier wave frequency and having a fixed amplitude, the combination comprising:

a first transistor amplifier provided with input and output circuits and having said composite television signal impressed upon its input circuit and adapted to amplify and develop in its output circuit substantially only signals in the frequency range of said subcarrier wave and its modulation sidebands;

a second transistor amplifier provided with input and output circuits and having its input circuit coupled to the output circuit of said first transistor amplifier and adapted to amplify and develop in its output circuit substantially only signals in the range of said subcarrier wave and its modulation sidebands;

means coupled to said first transistor amplifier to develop a unidirectional control signal representative of the amplitude of said color synchronizing bursts;



means to impress said control signal on the input circuit of said first transistor amplifier to vary its gain inversely to the amplitude of said color synchronizing bursts;

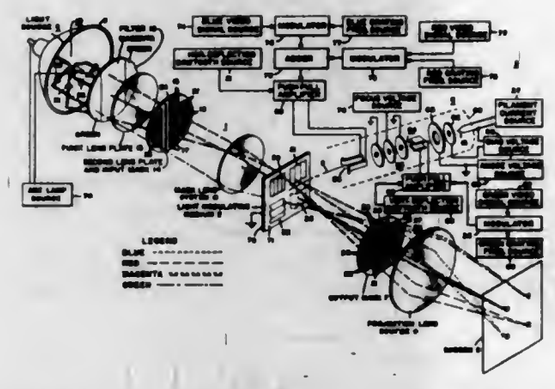
a color killer circuit including a color killer transistor;

means responsive to current flow in said first transistor amplifier to bias said color killer transistor so that the current in said first transistor amplifier produced in the absence of said modulated subcarrier wave effects current conduction of a first magnitude in said color killer circuit and so that the current in said first transistor amplifier produced in response to a modulated subcarrier wave effects current conduction of a scond magnitude in said color killer circuit; and

means responsive to current flow in said color killer circuit to bias said second transistor amplifier so that said second transistor amplifier is rendered in operative in response to said first magnitude of current conduction in said color killer circuit and is rendered operative to amplify said chrominance video signal component in response to said second magnitude of current conduction in said color killer circuit.

3,272,916
COLOR TELEVISION SYSTEMS UTILIZING A TRUE LUMINANCE SIGNAL
Ivanhoe John Penfound James and Wieslaw Antoni Karwowski, London, England, assignors to Electric & Musical Industries Limited, Hayes, England, a company of Great Britain
Filed May 14, 1963, Ser. No. 280,293
Claims priority, application Great Britain, May 16, 1962, 18,771/62; June 15, 1962, 23,013/62
6 Claims. (Cl. 178—5.4)

1. A colour television system comprising means for producing a video waveform representing a picture to be transmitted including means for generating a relatively wide frequency band luminance signal of the form

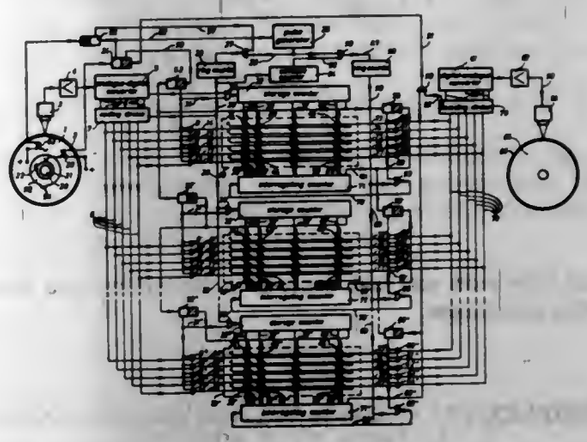


$$(E_Y)^{1/\gamma}-a_1A_1$$

wherein E_Y is a signal of the form obtainable from a monochrome television camera, and means for generating two relatively narrow frequency band colour signals of the form $R_D+a_2A_2$ and $B_D+a_3A_3$ wherein R_D and B_D are colour difference signals, A_1, A_2 and A_3 are signals which are zero for uncoloured portions of the picture and increase with the increase of the product of colour saturation and luminance, and a_1, a_2 and a_3 are numerical constants which have selected magnitudes and signs to allow three substantially correct primary colour control signals to be derived by linear operations on said luminance signal and said colour signals, means for generating a composite video waveform responsive to said luminance signal and said colour signals, and means for modulating a carrier oscillation by said video waveform.

3,272,917
FIRST AND SECOND ORDER DIFFRACTION COLOR PROJECTION SYSTEM
William E. Good, Liverpool, Thomas T. True, Camillus, and Henry J. Vanderlaan, Liverpool, N.Y., assignors to General Electric Company, a corporation of New York
Filed Feb. 11, 1964, Ser. No. 343,990
13 Claims. (Cl. 178—5.4)

1. The combination in a light diffraction system of a transparent light modulating medium formable into diffraction gratings by electric charges deposited thereon, means to direct an electron beam upon said medium to produce such electric charges in said medium, means to deflect said beam in one direction at successively spaced distances over said medium to form a raster thereon,



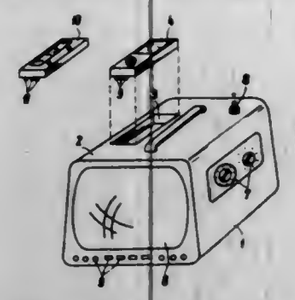
means for modulating said beam with a signal of a fixed frequency corresponding to the one of a pair of primary color components of a color image having the longer wave lengths and an amplitude varying in accordance with the point to point intensity of said color component in said image to form in said medium a diffraction grating, the spacing between adjacent lines thereof being dependent on said frequency, means for simultaneously modulating said beam with another signal of another fixed frequency lower than said one fixed frequency corresponding to said other primary color component of said color image and amplitude varying in accordance with the point to point intensity of said other color component in said image to form in said medium another diffraction grating having lines oriented parallel to the lines of said one grating, the spacing between adjacent lines of said other grating being de-

pendent upon said other frequency, said diffraction gratings forming in said medium a third diffraction grating the spacing between adjacent lines of which correspond to a frequency which is the difference of said fixed frequencies, said difference being less than either of said fixed frequencies, said gratings diffracting light in a direction orthogonal to the lines thereof, a mask having an opaque portion and a transparent portion, said transparent portion having an extent in said orthogonal direction and so positioned as to pass first order light of said one color component and second order light of said other color component therethrough, said mask having another transparent portion spaced in said orthogonal direction on said mask so as to pass all of the first order light of said two color components diffracted by said third diffraction grating and to pass first order light of said other color component diffracted by said other grating.

3,272,918
METHOD OF AND APPARATUS FOR RECORDING PICTURE SIGNALS, OBTAINED BY SCANNING PICTURE ORIGINALS TO BE REPRODUCED, WITH STEADILY VARIABLE REPRODUCTION SCALE
Roman Koll, Kiel-Wellingdorf, and Fritz-Otto Zeyen, Kitzeberg, near Kiel, Germany, assignors to Dr.-Ing. Rudolf Hell Kommanditgesellschaft Kiel, a German company
Filed Dec. 23, 1964, Ser. No. 420,832
Claims priority, application Germany, Dec. 27, 1963, H 51,239
17 Claims. (Cl. 178—6.6)

1. A method of recording picture signals obtained by scanning picture originals to be reproduced, with continuously variable reproduction scale, using rotating drums for tensioning the picture original and the recording carrier, comprising the steps of rotating the drums at the same speed, scanning a picture original on the one drum to translate such picture original into a series of picture signals, storing the picture signals, reading out the stored picture signals, recording a picture reproduction on a recording carrier on the drum by means of said read-out picture signals, adjusting the relative speeds at which the storage and subsequent read-out of the picture signals

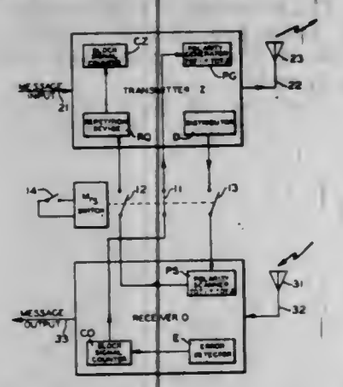
take place, dependent upon a selected line density, to provide a desired reproduction ratio between the picture original and the reproduction thereof.



3,272,919
TELEVISION FADER AMPLIFIER
Gordon B. Thompson, Ottawa, Ontario, Canada, assignor to Northern Electric Company Limited, Montreal, Quebec, Canada
Filed Nov. 15, 1963, Ser. No. 324,119
8 Claims. (Cl. 178—7.1)

1. A television fader amplifier comprising input means for an at least semi-composite video signal, means for subtracting set-up from said signal, means for amplifying the remainder signal after said subtraction, means for clamping the amplified remainder signal to a reference voltage during blanking intervals to produce a clamped non-composite signal of selected amplitude, and means for combining said non-composite signal with set-up and sync pulses of known amplitude to generate a composite output signal.

3,272,920
PORTABLE TELEVISION RECEIVER INCLUDING MEASURING DEVICE
Heinz-Hubert Meurer, Kronach, Upper Franconia, Germany, assignor to Loewe Opta G.m.b.H., Berlin, Germany, a company of Germany
Filed Apr. 29, 1965, Ser. No. 452,461
Claims priority, application Germany, May 6, 1964, Reg. No. (utility model) 1,902,049
4 Claims. (Cl. 178—7.9)

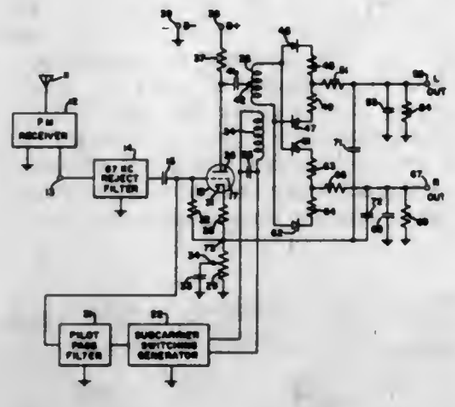


1. A portable television set in combination with an instrument for measuring field strength received with said television set; said measuring instrument having contact elements for electrical connection with the receiver cir-

cuit, said contact elements engaging with corresponding opposed contact elements disposed in a depression of

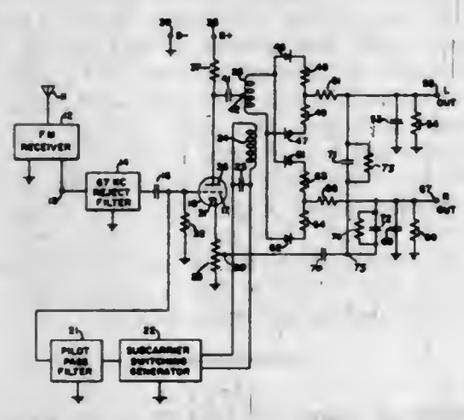
said television set, said depression containing said measuring instrument.

3,272,921
SIMPLEX TELEGRAPH SYSTEM FOR SCANNING ANSWER-BACK SIGNALS
Hendrik Cornelis Anthony van Duuren, Wassenaar, Netherlands, assignor to de Staat der Nederlanden ten Deze Vertegenwoordigd Door de Directeur-Generaal der Posterijen, Telegrafie en Telefonie, The Hague, Netherlands
Filed Nov. 1, 1962, Ser. No. 234,746
Claims priority, application Netherlands, Nov. 3, 1961, 271,031/61
14 Claims. (Cl. 178—69)



1. In a telecommunication system for transmitting intermittent groups of message signals from one station to another and transmitting answer-back signals from said other station to said one station during the space between the transmission of adjacent groups of message signals, said answer-back signals being of two types and indicating that said other station correctly received the just prior group of message signals and that the next group should now be transmitted, the improvement comprising the steps of:

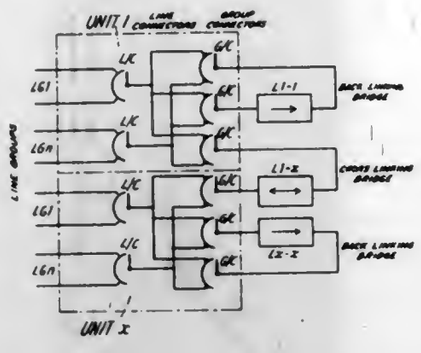
(A) transmitting the proper one of said answer-back signals from said other station continuously from the end of the reception of each said group of signals to substantially the end of the time between that group and the next adjacent group of signals, and



(B) scanning said answer-back signals in said one station for at least a part of said space between the transmission of adjacent message signals.

3,272,922
RECEIVER CIRCUIT FOR STEREO SEPARATION
Robert M. Linz and Antal Csicsatka, Utica, N.Y., assignors to General Electric Company, a corporation of New York
Filed Dec. 31, 1963, Ser. No. 334,941
5 Claims. (Cl. 179—15)

1. In a reception circuit having a stereo demodulation circuit for deriving L and R stereo output signals from a composite signal comprising an $L+R$ signal component and $L-R$ sidebands, in which the L output signal tends to contain an undesired component of R signal and the R output signal tends to contain an undesired component of L signal, means for improving the stereo separation of said L and R output signals, comprising first compensation means connected and adapted to substantially reduce the amplitudes of said undesired components in a first part of the audio frequency range, and second compensation means connected and adapted to substantially reduce the amplitudes of said desired components only in a second part of the audio frequency range.



3,272,923
RECEIVER CIRCUIT FOR STEREO SEPARATION
Antal Csicsatka, Utica, N.Y., assignor to General Electric Company, a corporation of New York
Filed Dec. 31, 1963, Ser. No. 334,942
4 Claims. (Cl. 179—15)

1. In a reception circuit having a stereo demodulator circuit for deriving L and R stereo output signals from a composite signal comprising an $L+R$ component and $L-R$ sidebands, in which the L output signal tends to contain an undesired component of R signal and the R output signal tends to contain an undesired component of L signal, said undesired components having relatively greater amplitudes of relatively higher audio frequencies, means for improving the stereo separation of said L and R output signals, comprising a signal cancellation network arrangement conpected to apply an arithmetical combination of L and R signals which is derived from the composite signal to said L and R output signals in a phase tending to cancel said undesired components, said network arrangement having the characteristic of passing the higher audio frequencies with greater amplitude than the lower audio frequencies, whereby good stereo separation of the L and R output signals is achieved over the entire audio frequency range.

3,272,924
AUTOMATIC TELECOMMUNICATION SWITCHING SYSTEMS
Bloomfield James Warman, Charlton, London, England, assignor to Associated Electrical Industries Limited, London, England, a British company
Filed July 6, 1961, Ser. No. 122,137
Claims priority, application Great Britain, July 18, 1960, 25,065/60, Patent 989,336
34 Claims. (Cl. 179—18)

1. A switching arrangement for an automatic telecommunications exchange comprising switching equipment permitting selective establishment of communication path between lines connected to the exchange, a plurality of switching sections constituted by respective sub-divisions of said switching equipment, connections affording access of each line to a plurality of said sections, the switching equipment in each section affording a plurality of selectable routes through it as portions of such communication paths, the routes through each section being separate from an independent of the other sections, a plurality of links connected to the switching sections and co-operating therewith in providing between any two of said lines a plurality of possible communication paths each comprising incoming and outgoing portions interconnected by one of said links with the incoming portions of the several paths extending over respective routes in different sections and likewise the outgoing portions of the several paths extending over respective routes in different sections and a section selecting arrangement comprising means operable in respect of a call between two lines for ascertaining pertinent conditions in the several sections, means for selecting from said path portions in accordance with the so ascertained conditions an incoming path portion and an outgoing path portion for a communication path between the call lines, and means for establishing this communication path over the selected path portions and the link which interconnects them.

3,272,925
CODED DISK REPERTORY TELEPHONE DIALER
Robert I. Worley, 4011 Sinclair, and Gaston K. Worley, 511 Bowser, both of Austin, Tex.
Filed June 11, 1962, Ser. No. 201,522
4 Claims. (Cl. 179—90)

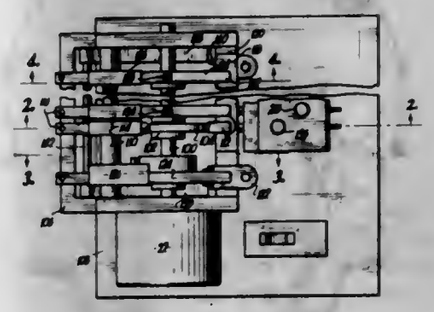
2. In an automatic telephone dialer:

a source of electrical power;

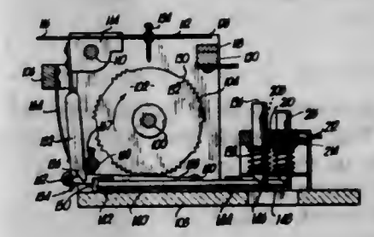
a support;

a shaft rotatably mounted on said support;

electrical power means coupled with said shaft for rotating the latter;



a plurality of dialing cams having raised and depressed camming surfaces thereon representing a corresponding plurality of preselected telephone numbers, said dialing cams being mounted on said shaft for rotation therewith and axially spaced therealong;



electrical contact means mounted on said support;

a plurality of electrically conductive cam followers, each of the latter being shiftably mounted on said support and normally disengaged from the camming surfaces of a corresponding cam, each follower being responsive to its corresponding cam, upon movement into engagement therewith and rotation of said shaft, to alternately engage and disengage said electrical contact means;

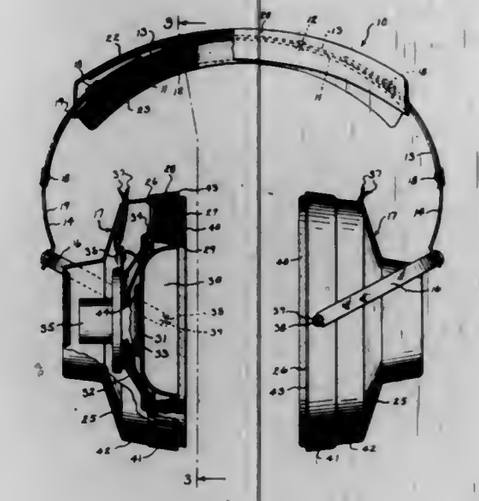
terminal means electrically interconnecting said followers;

shiftable means coupled with said followers for moving a selected follower into engagement with the camming surfaces of the corresponding cam upon actuation of said shiftable means;

switch means electrically intercoupling said power source and said power means and normally preventing energization of the latter, said switch means being responsive to said actuation of the shiftable means for effecting energization of said power means to thereby rotate said shaft, whereby the selected follower alternately engages and disengages said contact means during a dialing period to alternately close and open the electric circuit from said contact means to said terminal means to produce dialing impulses corresponding to the preselected telephone number; and

reset means rotatable with said shaft and operable to engage said shiftable means at the end of said dialing period to effect return movement of the selected follower to its normal position, whereby to de-energize said power means and thereby maintain the dialer in condition for subsequent actuation of the shiftable means to again dial a preselected telephone number.

3,272,926
HEADPHONE ASSEMBLY
Gustave F. Falkenberg, Brookfield, Wis., assignor to Dimensional Products, Inc., Milwaukee, Wis., a corporation of Wisconsin
Filed Apr. 24, 1963, Ser. No. 275,425
4 Claims. (Cl. 179—182)

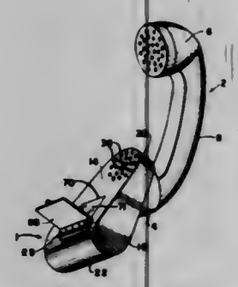


1. In a headphone for a headset, the combination of:

an outer shell forming a housing that has a peripheral rim defining an open end, said rim having apertures at two oppositely disposed points;

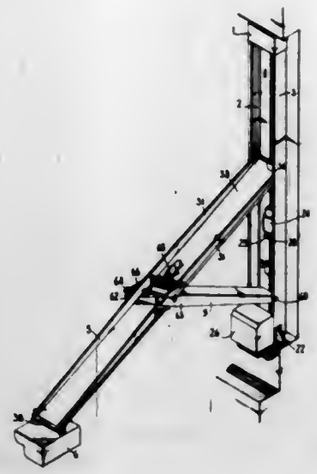
an earcup extending over the open end of said outer shell and including a peripheral wall nesting within the peripheral rim of said outer shell and having

apertures at two points each in alignment with an aperture in the outer shell, a depressed panel portion inward of and adjacent to said peripheral wall, an inner ridge defining the inner extent of said panel portion and forming a channel with said panel portion and said peripheral wall, and an ear receiving cavity to the inside of said inner ridge;



a speaker within said headphone and mounted upon the rear of said earcup panel portion;

a resilient cushion disposed in said channel; and



a resilient bail with ends inserted through the aligned apertures in the peripheral rim of said outer shell and the peripheral wall of said earcup, which bail ends are urged toward one another by the resilience of the same.

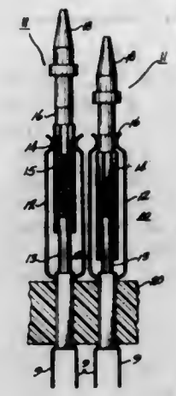
3,272,927
TELEPHONE STERILIZING ATTACHMENT
John G. Peebles, 117 Charles St., New York, N.Y.
Filed Sept. 3, 1963, Ser. No. 306,248
9 Claims. (Cl. 179—185)

3. An attachment for a telephone instrument having transmitting and receiving portions, comprised of a hollow casing including means for connecting said casing to either said transmitting and receiving portions, a germicidal lamp extending within said casing, one surface of said casing having an opening therein for emitting light emanating from said lamp, closure means removably associated with said opening to thereby enable selective exposure or closure of said opening, said casing being provided with a plurality of apertures disposed through said one surface, said apertures being positioned opposite said means for connecting said casing, light emitted by said lamp being incident with respect to said apertures and said opening.

3,272,928
APPARATUS FOR ELECTRICAL AND FLUID CONNECTION
Jean Hainzelin, Paris, France, assignor to Electricite de France—Service National, Paris, France
Filed Feb. 25, 1963, Ser. No. 260,405
Claims priority, application France, Mar. 7, 1962, 890,320
3 Claims. (Cl. 191—1)

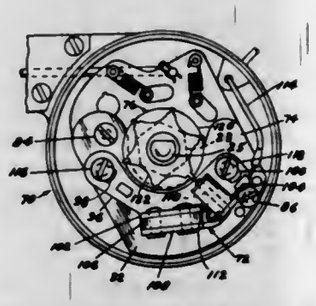
1. Apparatus for articulation of a supporting arm and a connecting arm to maintain a connector in position, irrespective of the angle of inclination of the supporting arm, on a moving machine comprising a laterally moving frame, a supporting arm, a coupling connector, one end of said supporting arm being slidably mounted on said frame and the other end of said supporting arm supporting said coupling connector, a connecting arm pivotally mounted between said supporting arm and said frame for setting the angle of inclination of said supporting arm with respect to said frame, means for articulation of said connecting arm mounted on said supporting arm, means for controlling the pivoting of said connecting arm and the translation of said coupling connector perpendicularly to said frame, means for synchronizing the angular movement of said coupling connector with the movement of said supporting arm and for maintaining said coupling connector in a predetermined position irrespective of the angle of inclination of said supporting arm, said means for articulation of said connecting arm including a motor mounted on said supporting arm, spaced threaded rods rotated by said motor, nuts on said connecting arm receiving said rods one of said rods and the associated one of said nuts being disposed on each side of said supporting arm and a micro-contact breaker connected to said motor controlling the rotation of said rods in synchronism with the movement of said coupling connector.

3,272,929
CARD READER SWITCH WITH INSULATED CYLINDRICAL FLUTED PORTION AND SMALLER CONCENTRIC CYLINDRICAL CONTACT PORTION
Emil A. Hacker, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed Sept. 2, 1964, Ser. No. 394,004
3 Claims. (Cl. 200—1)



1. Sensing apparatus having yieldably biased switching means, said means comprising in combination:

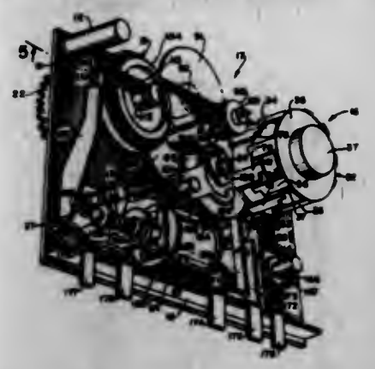
(a) reciprocating contact means including:



(1) a cylindrical longitudinally fluted electrical insulating portion in combination with

(2) a smaller diameter cylindrical electrical conducting portion, said cylinder portions sharing a common longitudinal axis; and

(b) a set of electrical contact means disposed to slide along the surface of said reciprocating contact means, said set of electrical contact means comprising at least two members of such configuration that under open circuit conditions only a first portion of said at least two members makes contact with said cylindrical longitudinally fluted electrical insulating portion of said reciprocating contact means and under closed circuit conditions only a second portion of said at least two members makes contact with said smaller diameter cylindrical electrical conducting portion of said reciprocating contact means.



3,272,930
MAGNETIC PULSE GENERATOR IGNITION DISTRIBUTOR
Robert K. Frank, Mount Clemens, Mich., assignor to Holley Carburetor Company, Warren, Mich., a corporation of Michigan
Filed Sept. 18, 1963, Ser. No. 309,790
5 Claims. (Cl. 200—19)

1. A pulse wheel assembly for converting a breaker contact type ignition distributor having a multi-lobe cam formed on the shaft thereof to a magnetic pulse type distributor, said pulse wheel assembly comprising a resilient tubular member adapted to be applied to the outer periphery of the cam by stretching the same over said cam, and a magnetically permeable member having a generally circular portion and equally spaced prongs extending axially from the periphery thereof, said permeable member being adapted to be applied over the said resilient member once said resilient member has been applied to the outer periphery of the cam and in a manner so that said generally circular portion is parallel to an end face of the cam and so that said prongs retain said permeable member on the cam by compression of said resilient member.

3,272,931
TIMER MECHANISM HAVING CAM-SOLENOID ACTUATOR AND COMMON COIL FOR SOLENOID AND MOTOR
Roger D. Ruisch, Two Rivers, Wis., assignor to American Machine & Foundry Company, a corporation of New Jersey
Filed Sept. 24, 1963, Ser. No. 311,064
6 Claims. (Cl. 200—35)

1. An electrical timer including in combination

a clock mechanism including a synchronous electric timing motor, said motor having pole pieces for the transmission of the magnetic field required for operation of said motor;

a timing cam mounted for rotation about its axis from a first rotary position toward a second rotary position;

biasing means normally biasing said timing cam toward said first rotary position;

means to permit adjusting one of said rotary positions of said timing cam;

a clutch surface fixedly connected to said timing cam;

the combination of said timing cam and said clutch surface shiftable from a disengaged position to an engaged position in which said clutch surface engages said clock mechanism so that said timing cam is driven from said first rotary position toward said second rotary position when said timing motor is operating;

means normally biasing the combination of said timing cam and said clutch surface toward said disengaged position;

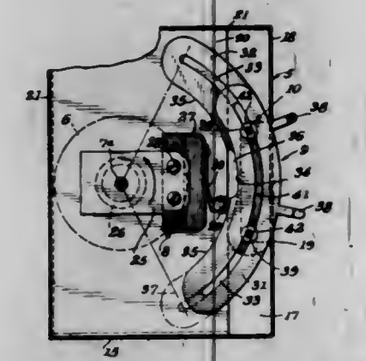
a solenoid;

means magnetically coupling said motor pole pieces to said solenoid to provide the magnetic field for said motor when said solenoid is energized with alternating current;

switch actuating means engaging said cam when said solenoid is energized, and movable to a switch actuating position when said timing cam is in said second rotary position;

an armature magnetically coupled with and actuatable by said solenoid upon energization of said solenoid with alternating current; and

means operable in response to actuation of said armature to move said combination of timing cam and clutch surface to said engaged position.



3,272,932
CYCLE TIMER WITH ADJUSTABLE ARCUATE CAMS
David L. Radford, Salt Lake City, Utah, assignor to McGraw-Edison Company, Elgin, Ill., a corporation of Delaware
Filed Sept. 22, 1964, Ser. No. 398,188
5 Claims. (Cl. 200—38)

5. In a cycle timer having a bank of electric switches with actuator rollers and mounted to move in an arcuate path around an axis and provided with means to move said bank in one direction to an elevated position,

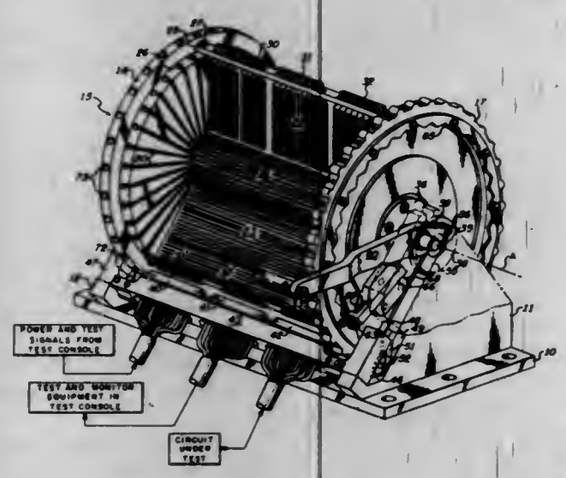
means to engage said switch rollers to open and close said switches comprising:

(a) a bank of arcuate cams formed on a curve having its center on said axis,

(b) each said cam comprising two similar cam members in face-to-face relation and having a concave cam edge with a relief portion, said relief portions of the two cam members combining to form a relief recess,

(c) said switch rollers being resiliently biased to bear against and ride over said concave edges of the cam members,

(d) means to adjustably fixedly mount said cams, and



(e) spring means to bias the switch bank to return position in the opposite direction.

3,272,933

ROTARY INDEXING PROGRAMMER SWITCH USING CIRCUIT BOARDS

Billy J. Henderson, Clearwater, Fla., assignor to Sperry Rand Corporation, Great Neck, N.Y., a corporation of Delaware

Filed July 10, 1964, Ser. No. 381,847
3 Claims. (Cl. 200—46)

2. Apparatus for compactly storing and rapidly and accurately selecting any one of a plurality of pre-constructed electrical circuit boards comprising,

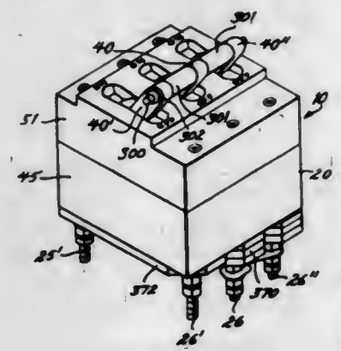
a reel rotatable about its central axis,

a plurality of planar members each supporting electrical circuit means thereon,

said planar members being supported by said reel and being disposed radially in spaced angular relationship about and axis,

electrical terminal means disposed along the outermost edge of each of said planar members and providing circuit connections to the electrical circuit means on the respective planar members,

at least one electrical connector plug disposed at a fixed angular position beyond the outermost edge of said planar members and aligned for insertion into contact with the terminal means on a planar member positioned at said fixed angular position,



means imparting a linear radial motion to said connector plug to move said plug inwardly and outwardly to insert and withdraw it into and from engagement with the terminal means of a radially aligned planar member.

3,272,934

CIRCUIT BREAKER UNIT FOR ABNORMALLY HIGH INRUSH CURRENTS AND/OR INRUSH CURRENTS OF LONG DURATION

Norman J. Schwartz, Yardley, Pa., Norman E. Taylor, West Trenton, and Hal H. Bakes, Browns Mills, N.J., assignors to Heinemann Electric Company, Trenton, N.J., a corporation of New Jersey

Filed Dec. 30, 1963, Ser. No. 334,108
9 Claims. (Cl. 200—50)

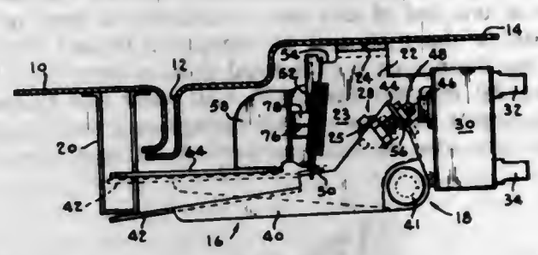
7. A circuit breaker unit comprising first and second circuit breaker means for controlling a load, said first circuit breaker means comprising an electromagnetic tripping device controlling said load for a predetermined time period subsequent to initial energization, said second circuit means comprising another electromagnetic tripping device controlling said load at the end of said time period, both means including handles connected for joint movement to the contacts closed and open positions, the first means further comprising a collapsible mechanism connected to its handle and actuatable by said first mentioned tripping device, whereby at the end of said predetermined time period the contacts of the first means move to the contacts open position, since its mechanism remains collapsed, but the handle thereof remains in its contacts closed position because of the connection between the handles.

3,272,935

REMOTELY OPERATED LATCH MECHANISM FOR LAUNDRY MACHINES

Wilbert E. Beller, Park Ridge, and Edwin A. Ostrowski, Mount Prospect, Ill., assignors to Controls Company of America, Melrose Park, Ill., a corporation of Delaware

Filed Jan. 10, 1964, Ser. No. 336,991
8 Claims. (Cl. 200—61.7)



1. A latch mechanism comprising, in combination,

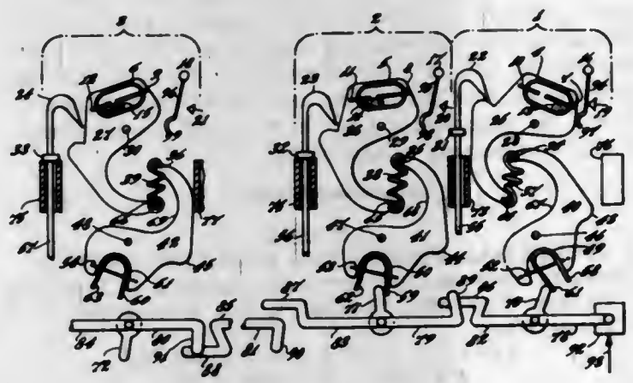
support means including a generally planar portion,

switch means connected on one side of said planar portion and electrically actuated means connected on the other side thereof, said switch means connected in circuit with said electrically actuated means and operative, when actuated, to set-up a circuit to said electrically actuated means the completion of which energizes said electrically actuated means,

actuating means for said switch means pivotally mounted on said planar portion for movement in a plane parallel to said planar portion to actuate said switch means,

said support means including a portion extending laterally of said planar portion on said other side thereof,

and a first latch member having one end positioned adjacent said switch actuating means, its other end positioned adjacent said electrically actuated means and being pivotally supported intermediate its ends on said lateral portion for movement transversely of said plane,



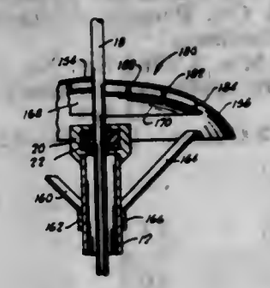
said electrically actuated means operative when actuated to pivot said first latch member.

3,272,936

DIRECTION OF ROTATION RESPONSIVE BISTABLE SWITCH MECHANISM

James A. Potter, 12 Greenhouse Blvd., West Hartford, Conn.

Original application Feb. 24, 1964, Ser. No. 346,630, now Patent No. 3,224,518, dated Dec. 21, 1965. Divided and this application May 3, 1965, Ser. No. 465,226
2 Claims. (Cl. 200—67)



1. A bistable switch mechanism indicating the direction of rotation of an associated finger, said switch consisting essentially of: a pair of pivoted members, each member being pivoted for limited arcuate movement; a spring connecting portions of each of the pair of pivoted members and yieldingly permitting the shifting of the pair of pivoted members to and from a stable position designated as an advanced position and a stable position designated as a withdrawn position but normally urging the pivoted members toward such a stable position; a U-shaped spring in a slot in one of the pivoted members, said spring having two spring tips extending from such slot, a spring tip yieldingly flexing during the continued rotation of an associated finger in the direction corresponding to the position of the bistable switch, and a spring tip being actuated to shift the bistable switch to the position corresponding to the direction of rotation of the finger when contacted by the initial rotation of the finger through a contact zone in a direction opposite to that corresponding to the position of the bistable switch; and an electrical switch operatively shifted by the shifting of the pair of pivoted members.

3,272,937

AUTOMATIC SHUTDOWN DEVICE FOR PUMPING UNITS

John A. Queen, Hobbs, N. Mex., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware

Original application Nov. 5, 1962, Ser. No. 235,325, now Patent No. 3,211,848, dated Oct. 12, 1965. Divided and this application Mar. 29, 1965, Ser. No. 443,411
4 Claims. (Cl. 200—81)

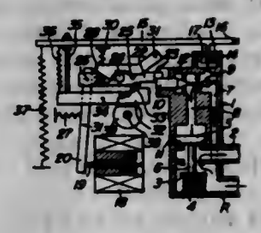
1. A shutdown device for automatically disabling a pumping unit having a prime mover which drives a rod member extending through a stuffing box, the shutdown device comprising:

baffle means adapted to be disposed substantially around the rod member adjacent the stuffing box;

impact plate means connected to the baffle means and adapted to be disposed adjacent the stuffing box so as to be impacted by fluid sprayed from the stuffing box;

switch means disposed between the baffle means and the impact plate means adapted to be actuated upon impact of fluid against the impact plate means; and

circuit means adapted to be connected to the switch means and to the prime mover for disabling the prime mover upon actuation of the switch means,

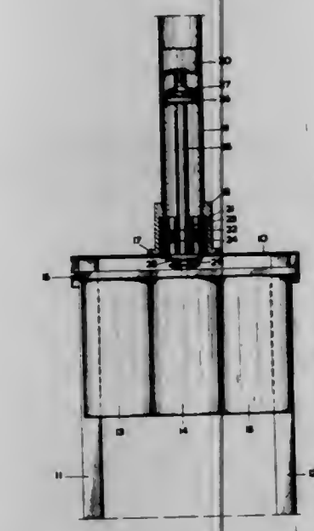


whereby upon leakage of fluid through the stuffing box the pumping unit will be shut down.

3,272,938

CONTROL VALVE MEANS FOR AIR OPERATING ELECTRIC SWITCH

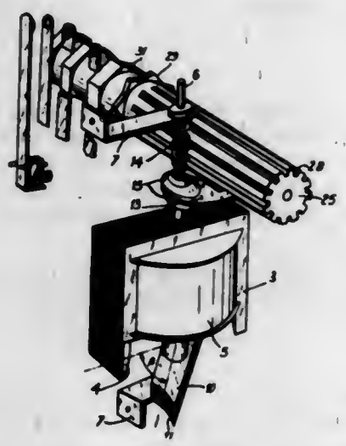
Seizo Nakano and Haruji Nakano, Hitachi-shi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan



Filed Jan. 14, 1964, Ser. No. 337,616
Claims priority, application Japan, Jan. 16, 1963, 38/1,248
14 Claims. (Cl. 200—82)

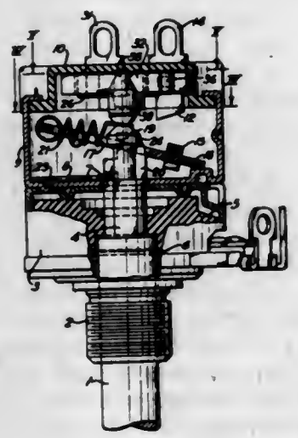
1. Control valve means for a fluid operated electric switch and a fluid pressure source, comprising: main valve means controlling the flow of fluid from the fluid pressure source to the electric switch; control valve means controlling the operation of said main valve means; operating means responsive to a first electric switching signal for operating said control valve means to a control position; means for maintaining said control valve means at said control position until the operation of the electric switch corresponding to said switching signal has been completed; and means for rendering said operating means ineffective to operate said control valve means in re-

sponse to any electric signal after the completion of the operation of the electric switch corresponding to said switching signal.



3,272,939
SINGLE OR THREE-PHASE LOAD-BREAKING SWITCH WITH PERMANENT MAGNET ACTUATOR ASSEMBLY
Jan Christiaan Clason, Hengelo, Netherlands, assignor to N.V. Fabriek van Electrische Apparaten Voorheen F. Hazemeijer & Co., Hengelo, Netherlands, a corporation of the Netherlands
Filed Mar. 3, 1964, Ser. No. 349,094
Claims priority, application Germany, Mar. 4, 1963, N 22,844
2 Claims. (Cl. 200—82)

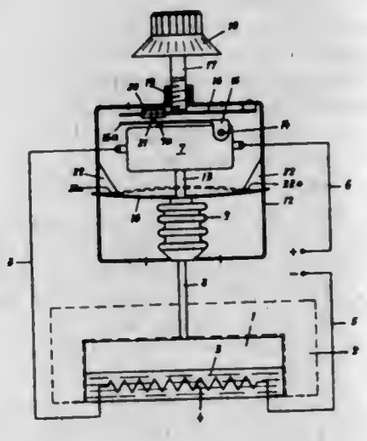
1. An actuator assembly system for a load-breaking isolator switch comprising a movable hood assembly adapted to contain switch contacts which may be opened and closed by movement of the hood between two limiting positions, a housing for conveying controllable pneumatic pressure, a piston reversibly movable within said housing responsive to said pressure, a piston rod rigidly connected to both the movable hood assembly and the piston to move the hood between said limiting positions responsive to the pneumatic pressure, a permanent magnet system affixed within said housing to intercept respectively the path of said piston and said hood near corresponding ones of the two limiting positions, and two plates of magnetically soft material affixed to said piston rod respectively near the hood and piston to move therewith and intercept said permanent magnet system to magnetically engage the permanent magnet system at the respective limits and hold said piston rod in place wherefrom the contacts may be changed by breaking the plates away from the magnet quickly only after said pneumatic pressure is changed on said piston to an extent exceeding the holding force of the magnet on said plates.



3,272,940
ELECTROMAGNETIC DEVICE, MORE PARTICULARLY FOR USE WITH CONTACTORS, RELAYS AND TELEBREAKERS
Pierre Franck, 53 Ave. de Trudaine, Paris, France
Filed Mar. 31, 1964, Ser. No. 356,236
Claims priority, application France, June 19, 1963, 938,636
9 Claims. (Cl. 335—122)

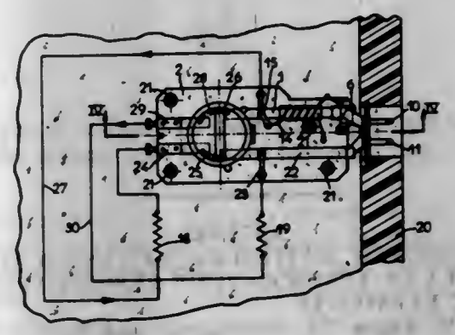
1. An electromagnetic device for rotating intermittently a mechanical member comprising in combination a solenoid type coil having a vertical axis, two pole-pieces arranged in diametrically opposed adjacent positions with respect to said coil, a movable assembly having a vertical shaft extending beyond said coil, a plunger core connected with said shaft adapted to move axially and rotatably within said coil, and a transverse armature member carried at one end of said core, a mechanical drum member rotatable about an axis perpendicular to said shaft and having flutings on a cylindrical portion thereof, an operating flat member carried by said shaft and shaped for engaging at least one of said flutings in a position spaced from the axis of said mechanical member, means for

energizing said coil and causing an axial movement of said plunger core and shaft thus moving axially said operating member towards the horizontal diametral plane of said mechanical member, whereby the relative movement of said fluting with respect to said shaft causes the initial rotation of said shaft by a pushing action of said fluting against said operating member in a direction which reduces the angular gap between said armature and said pole pieces, thus permitting the electromagnetic flux between the pole pieces and the armature to complete a rotation movement of said shaft.



3,272,941
OVERLOAD PROTECTED ELECTRIC SWITCH
James F. Sullivan, St. Marys, Pa., assignor to Stackpole Carbon Company, St. Marys, Pa., a corporation of Pennsylvania
Filed Oct. 2, 1964, Ser. No. 401,081
6 Claims. (Cl. 200—116)

1. An overload protected electric switch comprising a housing, a pair of fixed electric contacts inside the housing, one of said contacts being a circuit breaker contact,

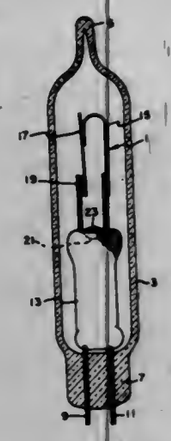


a thermally responsive bimetallic conductor strip secured at one end to the other contact, the strip having a laterally projecting contact end normally hooked onto said breaker contact, said strip being adapted to bend and spring away from the breaker contact when overheated by excessive electric current flowing therethrough, a third fixed contact beside one of said pair of fixed contacts, a movable bridging contact in the housing, a control shaft for moving the movable contact into and out of engagement with said third contact and the fixed contact beside it, a resilient reset strip extending lengthwise of the conductor strip along the side thereof remote from said circuit breaker contact, means in the housing anchoring one end of the reset strip adjacent said other fixed contact, the reset strip being spaced from the other strip while said contact end is hooked onto the breaker contact, and means actuated by the control shaft for bending the reset strip to force its free end toward the adjacent end of the conductor strip when the shaft is operated to open the switch, whereby if the conductor strip has become unhooked from the breaker contact the free end of the reset strip will push said contact end back into hooked-on engagement with the breaker contact.

3,272,942
CONTROL SWITCH FOR AN ELECTRICAL HEATING APPLIANCE
Wilhelm Brandl, 12 Scharbungert, Zurich, Switzerland
Filed Apr. 3, 1964, Ser. No. 357,159
Claims priority, application Switzerland, Apr. 5, 1963, 4,414/63
2 Claims. (Cl. 200—122)

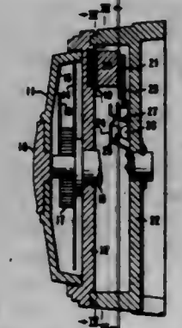
1. A control device for an electric heating apparatus, comprising a hollow body adapted to be evacuated and partly filled with a liquid, an electric heating coil located within said body and serving for the evaporation of the liquid, a resilient member, means connecting said resilient member with said hollow body, whereby said resilient member is elastically deformed in accordance with vapor pressure prevailing in the interior of said hollow body, a switch member, means connecting said switch member with said resilient member, means electrically connecting said switch member with said heating coil, whereby the supply of current to said heating coil is switched on and off according to the degree of deformation of the resilient member, a leaf spring supporting said resilient member, said leaf spring resting on both its ends and having two support points, guide cams located at said two support points and having curved abutment faces for said leaf spring, whereby upon flexure of said leaf spring caused by expansion of said resilient member said guide cams effect a shortening of the effective length of the spring by displacing the support points thereof so that there is a progressive stiffening of the resilient member with increasing pressure in the interior of the hollow body such as to cause the spring characteristic to follow the characteristic of the change of vapor pressure with temperature.

3,272,943
ELECTRIC SHAVER CONTROL ASSEMBLY
Maurice Marie Achille Trouilhet, Lyon, France, assignor to Calor Appareils Electro-Domestiques, Lyon, France, a body corporate of France
Filed Apr. 16, 1964, Ser. No. 360,312
Claims priority, application France, Feb. 6, 1964, 962,922
8 Claims. (Cl. 200—122)



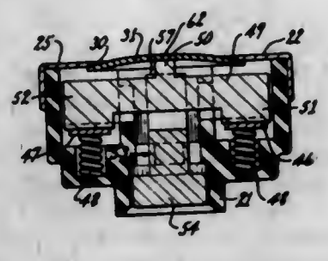
1. A control assembly for a shaver comprising a casing and an electric motor having two identical windings, said control assembly including an electric insulating plate secured to and spaced from one wall of said casing, a first, a second, a third and a fourth electrically conductive strip-like members, secured to the face of said plate facing said casing wall, said members having respective free ends disposed at angularly spaced consecutive locations on a common imaginary circle parallel to said casing wall, said first and second members being respectively connectable to the terminals of a source of electric current, said first member being formed by a bimetal strip carrying at its end opposite to said free end a movable contact engageable with a fixed contact carried by a metal part secured to said insulating plate, said motor windings being respectively connected between said first and said third members and between said second and said fourth members, a voltage-switch button mounted in a hole formed in said casing wall coaxially with said imaginary circle and angularly movable between a first and a second position, the inner face of said button being provided with two sectoral contacts, said sectoral contacts respectively connecting said first to said fourth member and said second to said third member when said button is in said first position and one of said sectoral contacts connecting said third to said fourth member when said button is in said second position.

3,272,944
ENCAPSULATED THERMOSTATIC SWITCH HAVING A HEATER DISPOSED IN THE STEM
William C. Ricker, Waldoboro, and George H. Simpson, Boothbay, Maine, assignors to Sylvania Electric Products Inc., a corporation of Delaware
Filed Nov. 12, 1964, Ser. No. 410,467
2 Claims. (Cl. 200—122)



1. A thermostatic switch comprising: a glass envelope; a stem of insulating material disposed in said envelope, said stem having a cavity formed in the top thereof; a pair of spaced lead-in wires extending through said stem and through an end of said envelope; a bimetal armature secured to one of said lead-in wires; a compensator secured to said armature; an electrical contact secured to

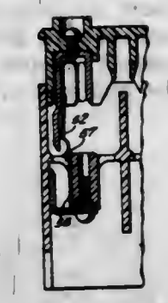
said compensator, said contact being normally closed with respect to the other of said lead-in wires; and a body of



powdered high resistance material disposed in said cavity formed in said stem and bridging said lead-in wires.

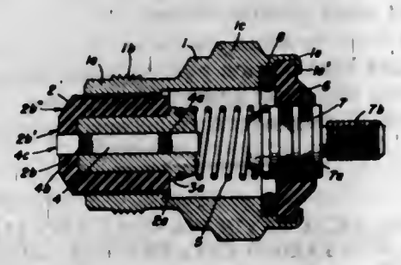
3,272,945
THERMOSTATIC SWITCH EMPLOYING A MATCHING SET OF TEMPERATURE RESPONSIVE MAGNETIC ELEMENTS
William M. Flook, Jr., Wilmington, and Paul A. Vance, Jr., Newark, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed July 29, 1963, Ser. No. 298,299
8 Claims. (Cl. 200—138)

1. A device for controlling the temperature of an environment by controlling the current to a heat transfer plant at said environment which comprises, in combination, a support assembly; a movable member on said support assembly; indicator means on said movable member for selecting a desired temperature of an environment; a series of adjacent temperature responsive magnetic elements mounted upon said movable member, said elements each exhibiting a reversible change in saturation induction at a different discrete transition temperature level, said elements arranged and positioned in a sequential order of graduated transition temperature levels corresponding to said indicator means for selecting a desired temperature of an environment; resilient means movably mounted on said support assembly to and from a rest position; magnetic means mounted on said resilient means, said magnetic means positioned to be attracted to a selected temperature responsive magnetic element when said element is in a magnetic state thereby forcing said resilient means from rest position; and switch means for actuating said heat transfer plant, said switch means located on said support assembly and positioned to operatively engage said resilient means for actuation and deactuation upon movement of said resilient means to and from rest position.



3,272,946
THERMOSTATICALLY CONTROLLED SWITCH MEANS HAVING IMPROVED RESET MEANS THEREFOR
Siegfried E. Manecke, Indiana, Pa., assignor to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware
Filed Apr. 20, 1964, Ser. No. 361,141
8 Claims. (Cl. 200—138)

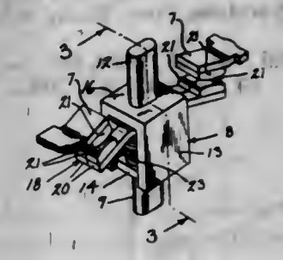
1. In combination a support means, a control member carried by said support means and having at least a portion thereof being movable between two positions relative to said support means, contact means carried by said support means, one of said contact means being movable against and away from the other contact means, said movable contact means having contact closing means normally tending to place said movable contact means into contact with said other contact means, movable actuating means disposed between said control member and said movable contact means and having opposed ends respectively engageable with said control member and said movable contact means whereby said contact closing means places said contact means in electrical contact with each other when said control member is in one of said two positions thereof and whereby said actuating means moves said movable contact means away from said other contact means when said control member is moved to said other position thereof, and movable reset means carried by said support means for resetting said control member from said other position thereof to said one position thereof, said reset means being movable between first and second positions thereof relative to said support means, said reset means having an end engaging said control member when said reset means is moved to said second portion thereof and said control member is in said other position thereof, said reset means when moved to said second position thereof only moving said control member from said other position thereof towards said one position thereof to a reset point insufficient to have said contact closing means move said movable contact means against said other contact means whereby said contact means are not electrically interconnected together unless said control member moves beyond said reset point toward said one position thereof.



3,272,947
SWITCH CONTACT ARRANGEMENT
Herman H. Kobryner, Forest Hills, N.Y., assignor to Murray Manufacturing Corporation, Brooklyn, N.Y., a corporation of New York
Filed May 11, 1964, Ser. No. 366,351
2 Claims. (Cl. 200—163)

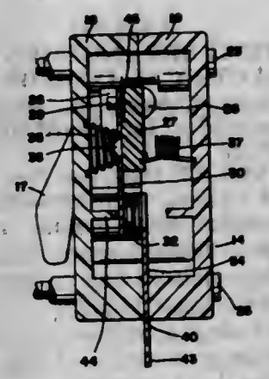
2. A pull-out switch comprising engageable male and female contacts; said male contact comprising physically and electrically parallel primary and auxiliary contact elements, said auxiliary contact element being formed of resilient material and being dimensioned to be of lesser cross-section and of greater relative length than said primary contact for making first with said female contact and breaking last, absorbing any arc in a greater resistance path; a puller and a tub; means for mounting the male contact in said puller; means for mounting the female contact in said tub at a location to permit engagement of said male and female contacts upon the seating of said puller in said tub; said male auxiliary contact element including a projecting portion at the end thereof, and a non-conducting lip in said tub adjacent the end of

the female contact element and disposed relative thereto to contact first the projecting end of the male auxiliary contact element and require additional force to seat and unseat said puller immediately before make and break, respectively, of said male and female contacts.



3,272,948
ELECTRIC SWITCH STRUCTURE
Stanley J. Gloviak, Westchester, and Roger A. Weller, Skokie, Ill., assignors to Carter Precision Electric Co., Skokie, Ill., a corporation of Illinois
Filed June 3, 1964, Ser. No. 372,276
7 Claims. (Cl. 200—166)

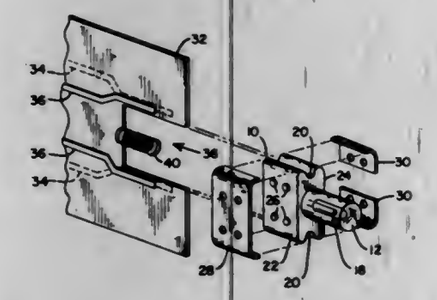
6. An electric switch structure comprising a tubular metallic shell having an open end portion, insulating means closing the other end portion of said shell, a plunger mounted for reciprocating movement within said open end portion and comprising an insulating member having free sliding movement with the inner wall of said open-end shell portion, said insulating member having an end portion extending outside of said open-end portion and having a central aperture formed therein, a metallic contact pin mounted within said shell and having one end thereof extending through the aperture in said insulating member, a holder for said pin formed separately from said insulating member and frictionally holding said pin for longitudinally adjusting said pin with respect to said insulating member, and spring means mounted within said shell and acting on said pin holder to resiliently bias said holder into a position where an end portion of said pin extends through said aperture.



3,272,949
BIFURCATED PARALLEL CONTACTS FOR RELAY
Leland E. Lawrence, Wauwatosa, Wis., assignor to Allen-Bradley Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Aug. 14, 1964, Ser. No. 390,271
6 Claims. (Cl. 200—166)

6. In a contact assembly the combination comprising:
a supporting structure;
a pair of stationary contacts spaced from one another and mounted upon said supporting structure to form an electrical pole for the assembly;
a contact actuator movable in a path of action substantially normal to a line between said spaced stationary contacts which is guided in such movement by said supporting structure, said contact actuator including a contact receiving cage with a seat having surfaces oblique to said line between said spaced stationary contacts;
means associated with said supporting structure for reciprocating said contact actuator in said path of action;

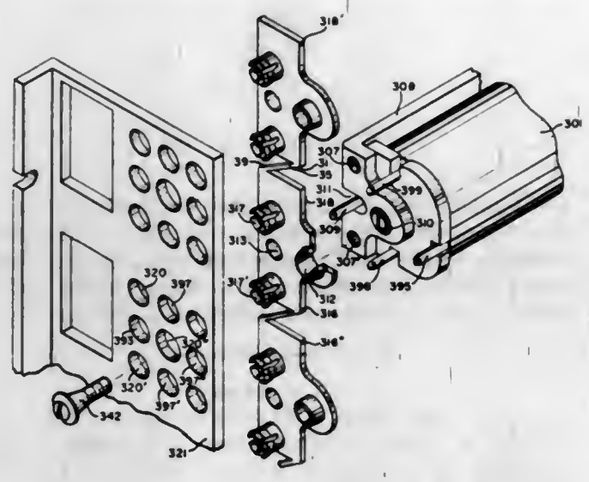
a pair of movable contacts formed of two separate pieces mounted in said contact receiving cage for bridging engagement between said stationary contacts, said movable contacts lying in closely adjacent side by side relation within said cage and forming parallel electrical paths between said stationary contacts when in engagement therewith, each of said movable contacts having a saddle engageable with said oblique surfaces of said seat to preclude endwise shift of said movable contacts when said seat and saddles are in engagement;
said contact receiving cage having side walls between which said movable contacts are closely held to preclude any substantial sidewise shift of said movable contacts; and
a common bias spring means working against said pair of movable contacts.



3,272,950
CONSTANT-LOAD SPRING-LOADED ELECTRICAL SWITCH
Joseph Greenblut, University Heights, Ohio (3333 Warrensville Center Road, Shaker Heights, Ohio 44122)
Filed Sept. 28, 1964, Ser. No. 399,536
9 Claims. (Cl. 200—166)

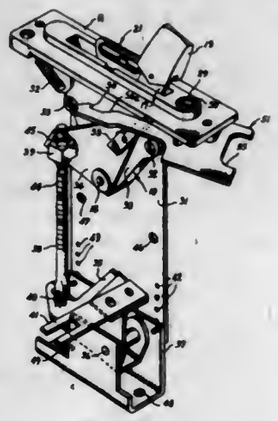
1. In an electrical switch, the combination of contact elements mounted for relative movement into and out of circuit-closing relationship, first spring means bearing upon and urging one of said contact elements toward circuit-closing position, second spring means bearing upon and urging said one contact element toward circuit-opening position in opposition to said first spring means, one

of said spring means exerting a force upon said one contact element less than one-half the force exerted by the other of said spring means, and movable switch-operating means operatively interposed between said first and second spring means for selectively disengaging said spring means from opposition to each other.



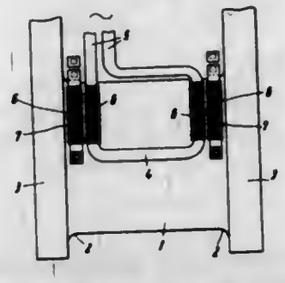
3,272,951
SWITCH INDICATOR DEVICE FOR PRINTED CIRCUIT
Harold G. O'Brien, Minneapolis, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Nov. 25, 1964, Ser. No. 413,724
14 Claims. (Cl. 200—167)

1. A switch-indicator assembly comprising in combination:
(a) an actuator assembly consisting of an insulation block mounting an indicator light means;
(b) a switch shorting bar means mounted on one side of said actuator assembly;
(c) indicator electrode means mounted on an opposite side of said actuator assembly;
(d) a printed circuit board containing printed circuit means and containing a notch adapted to receive said actuator assembly in a sliding manner;
(e) a panel member having secured to one face thereof an edge of said printed circuit board;
(f) and a biasing means secured to one end of said notch for urging said actuator assembly in a direction toward said panel face whereby the application of a force in opposition to the bias effects an electrical function through a circuit including the printed circuit means.



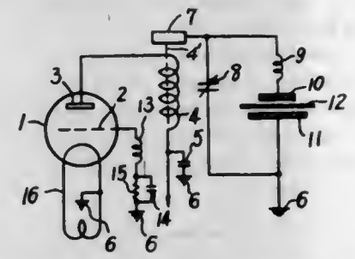
3,272,952
MOUNTING ARRANGEMENT FOR AN ELECTRICAL COMPONENT
Patrick E. McKeon, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Northlake, Ill., a corporation of Delaware
Filed Mar. 17, 1965, Ser. No. 440,491
5 Claims. (Cl. 200—168)

1. An arrangement for mounting an electrical component in insulated fashion comprising, in combination:
(1) a mounting plate having an aperture of predetermined diameter therethrough,
(2) a screw having a washer-type head portion with a diameter larger than that of said aperture, a shank and therebetween a portion tapering in the direction from said head towards said shank,
(3) and an insert of insulating material comprising:
a base portion and extending therefrom and integrally formed therewith a resilient collar portion having a flange at its free end, a hole being formed through said insert, which is surrounded by said collar portion, said flange having an outside diameter slightly larger than that of said aperture,
said collar portion with its flange being inserted into said aperture from said component side of said mounting plate, said flange emerging from the other side of said mounting plate and overlapping the edges of said aperture so as to retain said insert on said mounting plate,
said flanged end of said collar portion receiving said shank which in turn passes through said collar portion into said component, said flange,



upon the tightening of said screw, being engaged and deformed by said tapered screw portion and said head portion, thereby forming an insulating layer between said head and said plate,
and said base portion portion being interposed between said plate and said component to provide an insulating layer therebetween.

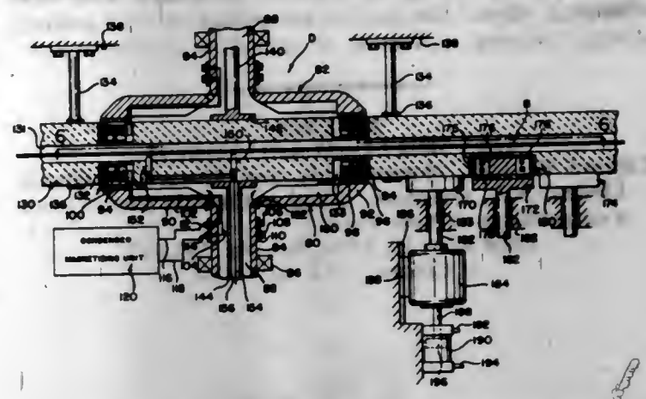
3,272,953
EXTERNAL ACTUATOR HANDLE MECHANISM FOR ENCLOSED CIRCUIT BREAKER
Robert S. Tillson, Bristol, Conn., assignor to General Electric Company, a corporation of New York
Filed Feb. 8, 1965, Ser. No. 430,801
14 Claims. (Cl. 200—172)



1. A handle mechanism comprising: an escutcheon having an elongate slot therein; a body portion integral with said escutcheon and extending in a planar axis in general alignment with said slot; handle pivot means carried by said integral body portion; a handle extending through said slot and supported by said handle pivot means for selective reciprocal positioning; and means engaged with said handle pivot means adjacent said body portion for reciprocal movement responsive to the positioning of said handle, said means being adapted to engage and reciprocally operate separate switch means.

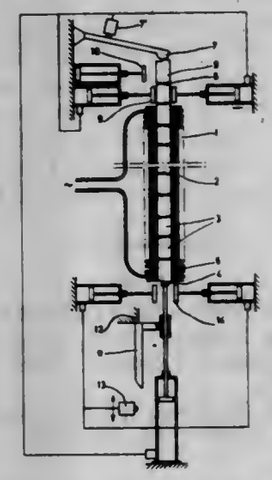
3,272,954
METHOD OF HEATING BY INDUCTION
Gerhard Seulen, Remscheid, and Hermann Kuhlbars, Wuppertal-Elberfeld, Germany, assignors to Deutsche Edelstahlwerke Aktiengesellschaft, Krefeld, Germany, and Allgemeine Elektricitats-Gesellschaft, Berlin-Grunewald, Germany
Filed Sept. 25, 1964, Ser. No. 399,303
Claims priority, application Germany, Sept. 25, 1963, D 42,556
3 Claims. (Cl. 219—10.43)

1. A method of inductively heating a workpiece by means of at least two inductors, in which the said inductors have the form of heating conductor loops which provide substantially closed paths for the current over the workpiece surface, and while air coupling between the inductors is substantially suppressed the said inductors act simultaneously on different areas of the work surface while energised by current sources having different characteristics, frequencies and outputs.



3,272,955
METHOD OF COUPLING HIGH FREQUENCY ELECTRIC CIRCUIT
Sakuji Yamaguchi, 12 1-chome, Enjo-cho, Showa-ku, Nagoya, Japan
Filed Feb. 7, 1964, Ser. No. 343,259
Claims priority, application Japan, Feb. 13, 1963, 38/6,942
2 Claims. (Cl. 219—10.53)

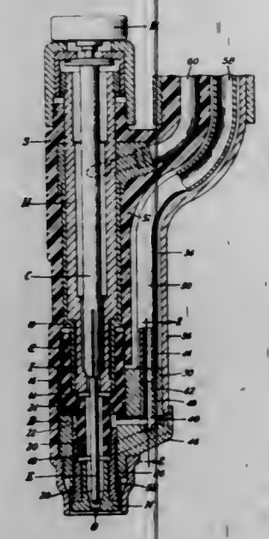
1. A circuit for coupling a high frequency oscillatory circuit to a load circuit which comprises a flat metal plate located on and transverse to the axial line of a tank coil of said oscillatory circuit and in spaced relation thereto, and a connection between said metal plate and the load circuit which includes a paralleled circuit combination of a variable tuning capacitor and a load impedance.



3,272,956
MAGNETIC HEATING AND SUPPORTING DEVICE FOR MOVING ELONGATED METAL ARTICLES
Max Baermann, Bensberg Wulfshof, Cologne (Rhine), Germany
Filed Mar. 26, 1964, Ser. No. 354,861
Claims priority, application Germany, Apr. 1, 1963, B 71,367
24 Claims. (Cl. 219—10.61)

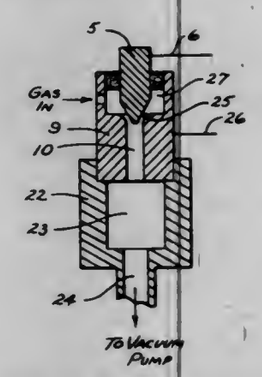
1. A device for heating an electrically conductive strip traveling in a given path comprising vertically spaced first and second rotors, means for rotating said rotors about an axis generally perpendicular to said strip with the rotors being on opposite sides of said strip, one of said rotors having a plurality of circumferentially spaced, alternate north and south magnetic poles, means for synchronizing the speed of said rotors and flux directing

means for causing the flux from the poles on said one rotor to extend to the other rotor and generally perpendicularly through said strip.



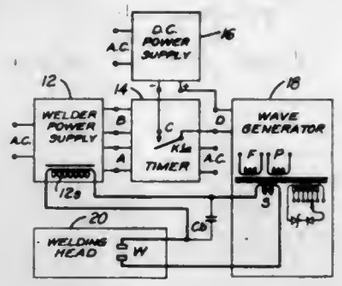
3,272,957
APPARATUS FOR FEEDING AND EXTRACTING A WORK-PIECE FROM A COLUMN OF WORK-PIECES OF VARYING LENGTHS
Heinz Koesling, Notzingen, and Robert Brauneisen, Oberboihingen, Germany, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Dec. 14, 1964, Ser. No. 417,948
Claims priority, application Germany, Dec. 13, 1963, P 33,187
2 Claims. (Cl. 219—10.69)

1. The combination with a vertically positioned oven having an exit at one end and an entrance at the other end and apparatus for feeding and extracting one work-piece at a time from a column of work-pieces of varying length within said oven comprising, a slide member for raising and lowering said column in a vertical direction, means for moving said slide member, column elevation determining means positioned relative to the exit end of said oven for engaging a work-piece externally of said exit end and terminating movement of said slide member, means operatively connecting said elevation determining means and said means for moving said slide member, a follower member frictionally coupled with said slide member, stop means for engaging said follower member in the raising direction of movement of said slide member whereby said slide moving relative to said follower when said follower is engaged with said stop means, clamping means positioned relative to the entrance end of said oven for engaging a work-piece externally of said other end upon lowering movement of



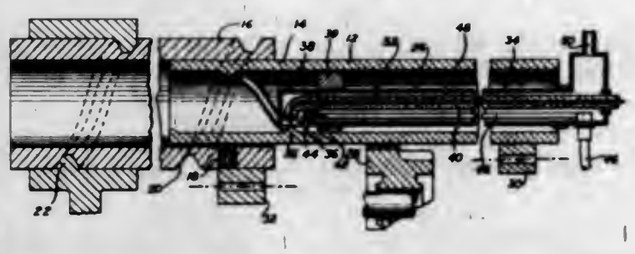
said slide member and adjustable means in the path of lowering movement of said follower member, said adjustable means being operatively associated with said clamping means for halting movement of said column during lowering movement of said slide member.

3,272,958
GAS SHIELDED ARC TORCH
Clifford W. Hill, Mountainside, and Edward A. Obuch, Linden, N.J., assignors to Union Carbide Corporation, a corporation of New York
Filed Mar. 18, 1964, Ser. No. 352,927
8 Claims. (Cl. 219—75)



1. In an arc torch, a barrel comprising a metal front body having an annular fluid chamber therein concentric with said barrel, said front body having a lateral extension eccentric to said barrel with a passage therein leading to said annular fluid chamber with an inlet therefor in the rear thereof, and a metal supply tube brazed to said inlet and extending rearwardly therefrom parallel and eccentric to said barrel.

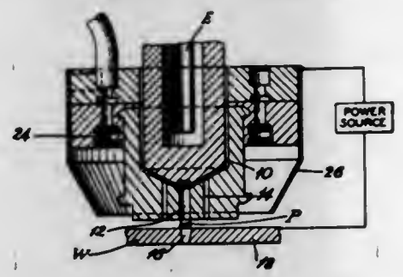
3,272,959
ELECTRIC ARC TORCHES
James A. Browning, Hanover, N.H., assignor to Thermal Dynamics Corporation, Lebanon, N.H., a corporation of New Hampshire
Filed Feb. 24, 1965, Ser. No. 434,779
6 Claims. (Cl. 219—75)



1. In an electric arc torch having an arc gap, the method of initiating an arc in said torch comprising applying a voltage across said gap, said voltage being below the breakdown value required to bridge said gap at substantially one atmosphere; and reducing the fluid pressure in the region of said gap until an arc is struck across said gap.

3,272,960
WELDING APPARATUS AND METHOD
Melvin H. Smith, Perris, Calif., assignor to Bourns, Inc., a corporation of California
Filed Mar. 4, 1965, Ser. No. 437,213
9 Claims. (Cl. 219—91)

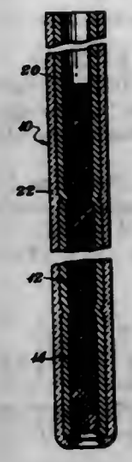
1. A method of electrically welding a fine-gauge insulated conductive wire to a base conductor without separate stripping of insulation from the wire, said method comprising as steps:
bringing the insulated wire and base conductor into longitudinal juxtaposition in a path between a set of welding electrodes with insulation on the wire separating the wire from the base conductor and from one of the electrodes and advancing at least one of the electrodes toward the other with said wire and base therebetween to press the insulation on said wire firmly against said base conductor and against one of said electrodes;
applying across the electrodes a high-voltage high-frequency A.C. potential sufficient to cause ionization of material and degradation of insulation along the said path between the electrodes;
thereafter during continued ionization of material along said path, applying force tending to close said electrodes and concurrently passing a first pulse of direct current between the electrodes along said path, whereby to sufficiently degrade the insulation that the electrodes bring the wire into metallic contact with the base conductor, and
thereafter passing a second pulse of current between the electrodes and through the contacting wire and base conductor in said path whereby the melt portions of the wire and conductor and cause fusion-union thereof in said path.



3,272,961
METHOD FOR MAKING RIBBED VAPOR GENERATING TUBES
Leo A. Maier, Jr., Dansville, N.Y., and Robert A. Lorenzini, Westport, Conn., assignors to Foster Wheeler Corporation, New York, N.Y., a corporation of New York
Filed Nov. 5, 1964, Ser. No. 409,197
2 Claims. (Cl. 219—125)

1. A method for forming a turbulator weld bead of predetermined configuration on the inside of an elongated tube wherein longitudinally aligned points of successive

crests of the weld bead are a substantial distance apart comprising the steps of
positioning and centering a welding torch nozzle within the tube so that a free end thereof is disposed at one end of the tube;
feeding an electrode wire within the torch at a predetermined rate of speed, the wire passing through said free end;
rotating the tube at a predetermined rate of rotation;
withdrawing the welding torch and electrode wire from the tube at a speed independent of the speed of rotation of the tube but programmed with the speed of rotation to give the desired weld bead configuration;
the welding torch changing the electrode wire position along the tube from one axial with respect to the tube to one normal to the surface of the tube; and
supplying a welding current to the electrode wire.



3,272,962
ELECTRIC ARC WORKING PROCESS
Leonard Mauskapf, Wilkes-Barre, Pa., assignor to Union Carbide Corporation, a corporation of New York
Filed May 3, 1965, Ser. No. 452,697
3 Claims. (Cl. 219—137)

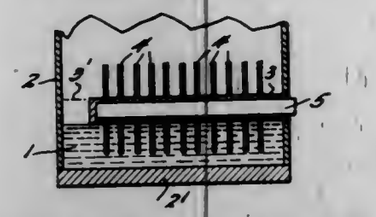
1. An electric arc welding process with an arc torch device including an electrode and a nozzle having a constricting arc passageway in substantial axial alignment with, but spaced from, said electrode to thereby provide a chamber between said electrode and the mouth of said arc passageway and having gas ports communicating with said chamber which comprises establishing an arc between said electrode and workpiece; introducing a gas into said arc torch and into said chamber, passing said arc and at least some of said gas through said constricting arc passageway to direct an arc plasma effluent upon said workpiece, directing the remainder of said gas through said gas ports in discrete streams on substantially diametrically opposite sides of said arc plasma along and outside of, but not surrounding, said arc plasma effluent to thereby elongate the arc plasma effluent.

3,272,963
FLUX-COATED CARBIDE WELDING ROD
Rene D. Wasserman, Cummings Point, Stamford, Conn., and Joseph F. Quaas, Island Park, N.Y., assignors to Eutectic Welding Alloys Corporation, Flushing, N.Y., a corporation of New York
Filed Mar. 21, 1962, Ser. No. 181,304
4 Claims. (Cl. 219—146)

1. A welding rod for depositing a refractory carbide-laden surface layer upon a parent metal comprising an elongated compressed and sintered mass of fine carbide particles, a metallic binder cementing said mass of fine carbide particles together, an elongated relatively strong metal member supporting said carbide mass, attaching means securing said carbide mass and supporting member together to permit said supporting member to protect said carbide mass from breaking, the metal composition of said supporting member being capable of fusion with said fine carbide particles and said parent metal, a flux coating upon said welding rod consisting essentially of the following constituents in the indicated ranges of percents by weight which are attached to said rod by a suitable binder:

Constituent:	Percent by weight
Active metal fluorides	5–35
Alkaline earth metal carbonates	20–70
Carbon	2–35
Metallic powders	5–60
Chromium oxide	1–5

3,272,964
FABRIC STEAMER
J. Paul Carlos, 6 Driver Lane, and Charles W. Gamble, 5914 S. Datura, both of Littleton, Colo.
Filed June 15, 1964, Ser. No. 375,228
9 Claims. (Cl. 219—271)



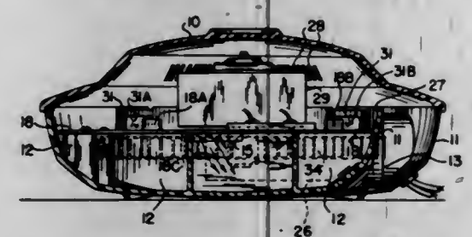
1. A portable fabric steamer comprising a housing, an enclosed reservoir within the housing for containing a column of water having an air column portion for assisting flow of the water through a bottom opening in the reservoir by gravity flow, a passage extending from the bottom opening of the reservoir to a point of discharge in a wall of the housing for converting water to steam, at least one layer of heat insulation between the passage and the adjoining housing surfaces and between the passage and the reservoir, an orifice between the opening of the reservoir and the passage for controlling the flow of water from the reservoir to the passage, heating means disposed adjacent and in heat exchange relation with the passage for heating the passage, a manifold member disposed on the housing having a fluid conductive portion inclusive of an input branch extending from the insulated passage and plural output branches having outlets at in-

tervals along a plane transverse to the insulated passage to disperse the steam released from the passage, and a nozzle portion enclosing the output branches adapted to direct the steam discharge in a spreading pattern to a surface area of a fabric over which the steamer is moved.

3,272,965
VACUUM DIFFUSION PUMP

Walter Reichelt, Hanau, Germany, assignor to W. C. Heraeus G.m.b.H., Hanau am Main, Germany, a corporation of Germany

Filed June 1, 1964, Ser. No. 371,564
Claims priority, application Germany, June 14, 1963, H 49,451
5 Claims. (Cl. 219—275)

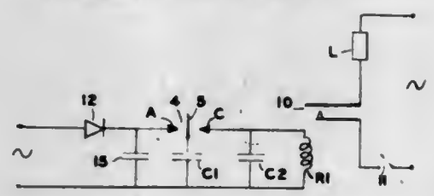


1. In a vacuum diffusion pump having a vertical cylindrical housing and a bottom wall secured to the lower end thereof and defining therewith a nozzle assembly for expanding and accelerating oil vapor, an oil charge disposed in the lower end of said housing, a plurality of horizontally disposed cylindrical tubes secured within said housing above the upper surface of said oil charge, said tubes being each provided with an open end which is disposed exteriorly of said housing, an electric heating element disposed within each of said tubes for continuously generating oil vapor from said oil charge, each of said tubes having a plurality of longitudinally spaced parallel heat conductive plates secured thereto perpendicular to the axis thereof, the lower parts of said plates being immersed into said oil charge for heating and vaporizing said oil, and the upper parts of said plates extending above the liquid oil charge to further heat the vapor which rises vertically after being formed and which passes between the upper parts of said plates, said further heating by the upper parts of said plates accelerating the flow of vapor formed from said oil charge.

3,272,966
DEVICE FOR DRYING HAIR AND FINGERNAILS

Earl E. Sutton, Mansfield, Ohio, assignor to Dominion Electric Corporation, a corporation of Ohio

Filed June 20, 1963, Ser. No. 289,363
3 Claims. (Cl. 219—370)

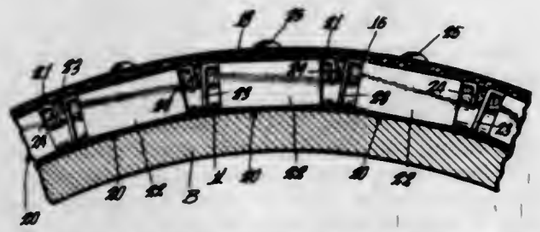


1. A drying device for hair and fingernails comprising the combination of a lower shell, an upper shell joined to the lower shell to form a hollow enclosure, a supporting plate carried by the lower shell and positioned to divide the enclosure into upper and lower sections, an electric motor carried by the plate and extending into the upper section, a rotary fan carried by the plate and extending into the lower section, said lower shell having an outlet adapted to engage an air hose for conduction of air therefrom for the drying of hair, said upper shell having inlet means for the ingress of air into the enclosure, said plate having a central opening to permit air from said inlet means to be drawn by the rotary fan through said central opening into the lower section of the enclosure, said lower shell having a convolute confining wall cooperating with said rotary fan for the driving of air drawn into said lower section to said outlet, an electric resistance heating element carried by said plate and extending into the lower section adjacent said outlet for heating air driven by the rotary fan prior to its egress from said outlet, a compartment in the enclosure formed by cooperating portions of said shells and plate at a location adjacent the periphery of the joined shells, said compartment having an opening into the lower section for the leaking of driven air in the lower section into said compartment before reaching said outlet, said compartment having an exit for the egress of said driven air exteriorly of said joined shells for the drying of fingernails, said joined shells at said exit having portions forming a slideway, and a closure slidable in said slideway for closing and opening said exit as desired.

3,272,967
LAMP CONTROL MEANS

Marvin I. Mindell, Great Neck, N.Y., assignor to Viewlex, Inc., Holbrook, N.Y.

Filed May 4, 1965, Ser. No. 453,045
4 Claims. (Cl. 219—471)

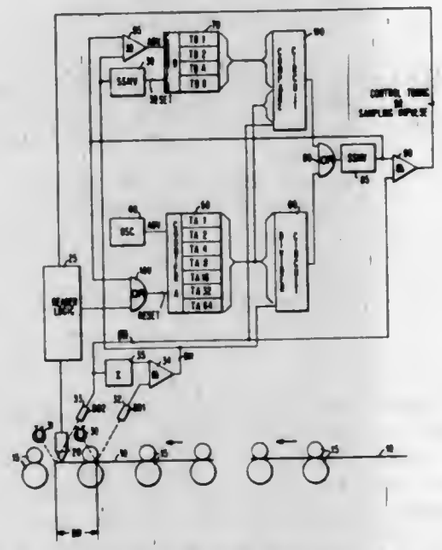


1. In apparatus having a heat lamp of the type directing heat onto papers passed between two rollers,
means to apply voltage to said lamp only while said rollers are rotating comprising:
a solenoid,
a lamp switch connected in series with said lamp and a source of power,
said switch being normally open but being adapted to be closed by said solenoid,
means to apply voltage across said solenoid for a time slightly greater than one rotation of said rollers, and
means operated by said rollers to reactivate said voltage applying means once each cycle of said rollers.

3,272,968
FLEXIBLE ELECTRIC SURFACE HEATING ASSEMBLY

John F. Volker, Pittsburgh, Pa., assignor to Edwin L. Wiegand Company, Pittsburgh, Pa.

Filed Dec. 5, 1963, Ser. No. 328,294
8 Claims. (Cl. 219—535)

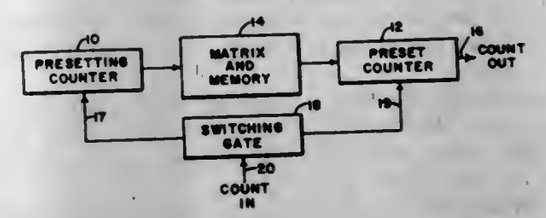


1. A body heater assembly to be applied to body surfaces which may be non-planar, comprising an elongated, longitudinally flexible, heat-resistant support member, an elongated, tubular, longitudinally flexible, metallic sheathed, electric resistance heating element generally coextensive with said support member, said element being disposed adjacent to but spaced laterally of said support member and being positioned intermediate the latter and the body to be heated, and a plurality of sheet-metal spacer members in end-to-end relation intermediate said support member and said element for maintaining the spaced relationship therebetween, each spacer member being channel-shaped in cross-section with its web portion disposed adjacent to and parallel with said support member and with other portions projecting transversely of said support member toward said element for engagement with longitudinally spaced element portions.

3,272,969
DIGITAL PULSE GENERATOR WITH COMPENSATION FOR DOCUMENT VELOCITY VARIATIONS

Alfred Cutaia, Rochester, Minn., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 6, 1963, Ser. No. 328,678
10 Claims. (Cl. 235—61.11)

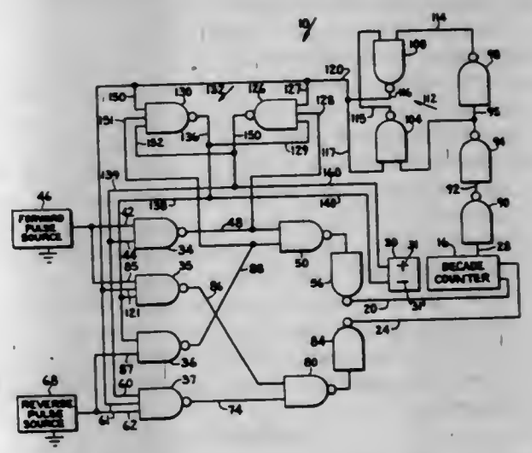


3. In a document reading machine, the combination comprising:
a first document detector positioned at a predetermined distance downstream of the read station in the document path of said document reading machine and operable to generate a signal upon detecting the presence of a document,
a second document detector positioned at a predetermined distance upstream of the read station and operable to generate a signal upon detecting the presence of a document,
logic circuit means connected to said first and second document detectors and operable to generate an output signal only when said first document detector alone is detecting the presence of a document,
an oscillator,
a first counter connected to said oscillator to be advanced thereby,
a frequency divider circuit connected to said logic circuit means to be rendered operable thereby, and connected to said first counter to provide an output signal every time said first counter reaches a predetermined value, the output of said frequency divider circuit being connected to said first counter to reset the same with said output signal,
a second counter connected to said logic circuit means to be rendered operable thereby and connected to said frequency divider circuit to be advanced by the output signal therefrom,
comparing means connected to said second document detector to be rendered operable during the period a signal is generated by said second document detector and connected to said first and second counters to generate an output signal upon the values in said counters being equal, the output of said comparing means being connected to said first counter to reset the same to enable successive comparisons to be made between said first and second counters.

3,272,970
AUTOMATIC PRESET COUNTERS

John F. Laycak, Duquesne, and Walter A. Wilson, Pittsburgh, Pa., assignors to Jones & Laughlin Steel Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

Filed Aug. 21, 1962, Ser. No. 218,418
16 Claims. (Cl. 235—92)



1. Pulse counting apparatus comprising a first counter, means for feeding input pulses to said first counter, a second counter, means for selectively stopping the feed of input pulses to said first counter and for starting the feed of input pulses to the second counter, and means electrically connected to said first and second counters for presetting the second counter to count the number of pulses counted by the first counter prior to stoppage of the feed of input pulses thereto.

3,272,971
ELECTRONIC COUNT ACCUMULATOR

James J. Klinikowski, Somerville, N.J., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan

Filed Feb. 5, 1963, Ser. No. 256,384
1 Claim. (Cl. 235—92)

A count accumulating circuit, in which all gates are NAND gates, comprising:
a first gate having two inputs and an output,
a second gate having three inputs and one output,
a source of forward count pulses coupled to one input of each of said first and second gates,
a third gate having two inputs and one output,
a fourth gate having three inputs and one output,
a source of reverse count pulses coupled to one input of each of said third and fourth gates,
a fifth gate having two inputs and an output,

a sixth gate having one input and one output and having its input coupled to the output of said fifth gate, the output of said first gate being coupled to an input of said fifth gate,

a seventh gate having two inputs and one output, the output of said fourth gate being coupled to an input of said seventh gate,

an eighth gate having one input and one output and having its input coupled to the output of said seventh gate,

the output of said third gate being coupled to one input of said fifth gate,

the output of said second gate being coupled to one input of said seventh gate,

a reversible decade counter having a forward count input line and a reverse count input line and an output, the forward count input line being coupled to the output of said sixth gate, the reverse count input line being coupled to the output of said eighth gate,

a control flip-flop comprising ninth and tenth gates each having three inputs and one output, the output of each of said flip-flop gates being coupled to one input of the other,

the output of said third gate being coupled also to one input of said ninth gate,

the output of said first gate also being coupled to an input of said tenth gate,

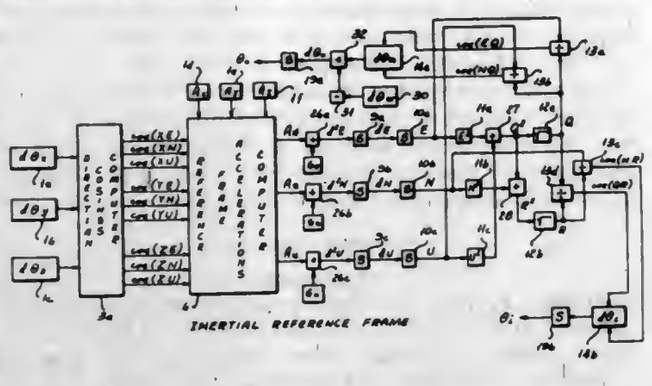
the output of said ninth flip-flop gate also being coupled to one input of each of said second and third gates and to a minus sign indicator,

the output of said tenth gate also being coupled to one input of each of said first and fourth gates and to a plus sign indicator,

the output of said decade counter being coupled to the single input of an eleventh gate, the output of which is coupled to the single input of a twelfth gate,

the output of said twelfth gate being coupled to the single input of a thirteenth gate which has one output,

the output of said twelfth gate also being coupled to an input of a fourteenth gate, the output of which is coupled to an input of a fifteenth gate,



the output of the thirteenth gate being coupled to a second input of the fifteenth gate,

the output of the fifteenth gate being coupled both to an input of the fourteenth gate and to an input of each of said ninth and tenth flip-flop gates and to an input of said second and fourth gates,

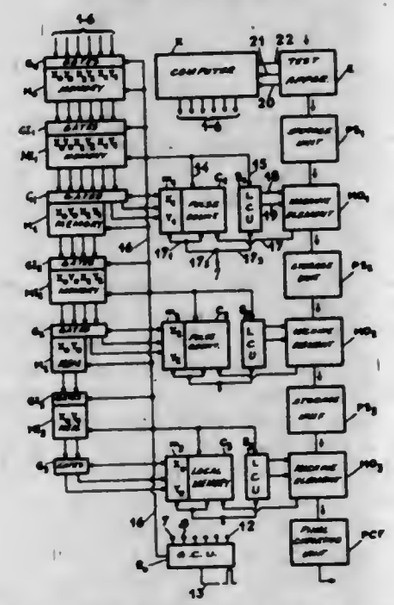
the states of said ninth and tenth flip-flops gates being determined by the polarity of the count in the decade counter, said flip-flop gates controlling the operation of said plus and minus signs and further controlling the states of said first, second, third, and fourth gates and the path into the forward or reverse counting lines of the decade counter whereby the correct count sign is operated and counting pulses are automatically applied to the decade counter in the proper direction.

3,272,972
RANDOM ORIENTATION INERTIAL SYSTEM
Joseph Yamron, West Hartford, and Andrew E. Scoville, Ellington, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Jan. 15, 1962, Ser. No. 164,649
12 Claims. (Cl. 235—150.25)

1. A random orientation inertial system including in combination an inertial measurements unit comprising a plurality of gyroscopes and a plurality of accelerometers. means responsive to the gyroscopes for computing direction cosines defining the orientation of the measurements unit relative to an earth-fixed reference frame, means responsive to the direction cosines and to the accelerometers for determining accelerations in the reference

frame, means providing the rate of rotation of the earth, and means coupling the earth rate means to said direction cosines computing means.

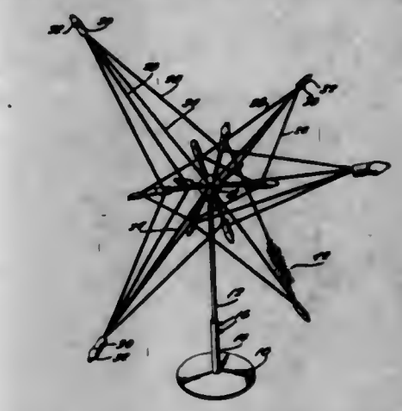
3,272,973
UNIVERSAL TURBULENCE INDICATOR
Paul B. MacCready, Jr., Pasadena, Calif., assignor to Meteorology Research, Inc., Altadena, Calif., a corporation of California
Filed Aug. 27, 1962, Ser. No. 219,643
6 Claims. (Cl. 235—151.3)



1. Apparatus for measuring air turbulence comprising an airspeed sensor, electrical signal generator means connected to said airspeed sensor for generating an electrical signal which is a function of the two-thirds power of the airspeed sensed, signal filter means having an input and an output and operable to pass a band of frequencies corresponding to frequencies less than a frequency of two hundred meters divided by the airspeed sensed, means for applying the electrical signal from the signal filter means to the filter input, and indicator means connected to the output of the filter means and operable in response to the electrical signal output of the filter means to provide an indication which is a function of the electrical signal output of the signal means.

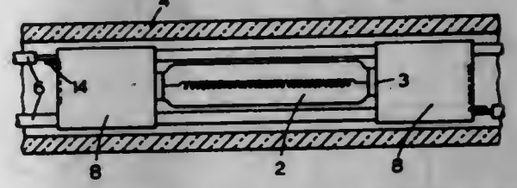
3,272,974
UNIVERSAL TURBULENCE INDICATOR
Paul B. MacCready, Jr., Pasadena, Calif., assignor to Meteorology Research, Inc., Altadena, Calif., a corporation of California
Filed Apr. 8, 1963, Ser. No. 271,408
8 Claims. (Cl. 235—151.3)

1. Apparatus for measuring fluid turbulence comprising a fluid velocity sensor, electrical signal generator means connected to said fluid velocity sensor for generating an electrical signal which is a predetermined function of the fluid velocity sensed, signal filter means having an input and an output and operable to pass a band of frequencies corresponding to wavelengths within a five-thirds spectral power range of fluid turbulence, and indicator means connected to the output of the filter means and operable in response to the electrical signal output of the filter means to provide an indication which is a function of the electrical signal output of the signal means.



3,272,975
AUTOMATIC MACHINE-TOOL CONTROL SYSTEM FOR TRUING MECHANICAL PARTS
Joseph Czech, Paris, France, assignor to Compagnie Generale d'Automatisme, Paris, France
Filed Oct. 23, 1962, Ser. No. 232,354
Claims priority, application France, Oct. 27, 1961, 877,231
22 Claims. (Cl. 235—151.11)

1. In an automatic machine for balancing mechanical parts with respect to a given rotation axis by removing material from predetermined portions of said parts, an electric control system comprising test means for translating the unbalance of said parts into a plurality of electric voltages, electric circuit means for deriving from said voltages analogue voltages, the amplitude of each one of which is proportional to the quantity of material to be removed from one corresponding of said predetermined portions, coding means for translating each said amplitude into a group of coded digital data representing a binary number according to a predetermined non-linear relationship between said amplitude and number, means for storing said group of coded digital data and means for causing said stored group of coded digital data to control the infeed of at least one corresponding tool proportionally to said binary number into one of said portions, wherein said coding means comprise servomechanism means for controlling the displacement of a first movable member with respect to a reference position, a coder including a second movable member, the position of which controls a plurality of electric currents each having one or the other of two possible intensity values, said currents constituting said group of coded digital data, and a mechanical linkage between said first and second movable members so arranged as to ensure said predetermined non-linear relationship between the respective displacements of said members.

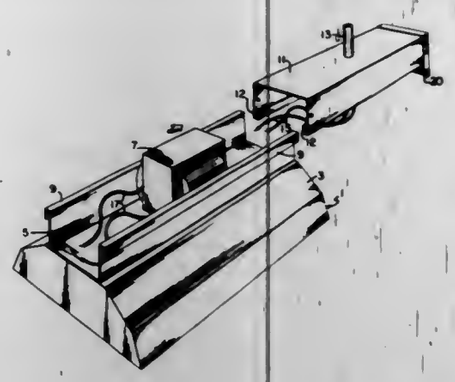


3,272,976
STAR SHAPED ORNAMENT
Michael Charchan and William Charchan both of N. Grove St. Road, Standish, Mich.
Filed July 12, 1963, Ser. No. 294,541
3 Claims. (Cl. 240—10)

1. A star shaped ornament comprising a standard, a plurality of elongated support members projecting outwardly from the upper end of said standard, said members being in two groups with the first group lying in a plane perpendicular to the plane of the second group, there being four members in each group, a plurality of rods projecting outwardly from the free end of each

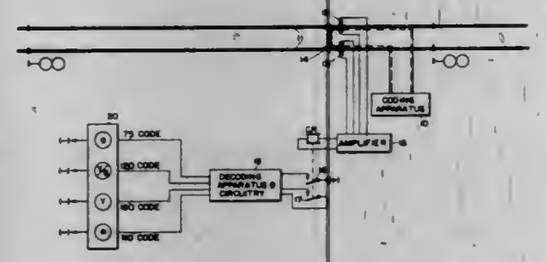
of said members, the four rods from the four adjacent members on each side of said standard converging together at their free ends in a connecting element to form a single point of a six-pointed star, said connecting element including a socket for an electric light bulb.

3,272,977
LIGHT SOURCES
John W. Holmes, 45 Bodmin Road, St. Austell, Cornwall, England
Filed Apr. 17, 1964, Ser. No. 360,637
12 Claims. (Cl. 240—11.2)



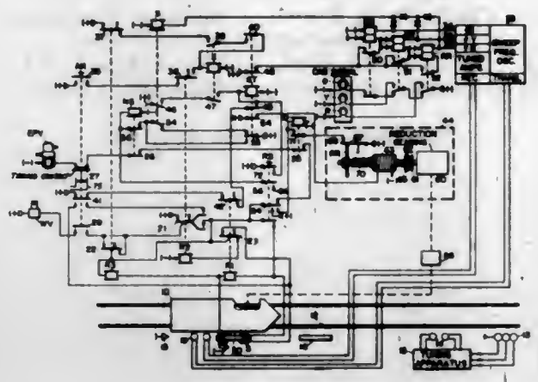
2. A light source comprising a hollow waterproof tube of flexible transparent plastic material housing a series of lamps spaced apart and slidable within and along the length of the tube, the said lamps being electrically connected together by conductors extending inwardly from part of an electrical coupling positioned at each end of the tube and mechanically connected together by at least one tension member, means for keeping the tension member in tension, the said means for keeping the tension member in tension being in the form of an anchorage to which the tension member is connected at one end of the tube and a tension spring connected to the tension member at the other end of the tube, the said conductors being a pair of insulated conductors which extend along the length of the tube and act also as tension members, each lamp extending between a pair of lamp carriers and each conductor being electrically associated with and mechanically connected to one carrier of each pair, each pair of carriers including spring contacts which together exert an axial load on the lamp, and the reaction force exerted on the carriers being taken up by the conductors extending between them.

3,272,978
LIGHTING FIXTURE
Donald L. Jackson, Moundsville, W. Va., assignor to Sylvania Electric Products Inc., a corporation of Delaware
Filed Dec. 24, 1963, Ser. No. 333,024
2 Claims. (Cl. 240—78)



1. A lighting fixture assembly comprising: a reflector; an open-ended trough mounted on the top of said reflector, the upper longitudinal edges of said trough defining

channels; a ballast mounted in said trough, said ballast having wiring connected thereto and extending therefrom; and an open-ended canopy, the lower longitudinal edges of which define channels, said first mentioned channels

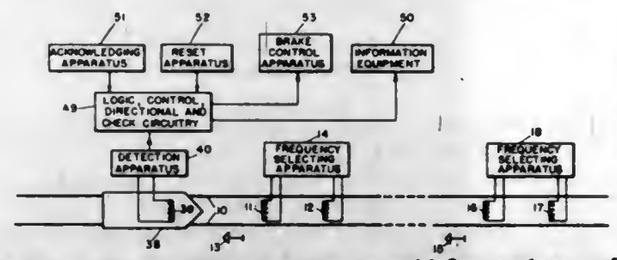


and said second mentioned channels being disposed in interlocking relationship to support said trough from said canopy, and said open-ended trough and said open-ended canopy defining an accessible chamber within which wiring connections may be effected.

3,272,979
DECODING APPARATUS FOR CONTINUOUS INDUCTIVE TRANSMISSION SYSTEM
Simon Reich, Rochester, N.Y., assignor to General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed Jan. 24, 1963, Ser. No. 253,612
11 Claims. (Cl. 246—63)

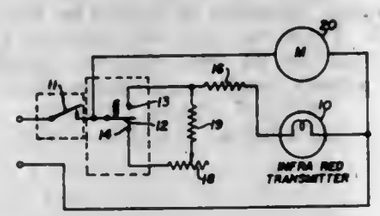
1. In a continuous inductive system for a railway vehicle wherein time spaced pulses of electrical energy of a predetermined characteristic are transmitted recurrently from wayside to the vehicle at a selected one of a plurality of code rates to govern the operation of the vehicle in accordance with the rate of recurrence of the pulses, comprising means on the vehicle to receive each pulse, code following means operatively connected to the receiving means to operate to each one of two conditions in response to the reception of each pulse, a timing means for each one of the plurality of code rates effective when activated to produce an output after a time interval corresponding to a respective one of the plurality of code rates, means responsive to the operation of the code following means to one condition effective to activate each of the timing means only during alternate pulses, means controlled by the operation of the code following means to its other condition upon termination of each of the alternate pulses to cause deactivation of the timing means upon the subsequent operation of the code following means in response to a next pulse, and means responive to the recurrent output of each timing means occurring prior to each operation of the code following means to its one condition in response to said next pulses respectively to govern selectively the operation of the railway vehicle.

3,272,980
INTERMITTENT TRAIN CONTROL SYSTEM
Sydney W. Freeman, Rochester, N.Y., assignor to General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed Feb. 25, 1963, Ser. No. 260,661
8 Claims. (Cl. 246—63)



1. In a train control system wherein a normally energized electro-responsive valve circuit means on a vehicle is deenergized to apply the brakes of the vehicle by electro-magnetic means operated in response to the influence of a device that is adapted to be positioned along the wayside, and wherein acknowledging means when manually operated during operation of the electro-magnetic means maintains the electro-responsive valve circuit means energized, the combination of a receiving means on the vehicle responsive to a signal received from a wayside transmitting means that is disposed along the wayside ahead of the wayside device as the vehicle passes the transmitting means, a normally inactive distance detecting means on the vehicle operative when active to deenergize the valve circuit means when the vehicle travels a predetermined distance after being activated, a first means normally in one condition and operated to its other condition in response to the operation of either one of the acknowledging means and the electro-magnetic means to activate the distance detecting means, a second means normally in one condition and operated to its other condition in response to the detected operation of both the acknowledging means and the electro-magnetic means, a third means responsive to the signal received by the receiving means when the second means is in its other condition to operate the first means to its one condition to deactivate the distance detecting means before the vehicle has traversed all of said predetermined distance of travel, and a fourth means responsive to the reception of a signal from the receiving means when the first means is in its one condition to deenergize the valve circuit means.

3,272,981
INTERMITTENT INDUCTIVE TRANSMISSION SYSTEM
William J. Matthews, Rochester, N.Y., assignor to General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed Apr. 4, 1963, Ser. No. 270,615
10 Claims. (Cl. 246—63)



1. An intermittent inductive system for communicating information from the wayside to a moving vehicle comprising, a pair of transmitting coils disposed along the wayside, one of the coils being disposed ahead of the other in the direction of travel of the vehicle, each of the coils being tuned to a selected distinctive frequency, receiving means on the vehicle having a sweep frequency oscillator connected to a receiving coil positioned to be influenced by the distinctive frequency to which each of the transmitting coils is tuned when the

receiving coils passes in close proximity with the transmitting coils respectively, acknowledging means on the vehicle activated for a predetermined time interval in response to manual operation thereof, first and second means on the vehicle for registering the reception of distinctive frequencies of the respective transmitting coils as they are received by said receiving means, information output means on the vehicle operative when activated to provide a single information code in response to the

distinctive frequencies registering by said first and second means jointly, control means governed by the acknowledging means and the first and second means operative to activate the output means in response to the reception of the vehicle from both of the transmitting coils provided such reception is within the predetermined time interval and only provided that the distinctive frequencies registered by said first and second means are in a predetermined order as to relative frequency values.

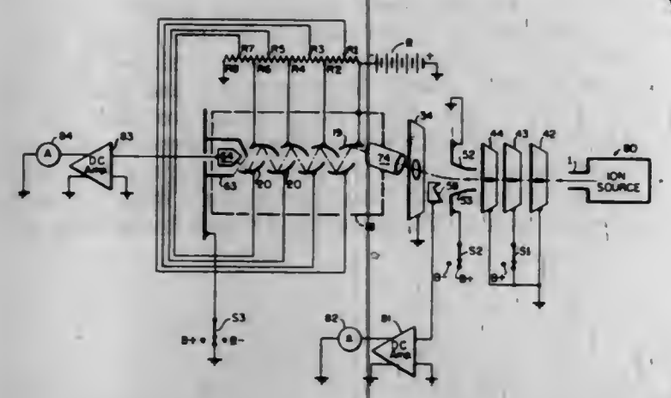
INFRARED REMOTE CONTROLLER
John K. Stewart, 60 Ballantyne Terrace, Dorval, Quebec, Canada
Filed Mar. 26, 1963, Ser. No. 268,079
Claims priority, application Canada, May 25, 1962, 850,058
4 Claims. (Cl. 246—187)

1. Distance control means for use in a railroad surveying system including a main rail car and a satellite rail car having a prime mover, which control means comprises a high frequency beam source; means on the main car for directing a command high frequency beam towards the satellite rail car; a beam receiver on said satellite rail car to receive the command high frequency beam; and means on the satellite rail car responsive to the intensity of the received beam to control the prime mover to selectively drive the satellite car towards or away from said main rail car, whereby to regulate the distance therebetween.

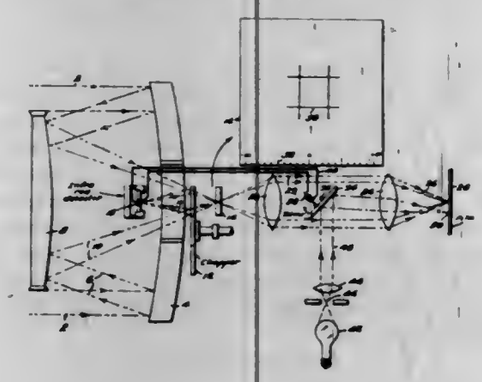
3,272,983
ION-PRODUCING MECHANISM FOR CALUTRONS
Allen M. Veach and Oliver C. Yonts, Oak Ridge, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed Jan. 10, 1964, Ser. No. 337,112
1 Claim. (Cl. 250—41.9)

In a calutron, an improved ion-producing mechanism comprising a unitized graphite enclosure defining both an arc chamber section and an oven section, said oven section being provided with a large central cavity, a charge bottle adapted to contain therewithin a charge material, said charge bottle being disposed within said large cavity, first heaters disposed adjacent to two sides of said charge bottle within said large cavity for heating and vaporizing said charge material, said arc chamber section being provided with a second cavity for the ionization of the vapors from said charge material and at least one heater cavity of rectangular cross section with a second heater disposed therein and in close proximity to said second cavity for supplying heat thereto, said second cavity being subdivided by a perforated baffle into a vapor manifold region and an ionizing region, a slotted graphite insert adjacent to said ionizing region and defining an ion exit slit, said charge bottle being provided with at least two vapor-exit nipples extending therefrom into said vapor manifold region for conveying vapors from said charge bottle directly into said manifold region, a baffle provided with a third heater, said heated baffle being dis-



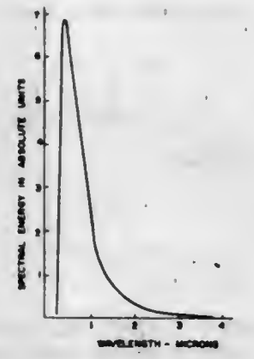
posed within said ionizing region and defining a narrow channel behind said ion exit slit for directing said feed vapors from said manifold region into the path of an arc discharge passing through said narrow channel for ionizing said feed vapor, a divergent channel and collection chamber communicating directly with said narrow channel, and means for cooling said collection chamber, said chamber being bottom vented by means of a plurality of water cooled baffles, whereby substantially all of said feed vapor which is not ionized by said arc discharge is withdrawn into said divergent channel and condensed within said cooled chamber thereby essentially eliminating contamination of other calutron components from any charge material reactive constituents and also preventing high pressures from existing in the accelerating regions of the calutron unit.

3,272,984
ELECTRON MULTIPLIER FOR MEASURING THE FLOW OF POSITIVELY CHARGED PARTICLES
Richard F. Herzog, Lexington, Gerhard O. Sassermann, Burlington, and William J. McMahon, Watertown, Mass., assignors to GCA Corporation, Bedford, Mass., a corporation of Delaware
Filed June 7, 1963, Ser. No. 286,264
13 Claims. (Cl. 250—83)



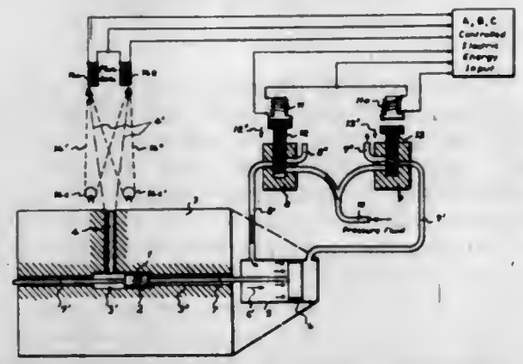
12. Apparatus for measuring the flow of positively charged particles, comprising an evacuated ferromagnetic housing, a first collector electrode mounted in said housing and insulated therefrom, an electron multiplier comprising a second collector electrode and a series of dynodes interconnected by resistors and arrayed to form an electron multiplier, said series having an input end comprising a first dynode and an output end comprising a last dynode confronting said second collector electrode, a conductive housing surrounding said dynodes and electrically connected to said first dynode, means for applying a negative potential to said first dynode with respect to said last

dynode, an ion lens comprising an aperture in said housing for focusing a stream of ion on said first dynode, an aperture in said ferromagnetic housing comprising means defining a slit for admitting a beam of ions to said housing, a pair of deflector electrodes on either side of the



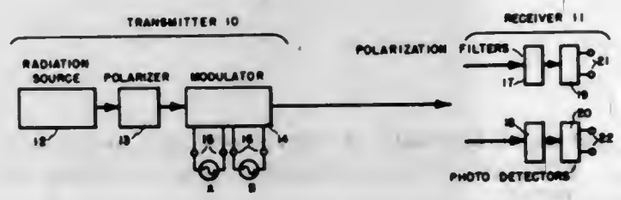
beam defined by the slit within the ferromagnetic housing, and means for selectively applying a first or a second potential to said deflector electrodes to direct a beam of ions flowing through said slit to said first collector electrode or said ion lens, respectively.

3,272,985
INFRARED RADIOMETER-PHOTOGRAPHIC APPARATUS
Jack H. Hayes, El Paso, Tex., assignor to the United States of America as represented by the Secretary of the Army
Filed Dec. 11, 1963, Ser. No. 329,929
2 Claims. (Cl. 250—83.3)



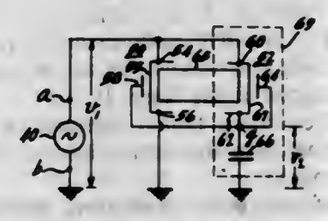
1. Apparatus for receiving radiations from an object in both the visible and the infra-red spectrums comprising:
condensing reflector apparatus to concentrate the radiations;
a chopper, to pass the radiations and to reflect the radiations alternately, placed in the path of radiations being received;
a detector located to intercept infra-red type of radiations being received;
a detector located to intercept visible type radiations being received;
the apparatus thereby utilizing the same condensing reflector apparatus to concentrate both types of radiations and wherein the chopper reflects incoming radiations to the infra-red detector at one period of time and passes incoming radiations on through the systems to the second-mentioned detector at another period of time.

3,272,986
SOLAR HEAT ABSORBERS COMPRISING ALTERNATE LAYERS OF METAL AND DIELECTRIC MATERIAL
Roger N. Schmidt, Minnetonka, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed Sept. 27, 1963, Ser. No. 312,034
5 Claims. (Cl. 250—86)



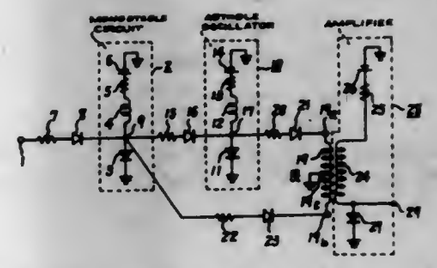
4. A solar heat absorber exhibiting high absorption in the solar spectral region and low emissivity in the infrared region comprising: an opaque molybdenum substrate; and at least one dielectric film and molybdenum film respectively placed thereon in laminar relationship to provide a surface adapted to be exposed to solar radiation, said dielectric ranging from about ¼λ at 0.2 micron to about ¼λ at 0.5 micron in optical thickness, said molybdenum film ranging from about 500 ohms/square to about 2000 ohms/square in resistivity.

3,272,987
ARRANGEMENT FOR IRRADIATING AN OBJECT WITH RADIOACTIVE RADIATION
André Kohn, Saint-Germain-en-Laye, and Jean Aupée, Le Pecq, France, assignors to Institut de Recherches de la Siderurgie Francaise, Saint-Germain-en-Laye, France
Filed Oct. 24, 1962, Ser. No. 232,827
Claims priority, application France, Nov. 7, 1961, 878,165, Patent 1,313,153
13 Claims. (Cl. 250—106)



1. An arrangement for irradiating an object with radioactive radiation, comprising, in combination, container means composed predominantly of material absorbing radioactive radiation and including an inner chamber of predetermined dimensions, said container means further including a channel leading in a predetermined direction from a selected portion of said inner chamber to the outside of said container means; a body of radioactive material arranged within said inner chamber and having dimensions smaller than those of said inner chamber so as to be movable therein between a first position in which said body of radioactive material is located opposite the inner end of said channel whereby its radiation is released to the outside in said direction of said channel toward an object that may be present opposite the outer end of said channel, and a second position in which said body of radioactive material is located within said inner chamber at a distance from said inner end of said channel whereby said radiation is blocked from reaching the outside; moving means for alternatively moving said body of radioactive material from said first position to said second position, and vice versa; and control means in operative proximity with said body of radioactive material and in the area of said object and electrically connected to said moving means for controlling the operation of said moving means in accordance with the position of said object relative to said radiation.

3,272,988
POLARIZATION MODULATION SYSTEM FOR TRANSMITTING AND RECEIVING TWO INDEPENDENT SIGNALS OVER A SINGLE ELECTROMAGNETIC CARRIER
Louis R. Bloom, Westbury, and Carl F. Buhrer, Hempstead, N.Y., assignors to General Telephone and Electronics Laboratories, Inc., a corporation of Delaware
Filed Mar. 25, 1963, Ser. No. 267,599
13 Claims. (Cl. 250—199)

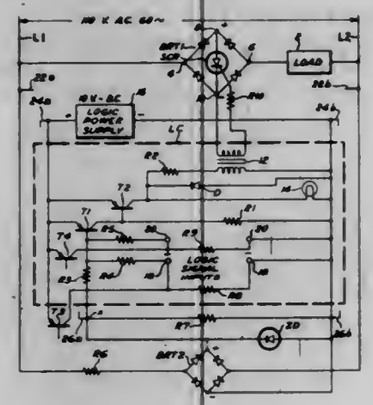


13. In a signal transmission system for modulating a light beam by first and second independent signals and for detecting said signals, a receiver comprising
(a) a polarizing prism for receiving a light signal having horizontally and vertically polarized components, one of said components being transmitted along a first path in said prism and the other of said components being transmitted along a second path in said prism,
(b) first and second photocells positioned in the paths of said first and second components respectively, and
(c) means for combining the output of said first and second photocells, the output of said means being proportional to one of said independent signals.

3,272,989
INTEGRATED ELECTRICAL CIRCUIT
Michael E. Sekely, Belle Mead, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Dec. 17, 1963, Ser. No. 331,271
7 Claims. (Cl. 307—88.5)

1. An integrated circuit comprising in combination:
a semiconductor device having input, common and control electrodes formed on a substrate of semiconductor material;
a pair of input terminals for applying an input signal voltage V_1,
a phase shifting network formed on said substrate and connected between said input terminals for deriving a voltage V_2 having a phase angle θ with respect to said input voltage V_1, said phase shifting network including resistive circuit means and capacitive circuit means,
means for connecting said input and common electrodes to said pair of input terminals, and
circuit means coupled to said control electrode for applying said voltage V_2 so that the net current flowing through said input terminals lags said input voltage V_1.

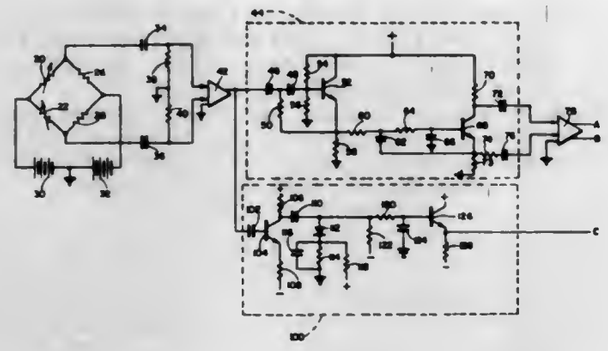
3,272,990
OSCILLATORY TYPE NOT LOGIC CIRCUITRY
Takuya Kawamoto, Tokyo, and Shinji Tomita, Yokosuka-shi, Kanagawa-ken, Japan, assignors to Sony Corporation, Tokyo, Japan, a corporation of Japan
Filed Jan. 15, 1962, Ser. No. 166,074
Claims priority, application Japan, Jan. 18, 1961, 36/1830
11 Claims. (Cl. 307—88.5)



9. In a logic circuit arranged to respond to an input signal containing numerical information indicated by the presence and absence of an A.C. signal component of a certain frequency, an astable oscillator operable continuously at a frequency approximately equal to said certain frequency and arranged to be controlled in response to an A.C. input signal component to be synchronized therewith, a differential circuit, means for applying a first signal to said differential circuit from said oscillator, means for applying a second signal to said differential circuit corresponding to an A.C. input signal component, said first and second signals being of the same order of amplitude and being applied in phase opposition in said differential circuit to produce an A.C. output signal from said differential circuit in the absence of an A.C. input signal component which is substantially greater than any output signal produced from said differential circuit in the presence of an A.C. input signal component, a tunnel diode having two terminals, coupling means for respectively coupling said terminals to opposite terminals of a D.C. source, impedance means included in said coupling means for causing operation of said tunnel diode as an amplifier, and means applying the output from said differential circuit to said amplifier.

3,272,991
STATIC SWITCH
Gene C. Lutsch, Hales Corners, and Carl J. Weiss, Milwaukee, Wis., assignors to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Filed Nov. 23, 1962, Ser. No. 239,693
7 Claims. (Cl. 307—88.5)

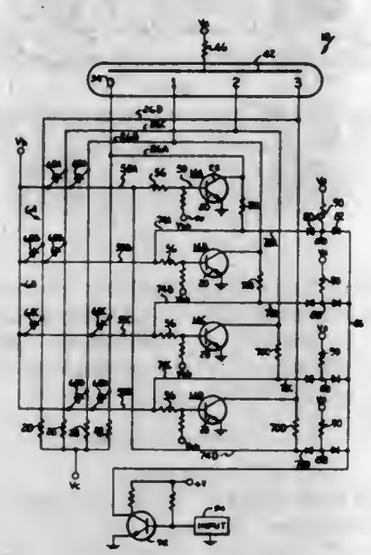
5. In a static switching system for energizing a load device, in combination:
(a) an A.C. power supply source;
(b) a controlled rectifier;
(c) means comprising rectifier means connecting said source to said controlled rectifier and to said load



device whereby said controlled rectifier controls current flow to the load device;
(d) and means for controlling said controlled rectifier to render it conducting comprising;
(e) a first transistor and a second transistor;
(f) means comprising a D.C. power supply source and circuit means for supplying operating voltage to said transistors and for supplying control voltage to said first transistors normally to render the latter conducting;
(g) means connecting said first transistor to said second transistor whereby conduction in said first transistor renders said second transistor non-conducting and non-conduction in said first transistor renders said second transistor conducting;

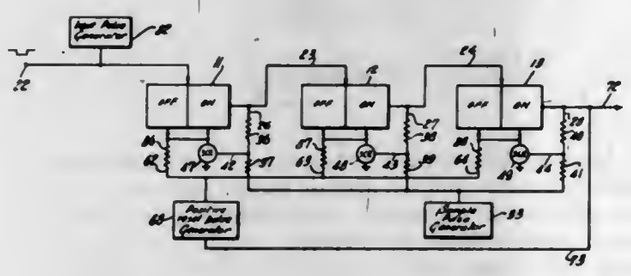
(h) and means for applying to said first transistor a synchronizing voltage and two input voltages all of which must be applied thereto to render it non-conducting comprising;
(i) means comprising rectifier means connected to said A.C. source for applying to said first transistor a voltage synchronized with the voltage applied from said A.C. source to said controlled rectifier;
(j) and means for applying to said first transistor two D.C. input voltages which together with said synchronized voltage renders said first transistor non-conducting thereby to render said second transistor conducting;
(k) and means connected to said second transistor for applying a firing voltage pulse to said controlled rectifier to render the latter conducting and to energize the load device.

3,272,992
STAR TRACKER SIGNAL CONDITIONER OF AMPLITUDE, FREQUENCY, SLOPE AND WIDTH
James D. Carpenter, Long Beach, Calif., assignor to North American Aviation, Inc.
Filed June 28, 1963, Ser. No. 291,557
9 Claims. (Cl. 307—88.5)



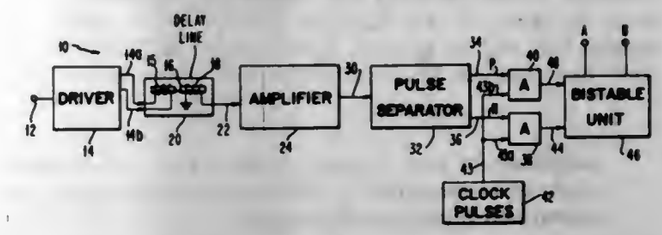
1. An electronic circuit for generating a spike voltage indicating the presence of a pair of signal pulses of predetermined polarity sequence, minimum slope, minimum pulse width, and maximum pulse width comprising:
a first rectangular wave generator adapted to generate a first singular rectangular pulse of a first predetermined time duration when a negative signal is applied to its input terminals;
a second rectangular wave generator responsive to input signals of positive slope, adapted to generate as an output signal a second single rectangular pulse of a second predetermined time duration and to extinguish its output signal when a positive slope signal is applied to its input terminals during said predetermined time duration;
a third rectangular wave generator connected to receive the output signal of said first generator and said second generator, adapted to generate a third single rectangular pulse equal in length to said second pulse plus a predetermined time period;
a fourth rectangular wave generator adapted to generate a fourth single rectangular pulse of a fourth predetermined time duration when a negative signal is applied to its input terminals;
signal receiving terminals;
signal inverting means, connected to receive signals from said receiving terminals and to deliver an inverted signal to the input of said first generator;

the input terminals of said second and fourth wave generators being connected to said receiving terminals;
spike voltage generating means connected to the output terminals of said third wave generator to generate a spike at the occurrence of the trailing edge of the output signal of said third generator; and
means connected to the outputs of said first, second and fourth wave generators for inhibiting the generation of a spike by said spike voltage generating means when said first generator has an output signal, or when said second generator has on output signal, or when said fourth generator has no output signal.



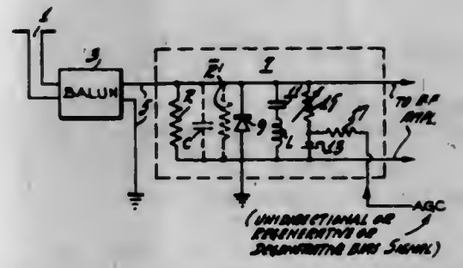
3,272,993
SEMICONDUCTOR GATING CIRCUITS FOR COUNTER EMPLOYING SINGLE SIGNAL SOURCE AND DIODE MATRIX FOR EFFECTING SEQUENCING
Arpad Somlyody, Raritan, N.J., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Dec. 4, 1963, Ser. No. 327,986
2 Claims. (Cl. 307—88.5)

1. A counting circuit including
a plurality of counting stages, each comprising a counting device having input and output electrodes,
all of said devices being interconnected so that only one device at a time can register a count,
each input electrode being connected through a first diode and a resistive path to a voltage source and through said first diode and a second diode to a common signal input line,
a source of counting pulses comprising a pulse generating semiconductor device having input and output electrodes,
the output of said pulse generating semiconductor device being connected to said signal input line and thus through said first and second diodes to the input electrode of each of said counting devices,
said pulse generating semiconductor device being normally on and being turned off to generate an input counting pulse on said signal input line,
said pulse generating semiconductor device being normally on so that current flows from said voltage source through all of said second diodes to ground, said current flow serving to block all of said first diodes except the first diode positioned between a counting device which is on and the next adjacent counting device which is off, this excepted first diode



being in a primed state so that, when said pulse generating semiconductor device is turned off and generates an input count pulse, only the excepted first diode can pass the count pulse and only the next adjacent device can be turned on thereby to register a count.

3,272,994
VARIABLE CAPACITY BINARY COUNTER
William F. Brown, Wappingers Falls, N.Y., assignor to Texaco Inc., New York, N.Y., a corporation of Delaware
Filed May 15, 1964, Ser. No. 367,790
13 Claims. (Cl. 307—88.5)

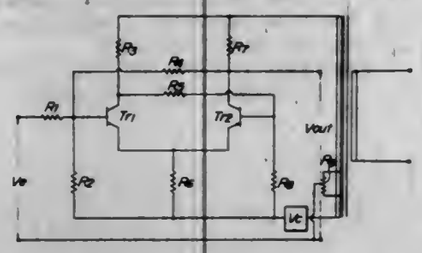


1. In a binary pulse counter having an input, an output and a plurality of cascaded two-state circuits; the combination comprising means for providing a predetermined count within said counter, means separate from the counter input for reversing the state of said two-state circuits, means for sampling the state of each of said two-state circuits, means for providing an output pulse from said counter when a full capacity count in said counter has been reached, means for energizing said reversing means to provide a further reversal of said two-state circuits upon receipt of said output pulse from said counter, and means for preventing said further reversal of said two-state circuits having a predetermined state when sampled by said sampling means, thereby setting the counter to repetitively count to a capacity determined by said predetermined count.

3,272,995
APPARATUS FOR TRANSLATING A WAVEFORM
David C. Alexander, Yorktown Heights, and Robert H. Dennard, Croton-on-Hudson, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 1, 1964, Ser. No. 379,519
12 Claims. (Cl. 307—88.5)

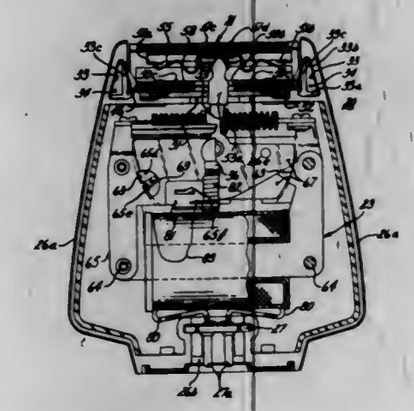
1. Apparatus for waveform translation comprising, in combination:
first magnetostrictive delay line means to provide a plurality of pulse doublets from said waveform;
second means to provide pulses from said doublets; and
third means operable by said pulses to provide a replica of said waveform.

3,272,996
SIGNAL LIMITER
Wen Yuan Pan, Haddon Heights, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Dec. 31, 1959, Ser. No. 863,132
10 Claims. (Cl. 307—88.5)



1. A signal limiting circuit comprising a semiconductor tunnel diode having an operating characteristic with positive conductance and negative conductance portions, means for applying signals to said diode, means for biasing said diode to operate at a selected negative conductance value in the absence of applied signals, resistive means effectively coupled in parallel with said diode, said resistive means having a resistance value relative to that of the negative resistance of said diode to present in combination with said diode a high shunt positive impedance to said applied signals having an amplitude below a selected value and to attenuate said applied signals above said selected value substantially to said selected value, and automatic gain control means coupled to said diode for changing the bias applied to said diode as a function of the amplitude of the signals applied to said diode.

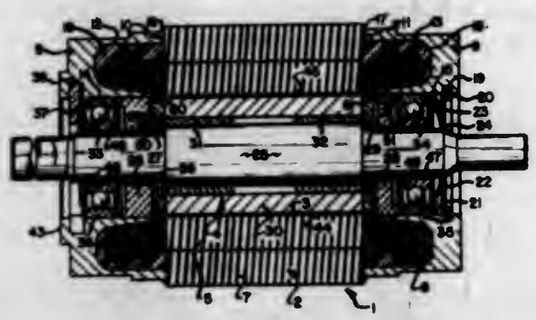
3,272,997
ON-OFF SIGNAL GENERATORS
Naokazu Kimura, Katsuta-shi, Japan, assignor to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan
Filed Dec. 16, 1964, Ser. No. 418,605
9 Claims. (Cl. 307—88.5)



1. A device for detecting the amplitude of a signal applied thereto as compared to a reference quantity represented by a reference voltage comprising:
bistable circuit means including a pair of cross coupled parallel connected amplifiers capable of selectively providing respective stable states of amplification and bistable operation in dependence upon the power supply voltage applied thereto,

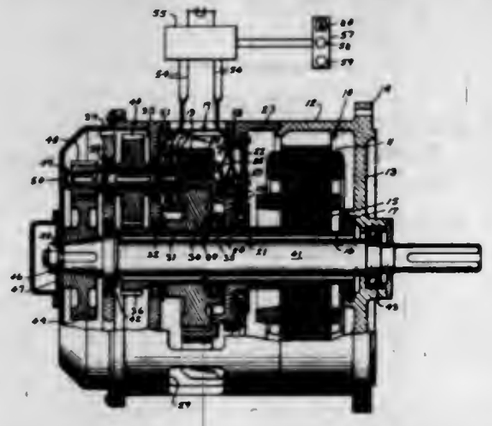
alternating current voltage supply means providing said power supply voltage connected in parallel with the

amplifiers of said bistable circuit means for continuously and repetitively switching said circuit means between said respective stable states.



3,272,998
VIBRATOR MOTOR FOR ELECTRIC SHAVER
Albert R. Spohr, Park Ridge, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Original application June 7, 1963, Ser. No. 286,248, now Patent No. 3,218,708, dated Nov. 23, 1965. Divided and this application June 21, 1965, Ser. No. 465,472
4 Claims. (Cl. 310—22)

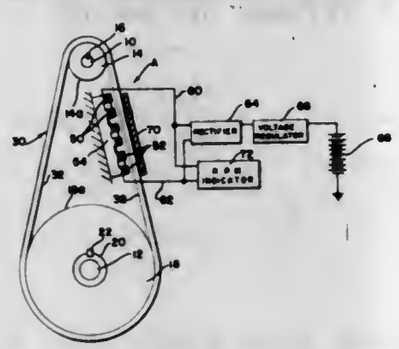
1. A motor comprising a vibratory type motor having a pair of armatures mounted for oscillation about a common axis, said motor having a field with two spaced poles, frame means carried by said field and supporting said armatures, spring means biasing said armatures to rest positions in which they are diplaced with respect to said field poles whereby energization of said field causes said armature to rotate in opposite directions into alignment with each other and with said field poles, said spring means being adjustable with respect to said frame means to establish said rest position with said armatures displaced an equal angular amount in opposite directions from an aligned position with respect to said field poles.



3,272,999
AIR BEARINGS FOR DYNAMOELECTRIC MACHINE
James R. Turk, Solon, Ohio, assignor to Vincent K. Smith, Gates Mills, Ohio
Filed Oct. 17, 1963, Ser. No. 316,884
9 Claims. (Cl. 310—90)

1. A dynamoelectric machine comprising a stator assembly having a smooth cylindrical bore; a rotor having a rotor shaft concentrically disposed within said bore, said rotor having a smooth cylindrical surface which is complemental with the surface of said station bore and defines therewith a minute air gap in which there is produced an air film when said rotor is rotated at operational speeds; ball bearings disposed adjacent the ends of said stator assembly, the ends of said rotor shaft being journaled in said ball bearings; minute air gaps between the ends of said rotor shaft and said ball bearings, said air gaps being slightly smaller than the air gap between the surfaces of said bore and rotor so that when the rotor is at rest or is rotating at starting and stopping

speeds, said rotor is maintained out of contact with said stator, but sufficiently large to constitute an air film when said rotor is rotating at operational speeds; said air films being adapted to maintain the ends of said rotor shaft out of contact with said bearings.



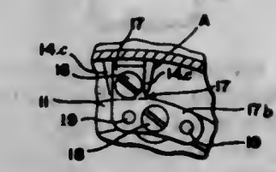
3,273,000
VARIABLE SPEED THRU-MOTOR DRIVE
Walter P. Schmitter, deceased, late of Wauwatosa, Wis., by A. Louise Schmitter, Wauwatosa, Wis., and Robert V. Abendroth, Whitefish Bay, Wis., co-executors, and David G. Bernard, Milwaukee, Wis., assignors to The Falk Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed Jan. 8, 1963, Ser. No. 250,189
6 Claims. (Cl. 310—98)

1. In a variable speed power drive, the combination comprising: a housing; an electric motor having a hollow motor drive shaft journaled in said housing; an electromagnetic slip coupling including torque transmitting driving and driven rotors that are rotatable relative to each other and electromagnetic means on one of said rotors reacting on the other of said rotors to impart the torque transmitting function thereto, said driving rotor being secured about said hollow drive shaft for rotation in response to said motor; a quill shaft journaled in said housing coaxial with and axially spaced from said hollow drive shaft, said quill shaft mounting said driven rotor for rotation therewith; a pinion on said quill shaft; an intermediate shaft journaled for support in said housing in parallel spaced relationship with said hollow drive shaft and said quill shaft, the ends of said intermediate shaft projecting beyond its supports in said housing; an intermediate gear within said housing and affixed to said intermediate shaft in meshing engagement with said pinion; a driven output shaft journaled in said housing and extending through said quill shaft and said hollow drive shaft and outwardly of said housing at each end thereof; a pair of meshing gears respectively removably

mounted on adjacent projecting ends of said intermediate and output shafts and forming one of a plurality of sets change gears having different gear ratios; a cover removably applied to said housing to form an enclosure for said last named pair of gears and for said projecting ends of said intermediate and output shafts; a tachometer generator having its stator secured within said housing and its rotor secured to an opposite projecting end of said intermediate shaft, said tachometer generator adapted to produce an output signal proportional to the speed of said intermediate shaft; and means for modifying and regulating the strength of said electromagnetic means to vary the speed of said driven output shaft, such means being responsive to the output signal of said tachometer generator to maintain a selected speed for said driven output shaft.

3,273,001
PERMANENT MAGNET DEVICE FOR GENERATING ELECTRICAL ENERGY
Max Baermann, Bensberg, Wulfshof, Bezirk Cologne, Germany
Filed June 1, 1965, Ser. No. 460,203
10 Claims. (Cl. 310—152)

1. In a device for generating electrical energy, said device comprising: a flexible belt, means for moving said belt longitudinally along a preselected path, said belt having a plurality of alternate north and south magnetic poles longitudinally spaced along one surface of said belt with magnetic lines of force extending outward from said one surface and between said adjacent poles and an electric coil means positioned adjacent said path and opposite said one surface, said lines of force intersecting said coil means as said belt moves past said coil means whereby electrical energy is generated within said coil means, the improvement comprising: said flexible belt drivingly coupling a rotatable driving drum and a rotatable driven drum, said drums each having an outer, peripheral driving surface for receiving said belt, a set of alternate north and south magnetic poles equally spaced in a circumferential direction on said peripheral surfaces, the longitudinal spacing of said poles on said belt being substantially equal to the circumferential spacing of said poles on said drum surfaces and said belt poles being on the surface of said belt contacting said drum surfaces.



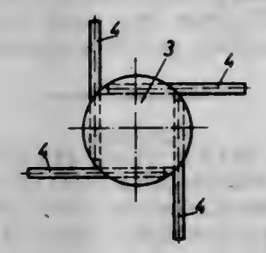
3,273,002
ELECTRIC MOTOR
Le Roy H. Easton, Cuyahoga Falls, Ohio, assignor to Ametek, Inc., New York, N.Y., a corporation of Delaware
Filed Oct. 14, 1963, Ser. No. 315,752
7 Claims. (Cl. 310—191)

1. In a commutating dynamo electric machine, including a casing member adapted to receive through one end a field having a field core member, field seating and securing structure comprising:

said casing member having near its other end shoulder means adapted to engage endwise a corresponding first end of said core member and also having interior surface portions adapted to engage the core member on peripheral portions;

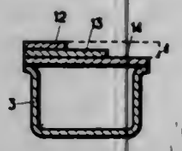
said shoulder means and surface portions forming a core seat;

said field core member having external arcuate portions engaged by said surface portions of the casing member whereby the core may be shifted rotationally about a shaft axis of the machine at least through a limited angle relative to the said casing member and to brushes mounted thereon; and core



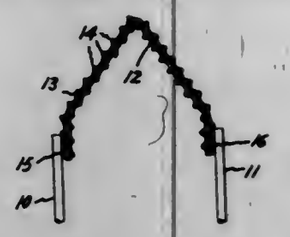
clamping means including at each of a plurality of angularly spaced positions

a respective clamp member spanning and secured to adjacent end portions of the casing member and of the other end of the core member, and



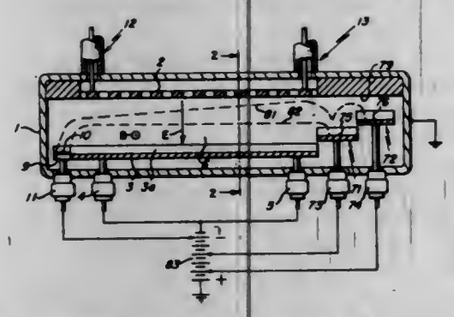
means securing the clamp member to the casing member and core member, the last said means including a series of angularly spaced apertures in one of said members for selectively receiving a clamping screw engaged in an aperture of another of said members, said apertures being spaced along an arc coaxial with said axis.

3,273,003
SUPPORTING MEMBERS FOR A HOT CATHODE BLOCK
Walter Dietrich, Hanau am Main, Germany, assignor to W. C. Heraeus G.m.b.H., Hanau am Main, Germany, a corporation of Germany
Filed Feb. 6, 1963, Ser. No. 256,588
Claims priority, application Germany, Feb. 17, 1962, H 44,917
2 Claims. (Cl. 313—82)



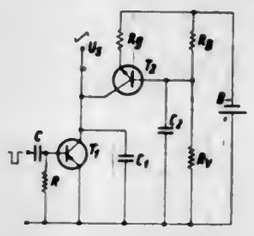
1. Means for centrally mounting a hot cathode block in an electron gun comprising, a pair of opposed diametrically spaced straight parallel grooves formed in the periphery of said cathode block, and a pair of similar straight rods, one of said rods being disposed in one of said grooves in frictional engagement with the bottom and side walls of said one of said grooves and extending outwardly therefrom in one direction parallel to the said bottom wall of the said one of said grooves, and the other of said rods being disposed in the other of said grooves in frictional engagement with the bottom and side walls of the said other of said grooves and extending outwardly therefrom parallel to the said bottom wall of the said other of said grooves in a direction opposite to the direction in which the said one of said rods extends outwardly from the said one of said grooves, the outer ends of said rods being adapted to be secured in fixed position to said electron gun, said mounting means being operative to compensate for the expansion or contraction of said cathode block due to temperature changes of said cathode block during operation.

3,273,004
CATHODE STRUCTURE IN A REFLEX KLYSTRON TUBE
Daniel Reverdin, Paris, France, assignor to CSF—Compagnie Generale de Telegraphie Sans Fil, Paris, France
Filed June 15, 1962, Ser. No. 202,802
Claims priority, application France, June 21, 1961, 865,579
10 Claims. (Cl. 313—310)



1. In a reflex klystron oscillator provided with a substantially axial direction, a primary electron source having at least one one first point and at least one second point of emissive surface, said first and second points being spaced in the axial direction of said klystron by a distance d substantially equal, in millimeters, to $50\sqrt{V_o}/f$, wherein V_o is the anode voltage in volts of said klystron, and f is the operating frequency in megacycles.

3,273,005
ELECTRON EMITTER UTILIZING NITRIDE EMISSIVE MATERIAL
James M. Lafferty, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed Apr. 1, 1963, Ser. No. 269,352
6 Claims. (Cl. 313—346)

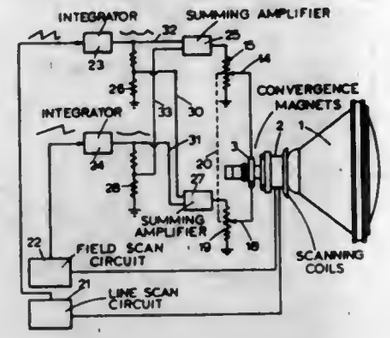


1. A thermionic cathode including an emitter consisting essentially of at least one metal nitride selected from the group consisting of the nitrides of thorium, uranium, and the lanthanide series rare earth metals, and means supporting said emitter providing a conductive connection therewith.

3,273,006
TRAVELING WAVE TUBE HAVING A CONTOURED ANODE COLLECTING SURFACE
John M. Osepchuk, Lexington, Mass., assignor to Raytheon Company, Lexington, Mass., a corporation of Delaware
Filed Feb. 1, 1962, Ser. No. 170,470
5 Claims. (Cl. 315—3.5)

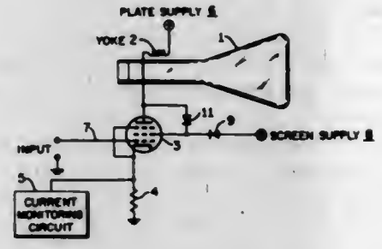
1. A traveling wave tube comprising:
a slow wave propagating structure;
a cathode injecting electrons into an interaction space adjacent said structure wherein said electrons exchange energy with waves propagating in said structure;
means for producing a magnetic field transverse to said interaction space;
means including a plurality of electrodes each having electron collecting surfaces and each energized at a different potential disposed at the end of said interaction space;
and a contoured collecting anode disposed adjacent to said slow wave propagating structure and spaced from said electron collecting surfaces to produce therewith progressively varying electric field strengths to intercept and direct to the respective electron collecting surfaces electrons issuing from said interaction space at levels of total kinetic and potential energy closely equivalent to the respective varying electric field strengths adjacent said collecting surfaces.

3,273,007
CIRCUIT ARRANGEMENT FOR PRODUCING A SAWTOOTH WAVEFORM OF HIGH LINEARITY
Hans-Dieter Schneider, Gross-Gerau, Germany, assignor to Fernseh G.m.b.H., Darmstadt, Germany
Filed Apr. 10, 1963, Ser. No. 271,978
Claims priority, application Germany, Apr. 11, 1962, F 36,527; Sept. 20, 1962, F 37,844
15 Claims. (Cl. 315—27)



1. A sawtooth voltage generator circuit arrangement for providing a determined type of sawtooth voltage, comprising a capacitor for producing a sawtooth voltage; and a time constant circuit directly connected in series with said capacitor for controlling the charging and discharging of said capacitor by a time constant which provides an exponential function having a curvature opposed to the curvature of the charging voltage of said capacitor.

3,273,008
DYNAMIC CONVERGENCE SYSTEMS FOR COLOUR KINESCOPES
Robert de Peignefort Galloway, Addlestone, Weybridge, Surrey, and Eric William Bull, Hounslow, Middlesex, England, assignors to Electric & Musical Industries Limited, Hayes, England, a company of Great Britain
Filed June 17, 1963, Ser. No. 288,305
Claims priority, application Great Britain, June 20, 1962, 23,683/62
10 Claims. (Cl. 315—27)

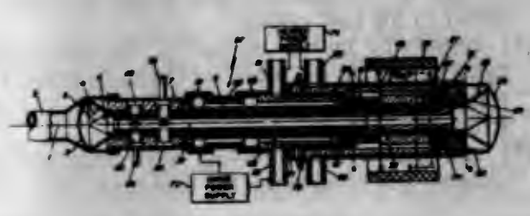


6. A circuit arrangement for controlling the dynamic convergence of a three gun cathode ray tube for displaying coloured images, comprising electromagnetic means associated with each gun which when energised by convergence currents set up magnetic fields causing convergence movements of the beams from each of said guns, two of said electromagnetic means being substantially symmetrically located with respect to the vertical plane containing the axis of the cathode ray tube, means for developing a substantially parabolic waveform of line scanning frequency, means for developing a substantially parabolic waveform of frame scanning frequency, means for energising said two electromagnetic means by similar convergence currents in response to said waveforms to set up respective dynamic convergence magnetic fields each including components of line and frame scanning

frequencies, means for energising the remaining said electromagnetic means by convergence current in response at least to said waveform of line scanning frequency to set up a respective dynamic convergence magnetic field including at least a component of line scanning frequency,

and control means for controlling the amplitude of the line and frame frequency components of the time varying components of the resultant magnetic fields set up by said convergence currents substantially without changing the relative amplitudes of the line and frame frequency components.

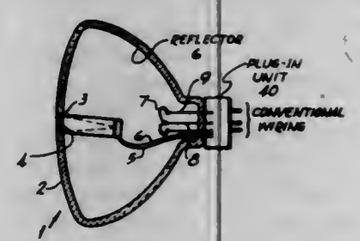
3,273,009
YOKE DRIVING CIRCUIT WHICH REDUCES TRANSIENTS
Carlos A. Tomaszewski, Canoga Park, Calif., assignor, by mesne assignments, to Stromberg-Carlson Corporation, Rochester, N.Y., a corporation of Delaware
Filed Jan. 2, 1964, Ser. No. 335,194
5 Claims. (Cl. 315—27)



4. In combination, a multi-element electron tube having at least an anode, a cathode, a control grid and a screen grid; a cathode-ray tube having a beam-positioning electromagnetic yoke winding associated therewith, a power supply having a first terminal for supplying B+ to the anode of said electron tube, a second terminal for applying a positive D.C. screen potential to the screen electrode of said electron tube and a third ground reference potential terminal, means for coupling the cathode of said electron tube to the third terminal of said power supply, means for coupling said yoke winding between the first terminal of said power supply and said anode, an input circuit coupled to the control grid of said electron tube for abruptly increasing the current flowing through said tube thereby to reduce the potential at the plate of said electron tube below the potential at the second terminal of said power supply, means for effectively coupling said screen grid to said plate and for decoupling said screen grid from the second terminal of said power supply as long as the potential at said anode is higher than a predetermined voltage somewhat lower than the potential at the second output terminal of said power supply and for effectively decoupling the screen grid from said plate and for causing the second terminal of said power supply to be effectively coupled to said screen grid as long as the voltage at said anode remains below said predetermined voltage.

3,273,010
ARC ARRESTING SPARK GAP ASSEMBLY FOR LIGHTNING ARRESTERS
Joze Sacer, Neuenhof, Switzerland, assignor to Aktiengesellschaft Brown, Boveri & Cie., Baden, Switzerland, a joint-stock company
Filed Nov. 22, 1963, Ser. No. 325,698
Claims priority, application Switzerland, Nov. 28, 1962, 13,950/62
6 Claims. (Cl. 315—36)

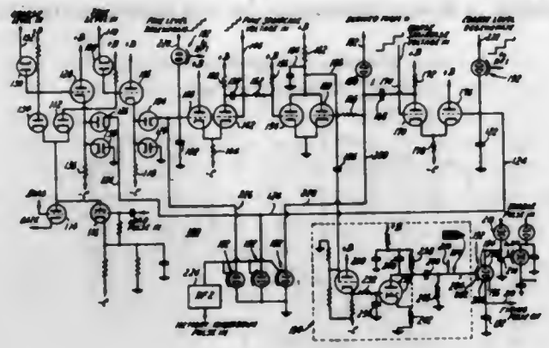
1. In an arc arresting spark gap assembly for lightning arresters of the type wherein the spark gaps are connected in circuit with voltage-dependent resistances and quenching of the arcs in the gaps is effected by an arc produced magnetic field, the combination comprising a plurality of axially stacked cylindrical plates made from insulating material and an electrode piece inserted into each said plate, each said electrode piece being essentially of hairpin shape, the two legs of each electrode piece including an indenture forming a point of arc response and the free ends of the legs being bent back to establish horns, said two legs of each electrode piece being disposed substantially parallel to a diametral axis of the insulator plate and located respectively on opposite sides of the insulator plate in which it is inserted such that each arc gap is established by the indentures of respective legs of electrode pieces inserted in adjacent insulator plates, said legs of all of said electrode pieces having a length substantially exceeding the radius of said cylindrical insulator plates thereby to establish a maximum possible length of arc in each arc gap greater than the circumference of the quenching chamber formed within each adjacent pair of said insulator plates, and all of said arc gaps being located axially one above the other.



3,273,011
TRAVELING FAST-WAVE DEVICE
William C. Brown, Weston, Mass., assignor to Raytheon Company, Lexington, Mass., a corporation of Delaware
Filed Oct. 29, 1962, Ser. No. 233,510
5 Claims. (Cl. 315—39)

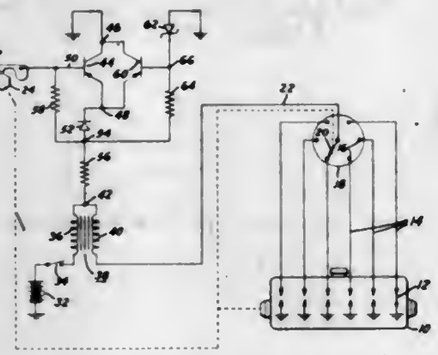
1. A traveling wave device comprising:
an anode structure;
said anode structure having a plurality of parallel axially-extending vanes defining a plurality of uncoupled electromagnetic wave conducting paths arranged side by side;
means communicating with said anode structure for shifting the phase of waves in alternately disposed paths whereby waves in adjacent paths are in opposite phase;

an electron emitting cathode structure coextensive with and surrounding said anode structure defining a substantially continuous interaction space therebetween;
means for establishing a magnetic field directed parallel to the axis of said anode structure and an electric field directed radially to said axis whereby the electrons form a space charge in the interaction space which circulates substantially circumferentially;
means for directing electromagnetic waves along the wave conducting paths in an axial direction to result in phase shifted fringing electric fields between adjacent vanes extending into the interaction space;
said crossed magnetic and electric fields together with said fringing electric fields imparting a phase focusing effect to the electron space charge such that the crossover point of said space charge relative to said traversing waves is in velocity synchronous relationship along a path coaxial to said wave paths whereby said waves are amplified by the net flow of energy from the electron space charge;
and means for launching said amplified waves into space disposed at one end of said device.



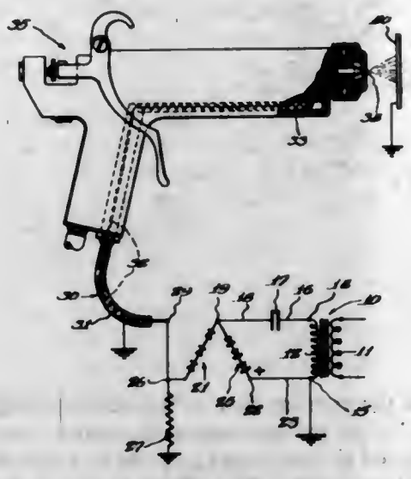
3,273,012
AUTOMATIC HEADLIGHT CONTROL SYSTEM
Irving Rosenblum, Bronx, N.Y., assignor to Dim-O-Matic, Inc., New York, N.Y., a corporation of New York
Filed Nov. 13, 1963, Ser. No. 323,483
4 Claims. (Cl. 315—82)

1. A sealed-beam automobile headlight lamp control for controlling the light output of said headlight comprising,
(a) a parabolic shaped casing,
(b) a source of light carried within and adjacent the rear of said casing,
(c) a lens-shaped transparent glass member forming the frontal part of casing,
(d) a cell-like light sensitive current carrying resistive element structure carried by the glass member and disposed to change its resistivity and corresponding current in response to light intensity variations external to the said casing,
(e) amplifying means carried by the said casing and external thereto for receiving the said current changes responsive to resistive variations of the said cell-like structure,
(f) and means for receiving said amplified current changes and controlling the seal-beam light output.



3,273,013
ELECTRIC SWITCH ARRANGEMENT
Francis H. Shepard, Jr., Lee Lane, Berkley Heights, N.J.
Filed May 19, 1960, Ser. No. 30,216
4 Claims. (Cl. 315—168)

1. An electric switch arrangement comprising an electric circuit adapted to be switched on and off whenever desired, a gas tube connected in series with said circuit, said tube being ionizable and acting substantially as a short-circuit when ionized and as an open-circuit when de-ionized, and generator means for applying to said tube an ionizing high frequency field, said generator means supplying a substantially continuous ionizing field when on and being substantially independent of said electric



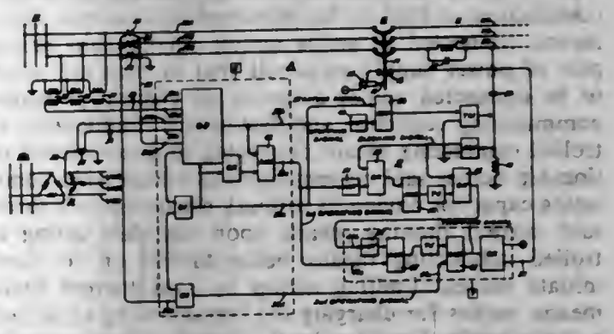
circuit, said generator means giving a gradually decreasing field when turned off so that voltage drop across said tube at the instant of de-ionization is substantially zero.

3,273,014
TRANSISTOR IGNITION SYSTEM HAVING A PROTECTIVE CIRCUIT
Bernard J. Gershen, Edison, N.J., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Jan. 8, 1964, Ser. No. 336,584
5 Claims. (Cl. 315—212)

1. In combination, an internal combustion engine, a plurality of spark plugs for said engine, a source of direct current, an ignition coil having a primary winding and a secondary winding, spark distributing means driven by said engine connected with said spark plugs, means connecting said secondary winding with said spark distributing means, a timing device driven by said engine, a first transistor having emitter, collector and base electrodes, means connecting said primary winding and the emitter and collector electrodes of said first transistor across said source of direct current, means connecting the base electrode of said transistor with said timing device, a second transistor, means connecting the emitter of said second transistor with the emitter of said first transistor, means connecting the collector of said second transistor with the collector of said first transistor, a voltage responsive network connected across the emitter and collector electrodes of said transistors, and means connecting a point on said voltage responsive network with said base electrode of said second transistor, said voltage responsive network including means for biasing said second transistor conductive when a voltage is developed across said emitter and collector electrodes of said first transistor and across said network of a predetermined magnitude and of a polarity to cause current to flow through said first transistor in a forward direction.

3,273,015
ELECTROSTATIC SPRAY GUN SYSTEM
Warren G. Fischer, Elmhurst, Ill., assignor to H. G. Fischer & Co., Franklin Park, Ill., a corporation of Illinois
Filed Apr. 29, 1963, Ser. No. 276,442
2 Claims. (Cl. 317—3)

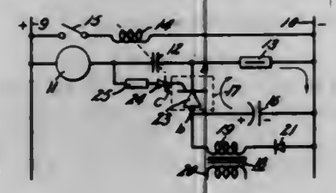
1. In an electrostatic coasting system including a spray gun having a charging electrode for electrically charging coating material discharged by said gun, the combination of a step-up transformer having a primary winding for energization from an alternating current line, said transformer having a secondary winding, a voltage doubling system having two input terminals connected to the two terminals of said secondary winding, said secondary winding having one terminal grounded and the other terminal at high potential and said coating system including a grounded portion comprising the work to be coated, said voltage doubling system including a first capacitor connected between the high potential secondary winding terminal and a first junction point, one rectifier means connected between said first junction point and ground, a second rectifier means connected between said first junction point and a second junction point, said two rectifier means being properly poled for voltage doubling action, a bleeder resistor connected between said second junction point and ground, a coaxial cable having dielectric material between the central conductor and the outer conductor, a direct connection between said outer conductor and ground, a direct connection between one end of said central conductor and said second junction point, the remaining terminal of said central conductor and ground constituting the output terminals of the voltage doubler system, a connection between the remaining terminal of said central conductor and the gun charging electrode, the cable capacitance functioning as a second capacitor in the voltage doubling system whereby a substantial length of cable for manipulation of said gun in connection with coating operations may be used.



3,273,016
POWDER SPRAYERS
Warren G. Buhler, Westfield, N.J., assignor to Oxy-Dry Sprayer Corporation, New York, N.Y., a body corporate
Filed Apr. 23, 1964, Ser. No. 362,107
6 Claims. (Cl. 317—3)

1. In an electrostatic powder sprayer, the combination of
a pair of spaced apart end members;
means defining a powder receptacle between said end members;
a metering mechanism communicating with said receptacle including a dispensing roller having a powder carrying surface journaled between said end members and located within an opening beneath said receptacle, said dispensing roller having a cylindrical surface consisting of a material having a substantial electrical and electrostatic resistance, and
a wiping blade secured to said receptacle and disposed to tangentially engage said roller;

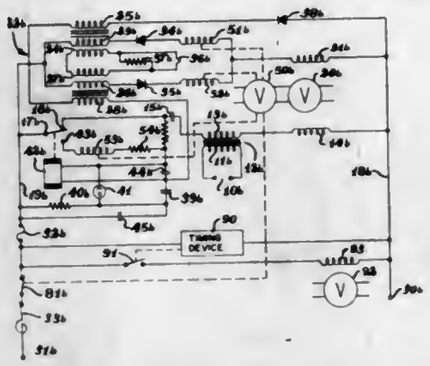
a tubular means for creating an electrostatic field in the vicinity of said dispensing roller to free particles therefrom and to disperse the same; and
means for mounting said tubular means parrallel to said dispensing roller and in the vicinity thereof.



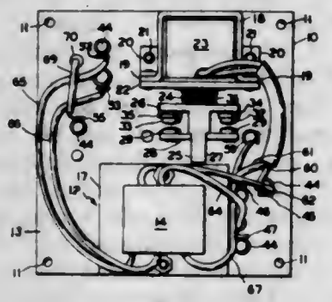
3,273,017
GROUND FAULT RESPONSIVE DIRECTIONAL COMPARISON PROTECTIVE SYSTEM FOR AN ELECTRIC POWER TRANSMISSION LINE
Charles A. Mathews, Springfield, Pa., assignor to General Electric Company, a corporation of New York
Filed Jan. 7, 1963, Ser. No. 249,791
21 Claims. (Cl. 317—18)

1. A directional comparison protective relaying system for initiating a predetermined control function in response to the occurrence of a ground fault on a polyphase A.-C. electric power transmission line having distantly spaced terminals at each of which are located signal transmitting and receiving means so arranged that the transmitting means at each terminal can communicate with the receiving means at any of said terminals remote therefrom, comprising at each of the line terminals:
(a) first ground fault responsive means adapted to be coupled to the line and to the local transmitting means for activating said transmitting means when the magnitude of the zero-phase-sequence component of line current exceeds a predetermined first amount;
(b) ground current directional sensing means connected to the first ground fault responsive means and adapted to be coupled to the line for operation in response to zero-phase-sequence line current of a magnitude exceeding said first amount flowing toward a ground fault located on the protected-line side of the local terminal;
(c) first control means for connecting the ground current directional sensing means to the local transmitting means to deactivate said transmitting means in response to operation of said sensing means;
(d) second ground fault responsive means adapted to be coupled to the line for operation when the magnitude of zero-phase-sequence line current exceeds a predetermined second amount which is greater than said first amount; and

(e) second control means connected to both said sensing means and said second ground fault responsive means and responsive to their contemporaneous operations for effecting initiation of the predetermined control function, said second control means additionally being adapted to be connected to the local receiving means and being so arranged as to be rendered ineffective to initiate said control function whenever said receiving means is receiving a signal from an active remote transmitting means.



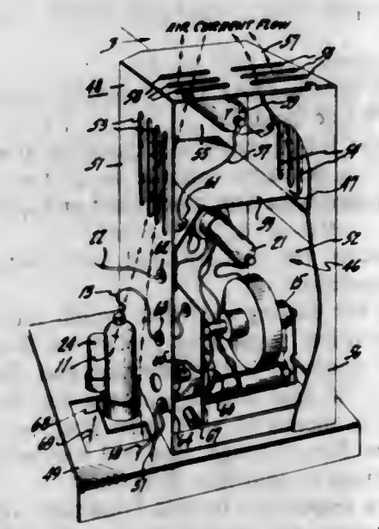
3,273,018
FAST ACTION CURRENT LIMITING CIRCUIT EMPLOYING RELEASE OF STORED ENERGY TO INITIATE CURRENT LIMITING ACTION
Leon Joseph Goldberg, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed Sept. 15, 1964, Ser. No. 397,365
24 Claims. (Cl. 317—20)



1. A fast-action current limiting circuit including in combination a load to be protected and current limiting means connected in series circuit relationship across a pair of power supply terminals that in turn are adapted to be connected across a source of electric potential, a commutating capacitor and fast-acting conductivity controlled conducting means connected in series circuit relationship across said current limiting means, said commutating capacitor having its primary discharge path through said current limiting means upon said fast acting controlled conducting means being turned on to thereby initiate current limiting action by said current limiting means, means for charging the commutating capacitor to a predetermined voltage level, sensing means operatively connected in circuit relationship with the load for sensing load current flow through the load and deriving an output gating signal upon the load current assuming an undesired load current condition, and means operatively coupling the output of said sensing means to the fast-acting conductivity controlled conducting means for causing the fast-acting conducting means to turn on thereby discharging the commutating capacitor through the current limiting means to initiate its current limiting action.

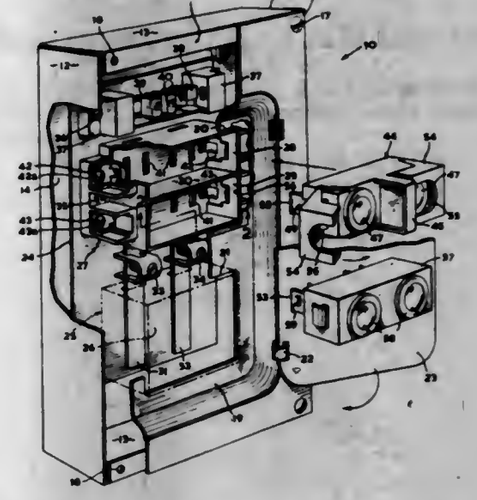
3,273,019
DIRECT SPARK IGNITION SYSTEM
Russell B. Matthews, Oconomowoc, Wis., assignor to Penn Controls, Inc., a corporation of Indiana
Filed Oct. 8, 1963, Ser. No. 314,744
14 Claims. (Cl. 317—86)

1. A spark ignition system comprising:
a spark gap,
energizing means connected to the spark gap to cause a continuously firing alternating current spark to appear across said gap,
a resistance-capacitance circuit connected to said energizing means to limit a period during which said spark gap continuously fires to a preselected value,
actuation means for opening a fuel valve connected to said energizing means for energization only during said spark firing period,
valve holding means,
flame sensing means, and
a magnetic amplifier comprising a pair of magnetic reactors, each said reactor having a load winding, a bias winding, and a control winding, said load windings being connected to said valve holding means, said bias windings being connected to said energizing means in order to have said energizing means increase the current flow in the bias winding after said spark firing period, and said control winding being connected to said sensing means to produce a current in said control winding whose magnetic field opposes a magnetic field of current flowing in said bias windings.



3,273,020
CONTROL APPARATUS
Lloyd H. Murphey, Logansport, Ind., assignor to Essex Wire Corporation, Fort Wayne, Ind., a corporation of Michigan
Filed Oct. 22, 1964, Ser. No. 405,765
3 Claims. (Cl. 317—99)

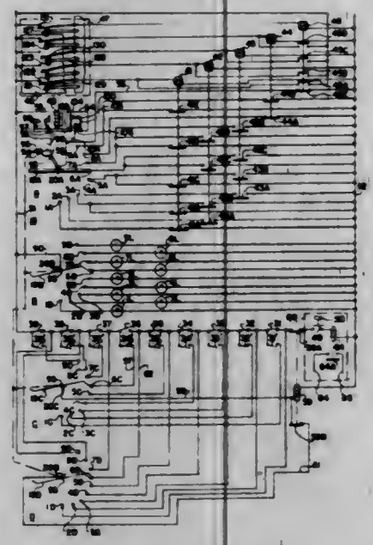
1. Control apparatus for an electric motor driving a refrigerant compressor of an air conditioning unit which is controlled by a thermostatic switch comprising:
(a) an insulating mounting panel having a front surface and a rear surface and provided with an opening therethrough;
(b) an electrical transformer of the type in which a shell-type core partially encloses a coil having portions protruding from two opposite sides of said core, said coil comprising a primary winding having two leads and a low voltage secondary winding having two leads;
(c) means securing the core of said transformer to the rear surface of said panel adjacent said opening with one portion of said coil projecting through said opening and beyond said front surface;
(d) an electromagnet having a coil with two leads and a core-type armature;
(e) means securing said electromagnet upon the rear surface of said panel with the armature axis parallel and close to said rear surface;
(f) a contact carrier of insulating material attached to an exposed end of said armature and carrying a bridging contact means movable with said armature;



(g) first and second brackets secured to said panel in spaced-apart relation and extending above said rear surface of said panel in the path of movement of said bridging contact means;
(h) stationary contacts on said brackets positioned to be engaged by said bridging contact means when the armature is attracted by the electromagnet coil;
(i) first and second terminals secured on the front surface of said panel in electrical connection with said brackets;
(j) third, fourth and fifth terminals secured on the front surface of said panel;
(k) means connecting one lead of said transformer primary winding to said first terminal and means connecting the other lead of said primary winding to said third terminal; and
(l) means connecting one lead of said electromagnet coil to one lead of said transformer secondary winding, means connecting the other lead of said electromagnet coil to said fourth terminal, and means connecting the other lead of said secondary winding to said fifth terminal.

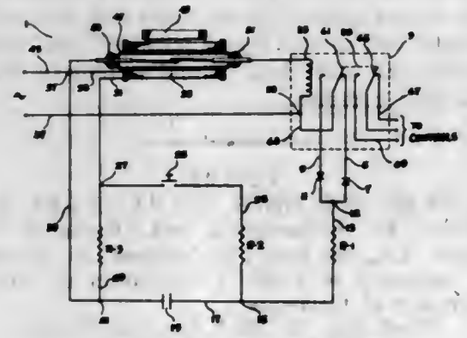
3,273,021
ENCLOSURE FOR HIGH VOLTAGE APPARATUS
John Stark, Jr., Indianapolis, Ind., Bethel E. Denton, Robards, Ky., and James W. McLeod, Jr., Indianapolis, Ind., assignors to Radio Corporation of America, a corporation of Delaware
Filed Aug. 19, 1963, Ser. No. 302,864
4 Claims. (Cl. 317—100)

1. In a television receiver having a substantially horizontal chassis for supporting particular components including a horizontal deflection output tube and transformer, a high voltage rectifier tube connected to said transformer, and a high voltage regulator tube connected to said rectifier tube, said transformer producing only a small amount of heat in normal operation but being subject to damage by high temperatures, said rectifier tube producing only a relatively small amount of heat in normal operation, said output and regulator tubes respectively producing relatively large amounts of heat in normal operation, and said regulator tube also being capable of producing unwanted radiations under abnormal operating conditions,
mounting means for said particular components comprising:
a shelf attached to, and elevated over an opening in, said chassis to mount said output tube in a vertical position so that heat from said tube causes air to be drawn through said opening and raised in temperature, thereby cooling said output tube;
a relatively air-tight metallic compartment mounted on said chassis for enclosing said transformer and said rectifier tube in a combustion-inhibiting environment; and
a ventilated metallic compartment having forward and rear portions, said compartment being disposed above said relatively air-tight compartment for enclosing and mounting said regulator tube on its forward wall,
all of the walls in the forward portion of said ventilated compartment being unbroken to prevent external propagation of any of said unwanted radiations and at least some of the external walls in the rear portion of said ventilated compartment being louvered to conduct air heated by said regulator tube out of said ventilated compartment, thereby cooling said regulator tube, and
one of said louvered walls being positioned relative to said output tube so that the air heated by said output tube is drawn through said ventilated compartment, thereby effectively providing forced ventilation of said ventilated compartment and enhancing the cooling of said output and regulator tubes.



3,273,022
ELECTRICAL LOAD DISTRIBUTION SERVICE CENTRE
Charles E. McRoberts, Toronto, Ontario, Canada, assignor to Amalgamated Electric Corporation, Limited, Toronto, Ontario, Canada
Filed Aug. 5, 1963, Ser. No. 299,749
9 Claims. (Cl. 317—116)

1. An electrical load distribution service centre comprising a housing including a removable panel with at least one opening therein, a neutral busbar and first and second other busbars all electrically insulated from each other and positioned in said housing behind said panel, at least one plug-in receptacle adapted to hold therein two screw-in overcurrent devices threadably engaged within said one receptacle, said receptacle having two first contact means and two second contact means, each of said first contact means being adapted to contact a different one of said first and second busbars when said receptacle is positioned in said housing and being adapted to contact a terminal of a different one of said overcurrent devices when said overcurrent devices are screwed into said receptacle and held therein, each of said second contact means being adapted to contact another terminal of a different one of said overcurrent devices when said overcurrent devices are screwed into said receptacle and held therein, whereby circuits from each of said first and second busbars, through said first contact means, and through said overcurrent devices to said second contact

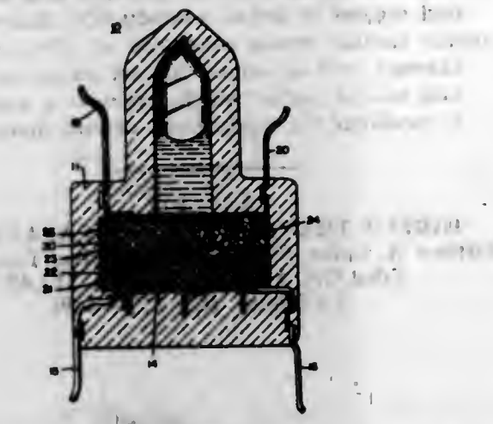


means are established when said receptacle is positioned in said housing and said overcurrent devices are screwed into said receptacle and held therein, and at least two contacts within said housing each adapted to contact a different one of said second contact means when said receptacle is positioned in said housing, the size of the opening in said panel being sufficiently large that said receptacle may be placed in said housing through said opening without removal of said panel and inserted in said housing to an extent sufficient to effect contact between said first and second busbars and said first contact means, means for preventing independent removal of overcurrent devices screwed into said one receptacle and held therein when said one receptacle is positioned in said housing with said first contact means in contact with said first and second busbars, said last-mentioned means comprising flaps mounted on said one receptacle and closable over overcurrent devices screwed into said one receptacle and held therein, and means retaining said flaps in closed position over overcurrent devices screwed into said one receptacle and held therein when said one receptacle is positioned in said housing with said first contact means in contact with said first and second busbars.

3,273,023
SELECTOR CIRCUIT
Henry F. Meyer, Cortland, N.Y., assignor to The Monarch Machine Tool Company, a corporation of Ohio
Continuation of application Ser. No. 90,505, Feb. 20, 1961. This application Sept. 25, 1964, Ser. No. 399,233
11 Claims. (Cl. 317—134)

1. A control circuit comprising, in combination, a controllable device,
a master starter switch,
a plural number of selector switches each having first and second contact means with one thereof being open and the other thereof being closed,
a master switch bank having contacts arranged to correspond to each of said selector switches,
a movable device in said switch bank engageable with the contacts therein to select a predetermined contact position for selecting a desired one of said selector switches,
a power operator for said master starter switch,
means for energizing said master starter switch power operator through the corresponding one of said second contact means and the predetermined contact position of said master switch bank upon the desired selector switch being actuated to open said first contact means and close said second contact means thereof,
means including said master switch bank to establish a shunt circuit around the actuated open first contact means of the actuated selector switch upon the desired selector switch being actuated,
and means for energizing said controllable device through the remaining ones of said first contact means and through said shunt circuit upon the desired selector switch being actuated.

3,273,024
IMPULSE RELAY
Charles A. Sherman, Tacoma, Wash., assignors to Weyerhaeuser Company, Tacoma, Wash., a corporation of Washington
Filed Dec. 11, 1963, Ser. No. 329,725
4 Claims. (Cl. 317—157)

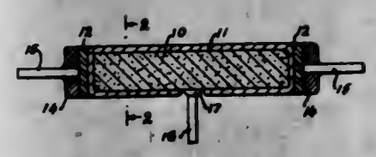


1. An impulse relay apparatus which comprises in combination:
capacitor means,
first means for charging said capacitor means with a charge of one polarity,
second means for charging said capacitor means with a charge of a polarity opposite to said one polarity,
first switch means having an opened and a closed condition,
holding means for holding said first switch in said closed condition,
coil means for biasing said first switch means to said closed position responsive to current flow through said coil means of a first direction and for opposing the force of said holding means for biasing said first switch means to said open position responsive to current flow through said coil means of a direction opposite to said first direction,
relay means responsive to said conditions of said first switch means for switching contact between said capacitor means and said first charging means and between said capacitor means and said second charging means,
second switch means for connecting said coil means to said capacitor means whereby said capacitor means discharges said charges through said coil means to actuate said first switch means to either of said conditions.

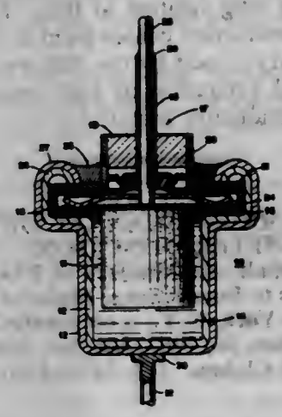
3,273,025
SOLION CELL WITH ELECTRODES ENGAGING CONTAINER WALL FOR PREVENTING ION-DRIFT
Harry R. Broadley, Reading, Mass., assignor to General Electric Company, a corporation of New York
Filed Apr. 1, 1963, Ser. No. 269,662
8 Claims. (Cl. 317—230)

1. An electrical readout integrator comprising a container, a redox electrolytic solution in said container; a plurality of spaced electrodes coaxially arranged within said container comprising a common electrode, a read-out

electrode, an input electrode and a shield electrode; porous insulating means interposed between and contacting said input and shield electrodes for spacing one with respect to the other, said insulating means having two opposed surfaces and an encompassing peripheral surface, said shield electrode being in continuous contact with one of said opposed surfaces and said peripheral surface, a portion of said shield electrode continuously engaging said peripheral surface along a portion of its axial length, the portion of said shield electrode in contact with said peripheral surface also being in contact with the interior surface of said container, said input and shield electrodes and said container defining a reservoir compartment, said electrodes being taken from the class consisting of platinum and its noble metal alloys.



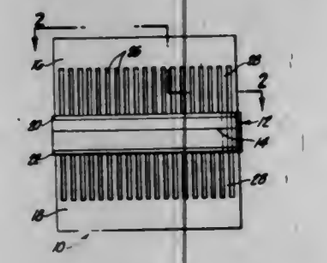
3,273,026
SOLION CELL HAVING ELECTRODES COLD-SEALED WITH CONTAINER WALL
Harry R. Broadley, Reading, Mass., and William R. Grams, Ballston Spa, N.Y., assignors to General Electric Company, a corporation of New York
Filed Apr. 2, 1963, Ser. No. 269,965
17 Claims. (Cl. 317—230)



1. An electrical readout integrator comprising a container, a redox electrolytic solution in said containers; a plurality of spaced electrodes within said container comprising a common electrode, a read-out electrode, an input electrode and a shield electrode; porous insulating means interposed between said input and shield electrodes, said porous insulating means having two opposed surfaces and an encompassing peripheral surface, said shield electrode being disposed on one of said opposed surfaces and at least a portion of said peripheral surface; a conductive cup-shaped element contacting said shield electrode and having a large centrally located aperture in the bottom thereof, said shield electrode and said supporting porous insulating means being firmly wedged into said cup-shaped element to provide a reliable low resistance contact with said shield electrode; first and second conductive leads passing through the wall of said container, said leads being connected to said cup-shaped element and said input electrode to provide externally available connections to said electrodes; and third and fourth conductive leads being connected to said common and read-out electrodes.

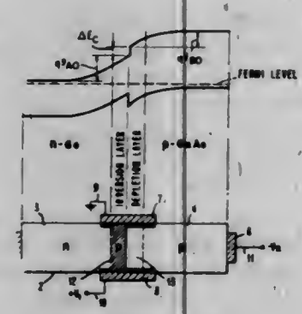
3,273,027
THREE-TERMINAL ELECTROLYTIC DEVICE
Pierre L. Bourgault, Etobicoke, and Jozef Bakalars, Toronto, Ontario, Canada, assignors to Johnson, Matthey & Mallory Limited, Toronto, Ontario, Canada, a corporation of Canada
Filed Sept. 19, 1962, Ser. No. 224,725
12 Claims. (Cl. 317—230)

1. In a device of the character described, the combination comprising an anode of film-forming metal having inter-communicating pores, a continuous dielectric film on the surface of said anode and said pores, a resistive electrolyte covering said film throughout said anode, an anode terminal electrically connected to said anode and insulated from said electrolyte, and a pair of cathode terminals electrically connected to spaced regions of said electrolyte.



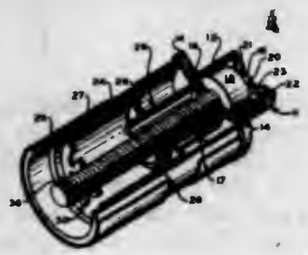
3,273,028
HERMETICALLY SEALED ELECTROLYTIC CAPACITOR
Julian G. Sparkes, Indianapolis, Ind., assignor to P. R. Mallory & Co., Inc., Indianapolis, Ind., a corporation of Delaware
Filed June 27, 1963, Ser. No. 291,189
7 Claims. (Cl. 317—230)

1. In an electrolytic capacitor, a container-shaped cathode having one open end and a shoulder adjacent said end, an electrolyte contained within said cathode, an anode of film-forming metal concentrically disposed within said cathode, a resilient insulating member resting on said shoulder of the cathode, a top member affixed to said anode, and having a nonplanar marginal surface engaging said resilient insulating member providing a seal for said cathode and supporting said anode within said cathode, conductive spring means resting upon said anode top member, a positive terminal assembly comprising an inner tubular member and an outer encircling member separated by a glass-like insulating body fused with said inner and outer members forming a hermetic seal, a positive terminal wire projecting through said inner member and bonded thereto forming a hermetic seal, a



contact washer contiguous with said spring means and affixed to said inner member for anodic contact, an insulating disc separating said contact washer from said outer member, and the open end of said cathode being turned over upon said outer member and comprising said spring means for deforming said resilient insulating member.

3,273,029
METHOD OF ATTACHING LEADS TO A SEMICONDUCTOR BODY AND THE ARTICLE FORMED THEREBY
Bernd Ross, Arcadia, Calif., assignor to Hoffman Electronics Corporation, El Monte, Calif., a corporation of California
Filed Aug. 23, 1963, Ser. No. 304,047
9 Claims. (Cl. 317—234)

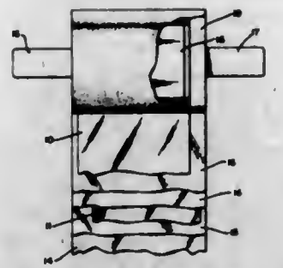


1. A semiconductor device comprising a body of semiconductor material, a pair of electrodes, at least one of said electrodes including a block of electrically conductive material having a coefficient of thermal expansion substantially greater than said semiconductor material, one end of said block having first and second sets of deep channels formed therein, said first set being perpendicular to said second set whereby a plurality of generally parallel, substantially wire-shaped conductors extend from the other end of said block, a layer of solder bonding the ends of said conductors directly to said body, said conductors being sufficiently long relative to their thickness so that heating of said conductors causes them to bow and reduce stress on said body caused by the difference in the coefficients of thermal expansion of said semiconductor material and said conductive material.

3,273,030
MAJORITY CARRIER CHANNEL DEVICE USING HETEROJUNCTIONS
Pieter Balk, Katonah, and Manfred H. Pilkuhn, Mahopac, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 30, 1963, Ser. No. 334,517
10 Claims. (Cl. 317—235)

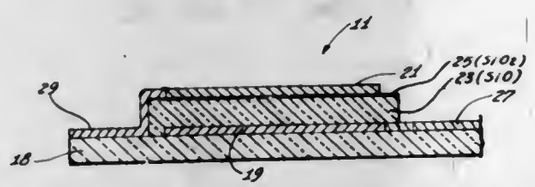
1. A majority carrier channel device comprising:
a monocrystalline semiconductor body having at least two regions, the first region being constituted of a first semiconductor material having a first band gap being of predetermined conductivity-type, and a second region of a second different semiconductor having a band gap greater than said first band gap and being of opposite conductivity-type,
an inversion layer of opposite conductivity type being created at the narrow surface portion of said first region along the interface between said first and second regions to define a conduction channel,
ohmic contact means connected at either end of said channel, and an ohmic contact means connected to said second region which serves as a gate electrode to modulate the conductivity of said channel.

3,273,031
DIRECT TRAVEL TRIMMER CAPACITOR
Matthew A. Lafer, 955 Columbus Drive, Teaneck, N.J.
Filed Oct. 21, 1963, Ser. No. 317,454
7 Claims. (Cl. 317—249)



1. A direct travel trimmer capacitor comprising:
(a) a stationary piston support;
(b) a generally flat drive nut defining a movable piston support;
(c) an adjustment screw in threaded engagement with the movable piston support;
(d) a piston connected to the movable support and slidably engaged with the stationary support;
(e) the stationary support and the piston having a noncircular configuration whereby the piston is restrained from rotation;
(f) the stationary support having a slot;
(g) the movable support having an aperture dimensioned to receive the stationary support with complete clearance;
(h) arms on the movable support dimension to pass through the slot.

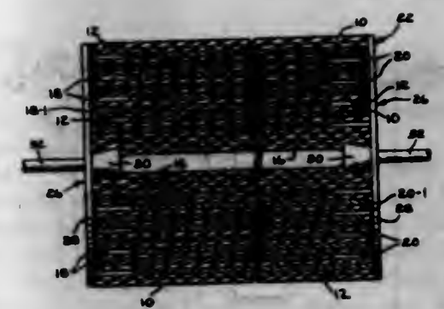
3,273,032
ELECTRICAL CONDENSERS AND METHOD OF MAKING THE SAME
Peter S. Dokuchitz, Unadilla, and Michael Milkowski, Sidney, N.Y., assignors to The Bendix Corporation, a corporation of Delaware
Filed Jan. 19, 1960, Ser. No. 3,433
11 Claims. (Cl. 317—258)



1. An electrical condenser comprising a plurality of tightly stacked superimposed layers of sheet metal, at least one layer of insulating sheet material interposed between each successive pair of metal layers, means electrically connecting alternate metal layers tgoether, and a solid insulating compound filling the spaces between said metal and insulating layers, the insulating compound consisting predominantly of a refractory oxygen compound of boron deposited in situ, the insulating compound impregnating the insulating layers, bonding the layers of the condenser together, and retaining such layers in tightly stacked condition.

5. The method of making an electrical condenser which includes superimposing alternate layers of sheet metal with at least one layer of sheet insulating material interposed between successive layers of sheet metal, substantially completely enclosing the broad surfaces of the thus assembled layers in at least one layer of covering material so as to leave at least an end of the stack uncovered, subjecting the thus covered stack to compression to retain the layers thereof in tight contact, immersing the thus covered and compressed stack in an impregnating bath consisting largely of a solution of an inorganic glass-

forming material in a vehicle, heating the bath while the stack is thus immersed therein, leaving the stack in the bath for a sufficient length of time for the solution to penetrate completely into the stack, withdrawing the stack from the bath, and while the stack is still confined and under compression heating the stack so as to volatilize and drive off the vehicle and to decompose the solid material deposited from the solution to form an inorganic glass dielectric within the condenser which binds the layers of the stack together.

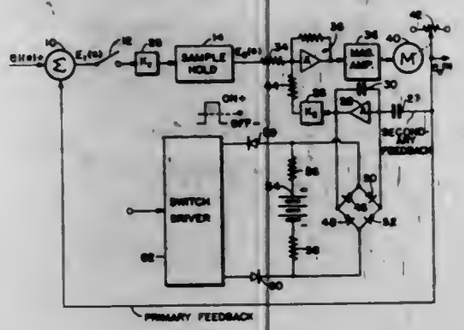


3,273,033
MULTIDIELECTRIC THIN FILM CAPACITORS
Richard Alan Rossmeisl, Woodland Hills, Calif., assignor to Litton Systems, Inc., Woodland Hills, California
Filed Aug. 29, 1963, Ser. No. 305,352
5 Claims. (Cl. 317—258)

2. A capacitor deposited on a thin film circuit substrate comprising a pair of substantially parallel metallic plates, and a dielectric interposed between said plates, said dielectric including a first film of vapor deposited material having a selected low evaporation temperature and a selected dielectric constant to impart a predetermined capacitance to the capacitor, and a second film of vapor deposited material having a selected evaporation temperature substantially higher than that of said first film and a leakage characteristic substantially lower than the leakage characteristic of said first film and being approximately one-seventh the thickness of the first film of vapor deposited material.

5. A method for fabricating thin film circuit capacitors having a selected low leakage characteristic and a predetermined thickness comprising the steps of depositing a first metallic thin film on a thin glass substrate, vapor depositing a first thin film layer of a first dielectric material having characteristics selected to furnish a predetermined dielectric constant to a selected thickness on said first metallic film, vapor depositing a second thin film layer of a second dielectric material having a leakage characteristic substantially lower than that of said first dielectric material to a thickness of approximately one-seventh or less that of said first layer, and depositing a second metallic thin film to cover said film of second dielectric material.

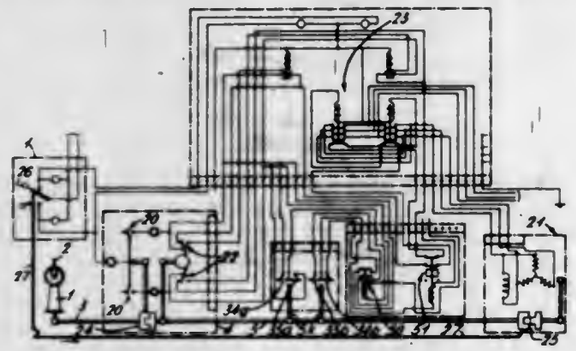
3,273,034
EXTENDED FOIL CAPACITOR WITH DISC-LIKE TERMINALS CENTRALLY ANCHORED THERETO AND A METHOD OF MAKING THE SAME
George P. McGraw, Jr., Downers Grove, Ill., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed Feb. 24, 1965, Ser. No. 435,093
5 Claims. (Cl. 317—260)



1. A capacitor comprising:
a pair of foils of tin alloy and a pair of thermoplastic dielectric webs convolutely arranged in a roll with the foils interleaved with and supported by the dielectric webs in insulated, superposed and in partially overlapping relation to one another and with a marginal portion of one of the foils extending beyond and compressed against the dielectric webs at one end of the capacitor roll, and with a marginal portion of the other foil extending beyond and compressed against the dielectric webs at the other end of the capacitor roll, and with the leading end portions of said dielectric webs extending beyond the leading ends of the foils and forming a tubular core; and
terminals for the foils, each terminal comprising a flat disc portion bonded to the compressed marginal portion of the foil along the entire length thereof at one end of the capacitor roll, and a hub portion with a reduced neck and an enlarged end of greater diameter than the bore of said tubular core extending centrally from one side of said disc portion and embedded in and anchored to an end portion of said core.

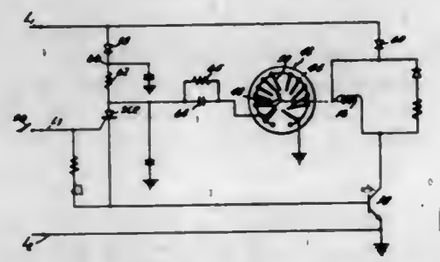
4. A method of making a capacitor which comprises:
forming a tubular thermoplastic dielectric core;
winding a pair of dielectric webs having a width coextensive with the core, and a pair of foils of tin alloy around the core to form a capacitor roll with the foils supported by the webs in insulated, superposed and partially overlapping relation to each other and with a marginal portion of one of the foils extending beyond the core and the webs at one end of the capacitor roll and with the marginal portion of the other foil extending beyond the core and the webs at the other end of the roll;
forming a terminal having a flat disc portion with a central flared hub extending from one side thereof;
heating a pair of such terminals to a temperature sufficient to melt the foils and the thermoplastic core; and
compressing the extended portions of the foils against the webs at the ends of the capacitor roll with the heated terminals and bonding the flat disc portions of the terminals to the marginal portions of the

foils along the entire length thereof, and simultaneously therewith, embedding the hubs of the terminals in the ends of the core.



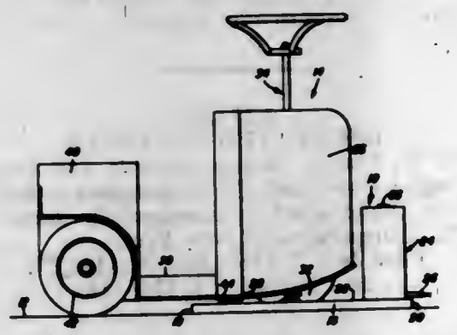
3,273,035
SYSTEM OF STABILIZATION FOR A SAMPLE-DATA SERVO USING A VARIABLE GAIN SAMPLED-DATA LOOP AND A PROPORTIONAL LOOP
John A. Inderbees, Cincinnati, Ohio, assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed Nov. 27, 1963, Ser. No. 326,335
6 Claims. (Cl. 318—18)

1. In a sampled-data servo system including a source of input variable signals, a summer having first and second inputs and an output, said first input being supplied with said input variable signals from said source, sampling means for sampling the output of said summer, a sample-hold circuit for holding said sampled signal in the interval between samplings to produce a sample-hold output signal, a controller for producing an output signal, said controller having an input and an output, said input being supplied with said sample-hold output signal, and a primary negative feedback path from the output of said controller to said second input of said summer to establish a closed primary servo loop, the improvement comprising:
- a second summer interposed between said sample-hold circuit and said controller, said summer having one input supplied from the output of said sample-hold circuit and having a second input supplied from a secondary negative feedback path connected from the output of said controller, said secondary feedback establishing a secondary loop, said secondary negative feedback path including means for producing a feedback variable proportional to the change in said output variable signals during intervals between input samples, whereby said secondary feedback loop effectively maintains a closed loop servo in the intervals between samples;
- and first adjustable gain control means in said primary loop, and second adjustable gain control means in said secondary loop, said means being adjustable to provide equal gains in said loops.



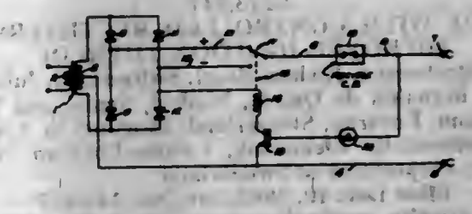
3,273,036
REMOTE CONTROL APPARATUS
Herbert John Goodwin, Ealing, London, England, assignor to Bloctube Controls Limited, Aylesbury, England, a British company
Filed Apr. 23, 1964, Ser. No. 362,021
Claims priority, application Great Britain, May 7, 1963, 18,039/63
3 Claims. (Cl. 318—31)

1. Remote control apparatus comprising a manually operable control handle movable selectively from a neutral position to positions for drive in opposite senses, a first system control shafting extending between said handle and the controls for a prime mover and a transmission gear, said transmission gear driving a second system shafting to a propeller, an electric motor means having clutch means connected to said first system, said clutch means responsive to movement of said handle to either of its drive positions, to transmit movement to members of said control shafting and to said prime mover, transmission gear and said propeller shafting, said members being free to move independently of but correspondingly to the movement of said control handle, means driven by said elec-



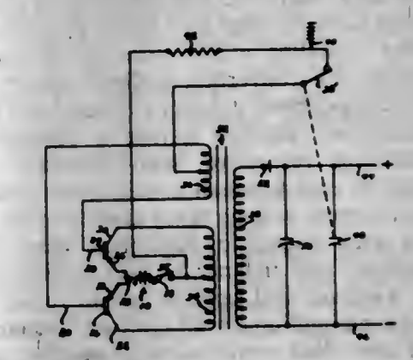
tric motor means with said members of said control shafting for actuating a time delay mechanism after the movement of said control handle from its position for drive in the one sense through its neutral position to its position for drive in the opposite sense, said time delay mechanism comprising means to interrupt the operation of the motor means for a predetermined period of time, and braking means acting on said propeller shafting during said predetermined period for reducing the speed of said prime mover during said motor interruption.

3,273,037
CONTROL CIRCUIT
Bernard J. Winestock, Los Angeles, and Jack D. Sinable, Rolling Hills Estate, Calif., assignors to Controls Company of America, Melrose Park, Ill., a corporation of Delaware
Filed Oct. 21, 1963, Ser. No. 317,666
11 Claims. (Cl. 318—467)



1. In a solenoid-type step drive including a coil, a rotor movable from a rest position through a predetermined angular step when said coil is energized, and means biasing said rotor to said rest position and operative to return said rotor to said rest position when said coil is de-energized; the combination with said coil of,
- a transistor connected in circuit with and controlling current flow through said coil,
- a silicon control rectifier in the base circuit of said transistor and normally in a non-conductive state so that said transistor is non-conductive and said coil is de-energized,
- electrical power supply means connected to and applying a voltage to said silicon control rectifier,
- switch means connected in said circuit with said silicon control rectifier on the input side thereof and having said voltage impressed thereon, said switch means comprising a plurality of relatively spaced grounded contacts and a switch arm movable between said contacts to alternately make and break a circuit from the input side of said silicon control rectifier to ground, said arm normally in engagement with one of said contacts when said silicon control rectifier is non-conductive,
- means for applying a switch-over pulse of relatively short duration to said silicon control rectifier to render it conductive to change the operational state of said transistor and energize said coil to initiate movement of said rotor,
- and means responsive to energization of said coil and operative, concurrently with rendering said silicon control rectifier conductive, to move said switch arm between said contacts and open said circuit to ground so that a voltage at least equal to the maintaining voltage of said silicon control rectifier is applied to said silicon control rectifier and said silicon control rectifier remains conductive until said switch arm reengages one of said contacts to remove at least a portion of the maintaining voltage from said silicon control rectifier to render said silicon control rectifier nonconductive and de-energize said coil, whereby said angular step is determined by movement of said switch arm between contacts and not by the duration of said pulse.

3,273,038
BATTERY RECHARGING METHOD AND APPARATUS FOR ELECTRICALLY POWERED VEHICLES
Walter D. Miller, % Mt. Jefferson Lumber Co., Lyons, Oreg.
Filed Apr. 8, 1963, Ser. No. 271,101
4 Claims. (Cl. 320—2)

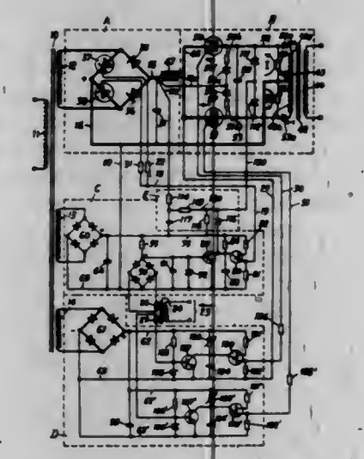


1. In combination with an electrically-powered wheel-supported vehicle having a dirigible wheel and a rechargeable battery source of power, a battery recharging apparatus comprising a platform having guiding means thereon for receiving a vehicle wheel rolled onto said platform and then positioning the wheel thus to define a charging station for the vehicle, said guiding means having an elongated trough formed in the platform for guiding movement of said dirigible wheel and a circular depression formed in the platform at a forward end of the trough permitting angular displacement of said dirigible wheel with the vehicle in said charging station, charging circuit means mounted on said platform in spaced relation to the guiding means for providing charging current for the battery source of power of the vehicle, contact means mounted on said platform in fixed relation to said guiding means for engagement with the vehicle to establish electrical contact between the battery source of power and said charging circuit means, said vehicle having contact elements connected to the battery source of power and exposed below the vehicle for engagement by the contact means, and means operatively mounted on the platform operative in response to forward movement of the vehicle onto the platform into said charging station for rendering the charging circuit means operative.

3,273,039
POLARITY CORRECTING CIRCUITS
James B. Godshalk, West Pikeland Township, Chester County, and Lewis A. Medlar, Lansdale, Pa., assignors to Fox Products Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Apr. 24, 1963, Ser. No. 275,267
7 Claims. (Cl. 320—26)

1. In a circuit for connecting a battery to a battery charger with the proper polarity, the combination of
- a pair of leads connectable to the terminals of a battery to be charged;
- a source of charging current for normally applying charging potential of one polarity to said leads, said source having two output conductors and a common conductor, said two output conductors providing charging potential of opposite polarity with respect to a common conductor, one of said leads being connected to said common conductor and the other of said leads being selectively connected to one of the remaining conductors;
- polarity responsive circuit means connected between said leads and operative to reverse the polarity of potential applied by said source to said leads, said polarity responsive circuit means including
  - a relay having an actuating winding and contacts so arranged that said source is connected to said leads to provide potential of one polarity when said actuating winding is not energized, and of the opposite polarity when said actuating winding is energized, and
  - a transistor having three electrodes, one said electrode being connected to said actuating winding of said relay and being operative to energize said actuating winding when energized, said other electrodes being connected between said leads so as to become conductive whenever a battery is connected to said leads with said opposite polarity.

3,273,040
REGULATED CONVERSION SYSTEM
Donald H. Schuster, 548 Forest Drive SE., Cedar Rapids, Iowa
Filed July 16, 1962, Ser. No. 210,039
10 Claims. (Cl. 321—2)



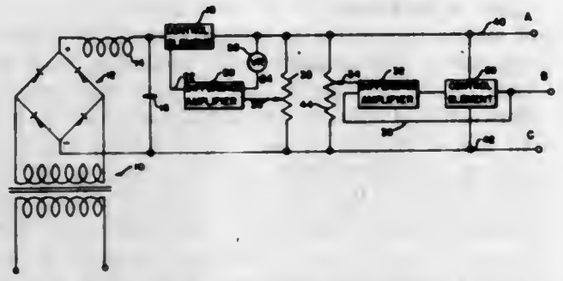
10. In a transistor regulated conversion circuit, comprising,
- a transistor inverter circuit having a bias circuit and an output circuit, and a switch in said bias circuit,

and an electrostrictive capacitor connected across the output of said output circuit, said electrostrictive capacitor operatively connected to said bias circuit switch to open and close said bias circuit as the output voltage across said electrostrictive capacitor moves above and below a predetermined valve.

3,273,041
CIRCUIT WITH CONTROLLED RECTIFIERS AND IMPROVED IGNITION THEREOF

Walter Strohmeier, Rieben, Basel, Switzerland, Julio Gonzales Bernaldo de Quiros, Madrid, Spain, and Werner Ullmann, Locarno, Switzerland, assignors to Agie A.G. fur industrielle Elektronik, Losone-Locarno, Switzerland, a corporation of Switzerland

Filed Dec. 10, 1962, Ser. No. 243,457
Claims priority, application Switzerland, Dec. 13, 1961, 14,453/61
5 Claims. (Cl. 321—4)

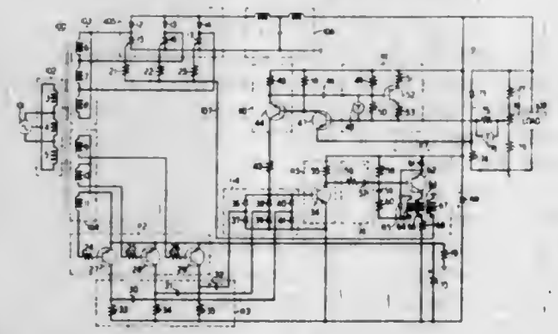


3. An electric circuit provided with controlled semiconductor rectifier means, ignition circuit means for igniting said controlled semi-conductor rectifier means, said ignition circuit means delivering a series of ignition impulses at least during a predetermined ignition period, said electric circuit including a full-wave rectifier provided with four rectifiers connected in a full-wave bridge rectification circuit, two of said rectifiers including said controlled semi-conductor rectifier means and electrically connected to a common terminal of a direct-current voltage outlet of said full-wave rectifier, said ignition circuit means including a first ignition circuit electrically connected with said two controlled semi-conductor rectifier means for delivering an uninterrupted series of said ignition impulses, the pulse repetition frequency of which lies at least above the frequency of an alternating-current voltage to be rectified by a factor of 3, said electric circuit further including a direct-current to alternating-current inverter for converting a direct-current voltage into an alternating-current voltage, a transformer provided with a transformer winding having a center-tap, said inverter including respective semi-conductor rectifier means coupled to each terminal of said transformer winding, the direct current voltage being applied to said center-tap and via said respective controlled semi-conductor rectifier means of said inverter to said terminals of said transformer winding, said ignition circuit means further including a second ignition circuit electrically coupled with both of said controlled semi-conductor rectifier means of said inverter for alternatingly supplying said series of ignition impulses, wherein the alternation in the transmission of said series of impulses corresponds to the desired frequency of the output alternating-current voltage.

3,273,042
DUAL OUTPUT POWER SUPPLY FOR TRANSISTOR CIRCUITS

Alfons A. Tuszynski, Buffalo, N.Y., assignor, by mesne assignments, to Esterline-Angus Instrument Company, Inc., Indianapolis, Ind., a corporation of Delaware

Filed Aug. 9, 1962, Ser. No. 215,917
6 Claims. (Cl. 321—16)

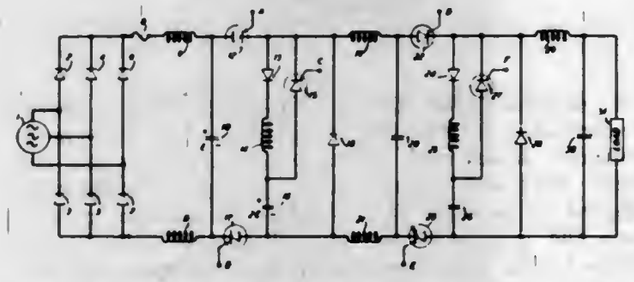


1. A dual output power supply comprising,
a full wave rectifier including terminals adapted for connection to a source and having a main output,
control means for varying the voltage of said output,
a source of fixed reference potential,
differential amplifier means connected to said reference potential and to said output and to said control means and affecting said control means to establish the potential of said main output,
second control means, said second control means being connected across said established main output to split the voltage thereof to provide a secondary output,
and second differential amplifier means connected to said secondary output and to said established main output to establish the potential of said secondary output.

3,273,043
REGULATED RECTIFIER

Patrick W. Clarke, Jackson Heights, and Joseph A. Pirraglia, New York, N.Y., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed July 2, 1962, Ser. No. 206,571
16 Claims. (Cl. 321—18)



16. A three-phase power supply comprising first, second and third controlled rectifiers each having anode, cathode and gate electrodes, a source of alternating-current potential having a first, second, and third phase, a load, means for serially individually connecting the anode and cathode electrodes of each of said first, second, and third controlled rectifiers between each of said first, second and third phases of said alternating-current source and said load respectively, first, second, third, and fourth transistors each having base, collector and emitter electrodes, first, second and third capacitors, first, second, third, fourth, fifth, and sixth asymmetrically conducting devices, means for coupling the base and emitter electrodes of each of said first, second, and third transistors

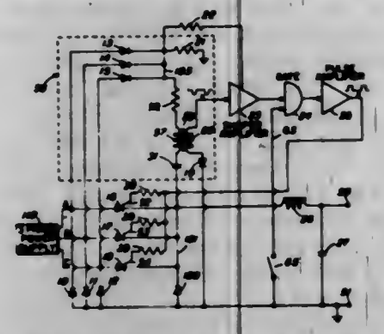
to each of said first, second, and third phases of said alternating-current source respectively, means for serially connecting in individual paths the collector electrodes of each of said first, second, and third transistors, said first, second, and third capacitors, said first, second, and third asymmetrically conducting devices and the base electrode of said fourth transistor, respectively, means for controlling the storage rate of said first, second, and third capacitors comprising a variable impedance serially connecting each of said first, second and third capacitors to said load, a source of reference potential, means responsive to the difference between the voltage appearing across said load and said reference potential for controlling said impedance element, inverting means, means responsive to parasitic variations in said energy storage rate of each of said first, second and third capacitors, means for connecting said parasitic variation responsive means to said inverting means, means for connecting said inverting means to said load voltage reference-potential difference responsive means, means for connecting said impedance means to the base electrode of said fourth transistor, first, second and third resistors, means for serially connecting in individual discharge paths said first, second and third capacitors, said first, second and third resistors and said fourth, fifth and sixth asymmetrically conducting devices, means including said first, second and third resistors, respectively, for connecting the emitter electrode of said fourth transistor to the collector electrodes of said first, second and third transistors, a differentiating network, means for connecting the collector electrode of said fourth transistor to said differentiating network, a blocking oscillator, means for connecting said blocking oscillator to said differentiating network, and means for connecting the output of said blocking oscillator to the gate electrodes of each of said first, second, and third controlled rectifiers whereby the state of conduction of each of said first, second and third controlled rectifiers is controlled in accordance with said alternating-current source and load voltage variations.

3,273,044
TRANSFORMER REPLACEMENT SYSTEM

Patrick W. Clarke, Murray Hill, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Dec. 19, 1962, Ser. No. 245,817
4 Claims. (Cl. 321—18)

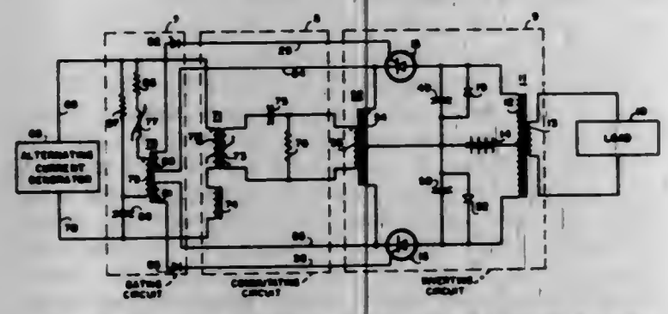
3. A transformerless rectifier regulating system having first and second terminals, first, second, third, fourth, fifth, and sixth controlled rectifiers, each having anode, cathode, and gate electrodes, first, second, third, fourth, fifth, sixth, seventh, eighth, ninth, tenth, eleventh, and twelfth energy storage means, first, second, third, fourth, fifth, sixth, seventh, eighth, ninth, and tenth asymmetrically conducting devices, a source of alternating current having first, second, and third phases, a load, means for serially connecting said first and second asymmetrically conducting devices between said first and second input terminals, means for serially connecting said third and fourth asymmetrically conducting devices between said first and second input terminals, means for serially connecting said fifth and sixth asymmetrically conducting devices between said first and second input terminals, means for connecting said first phase of said source of alternating current to said first and second asymmetrically conducting devices, means for connecting said second phase of said source of alternating current to said third and fourth asymmetrically conducting devices, means for connecting said third phase of said source of alternating current to said fifth and sixth asymmetrically conducting devices, means for serially connecting said first input terminal, said first energy storage means, said second energy storage means, said third energy storage means, and said second input terminal, means for serially connecting said first input terminal, said first energy storage means, the anode-cathode electrodes of said first controlled rectifier, said fourth energy storage means, the anode-cathode electrodes of said second controlled rectifier, said fifth energy storage means, said load, the anode-cathode electrodes of said third controlled rectifier, said sixth energy storage means, the anode-cathode electrodes of said fourth controlled rectifier, said third storage means and said second input terminal, means for serially connecting the cathode electrode of said first controlled rectifier, said seventh asymmetrically conducting device, said seventh energy storage means, said eighth energy storage means, and the anode electrode of said fourth controlled rectifier, means for connecting the anode electrode of said fifth controlled rectifier to said seventh and eighth energy storage means, means for connecting the cathode electrode of said fifth controlled rectifier to the cathode electrode of said first controlled rectifier, means for connecting said eighth asymmetrically conducting device between the anode electrode of said fourth controlled rectifier and the cathode electrode of said first controlled rectifier, means for connecting said ninth energy storage means between the cathode electrode of said third controlled rectifier and the anode electrode of said second controlled rectifier, means for serially connecting the cathode electrode of said second controlled rectifier, said ninth asymmetrically conducting device, said tenth energy storage means, said eleventh energy storage means and the anode electrode of said third controlled rectifier, means for connecting the anode electrode of said sixth controlled rectifier to said tenth and eleventh energy storage means, means for connecting the cathode electrode of said sixth controlled rectifier to the cathode electrode of said second controlled rectifier, means for connecting said tenth asymmetrically conducting device between the anode electrode of said third controlled rectifier and the cathode electrode of said second controlled rectifier, means for connecting said twelfth energy storage means across said load, gating means connected to the gate electrodes of each of said first, second, third, and fourth controlled rectifiers to initiate the conductive condition of said controlled rectifiers at fixed equal intervals, said first and fourth controlled rectifiers being conductive at intervals alternate to the intervals that said second and third controlled rectifiers are conductive, means responsive to load voltage variations connected to the gate electrodes of said fifth and sixth controlled rectifiers to control the conductivity of said fifth and sixth controlled rectifiers to extinguish the conductivity of said first and fourth and second and third controlled rectifiers, respectively, to obtain voltage regulation.



3,273,045
CIRCUIT FOR SYNCHRONIZING FIRING OF DIODES IN DIODE-CONTROLLED RECTIFIER

Albert J. Benson, Huntington Beach, Calif., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

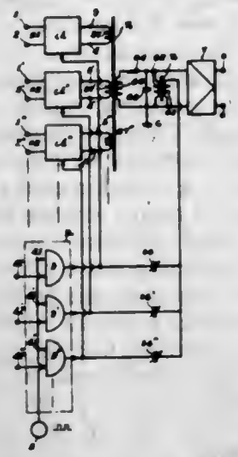
Filed July 11, 1962, Ser. No. 208,997
12 Claims. (Cl. 321—43)



1. Rectifying means for rectifying a three-phase signal source having an output terminal for each phase, comprising three controlled rectifier means each including a

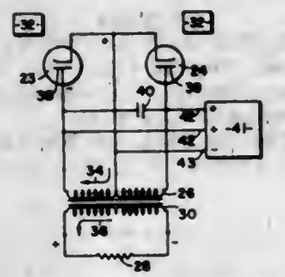
first anode, a first cathode and a control electrode, individual ones of said anodes being connected to an individual one of said three output terminals of said three-phase signal source, said cathodes having a first common terminal, three unilateral impedance means, each having anode means and cathode means, said unilateral impedance anode means being individually connected to individual ones of said three output terminals, said unilateral

impedance cathode means having a second common terminal, pulse forming means responsive to sudden changes in potential between said first and second common terminals to produce corresponding output pulses, means for supplying said output pulses to the said control electrodes of said three controlled rectifiers to fire the particular rectifier whose anode potential is then greater than its cathode potential.



3,273,046
INVERTER CIRCUITS WITH INDEPENDENT COMMUTATION CIRCUITS
Burnice D. Bedford, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed May 8, 1961, Ser. No. 108,414
14 Claims. (Cl. 321—45)

2. An inverter supplying a reactive load from a direct current source, comprising, a pair of controlled rectifiers connected to conduct current in alternate directions through said load, a source of periodic signals, means responsive to said periodic signals to alternately render said controlled rectifiers conductive, commutating means responsive to said periodic signals operative to render said controlled rectifiers nonconductive a determinable time after conduction is initiated therein, an unidirectional current conducting means connected to provide a low impedance path for current due to electromotive forces generated within said load.

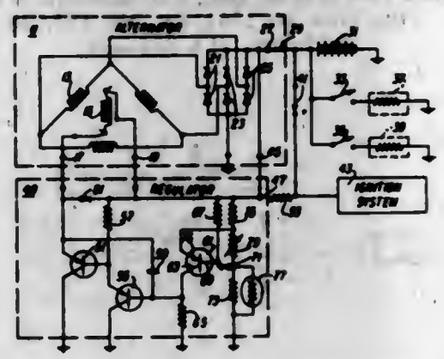


3,273,047
ELECTRICAL SIGNAL SWITCHING DEVICE
Tsuyoshi Takafuji, Musashino-shi, Tokyo, Japan, assignor to Kabushikikaisha Yokogawa Denki Seisakusho (Yokogawa Electric Works Ltd.), Tokyo, Japan, a corporation of Japan
Filed Apr. 2, 1963, Ser. No. 270,062
Claims priority, application Japan, Apr. 10, 1962, 37/14,301
3 Claims. (Cl. 321—48)

1. An electrical signal switching device comprising an output transformer composed of a plurality of primary coils and a secondary coil wound on the same core, a plurality of signal transmission lines respectively terminated with the primary coils of said transformer, a plurality of chopper circuits respectively inserted between said transmisison lines and respective primary coils of said transformer, and a plurality of gate circuits connected

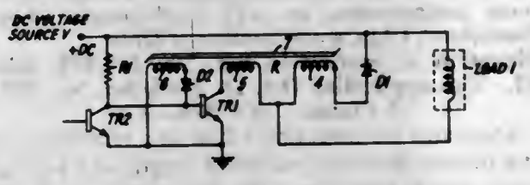
respectively to said chopper circuits for supplying driving signals thereto, said gate circuits being selectively operated by selective command signals so that said chopper circuits are successively operated by said driving signals from said gate circuits, thereby converting respective input signals applied to said chopper circuits into alternating current signals successively.

3,273,048
THERMIONIC DIODE CONVERTER SYSTEM
Rodney G. Hoff, Eugene V. Clark, Jr., and Charles C. Weeks, Canoga Park, Calif., assignors to North American Aviation, Inc.
Filed Sept. 14, 1962, Ser. No. 223,765
16 Claims. (Cl. 322—2)



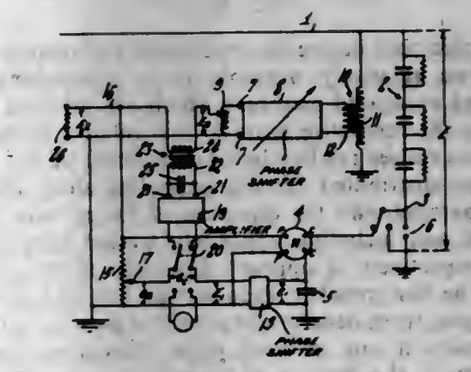
1. Apparatus for directly converting thermal energy to alternating current comprising a pair of thermal energy converter diodes each having a set of emitter and collector electrodes connected in push-pull arrangement adapted to generate D.C. voltages of opposite polarity upon the application of thermal energy, each of said diodes having a first and second mode of operation, load means operatively connected to said push-pull arrangement, and means cooperating with said diodes for alternately switching the mode of operation of said diodes between said first and second modes of operation so that the direct current output of each of said diodes is alternately connected to said load.

3,273,049
VOLTAGE REGULATOR
Charles L. Shano, Morton Grove, Ill., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois
Filed Feb. 14, 1963, Ser. No. 258,484
6 Claims. (Cl. 322—28)



1. A voltage regulator for a vehicular electrical system having an electromechanical source of direct current with

a field winding therein, said source of direct current being connected to a reference potential and providing an output voltage with respect thereto, said regulator including in combination, means for connecting one end of the field winding to the source of direct current, a first transistor having an emitter electrode connected to the other end of the field winding and a collector electrode connected to the reference potential to complete an energizing circuit for the field winding, an emitter loaded second transistor coupled to said first transistor to cut off same when said second transistor is cut off, and a third transistor coupled to said second transistor and conductive to provide cut off bias thereto, said third transistor having base,



emitter and collector electrodes, a first resistor for connecting said emitter electrode of said third transistor to the source of direct current, a second resistor for connecting said base electrode of said third transistor to the source of direct current, a zener diode connected between said base electrode of said third transistor and the reference potential, said zener diode being poled to conduct in reverse direction from said base electrode to the reference potential, a third resistor coupling said emitter electrode of said third transistor to the reference potential so that when said zener diode is not broken down said first resistor will reverse bias said third transistor, and so that when said zener diode is broken down for reverse conduction said third transistor will be forward biased.

3,273,050
POWER SWITCHING AND REGULATING CIRCUITS
Aloysius W. Pratt, New Carlisle, Ohio, assignor to American Machine & Foundry Company, a corporation of New Jersey
Filed July 22, 1963, Ser. No. 296,772
20 Claims. (Cl. 322—28)

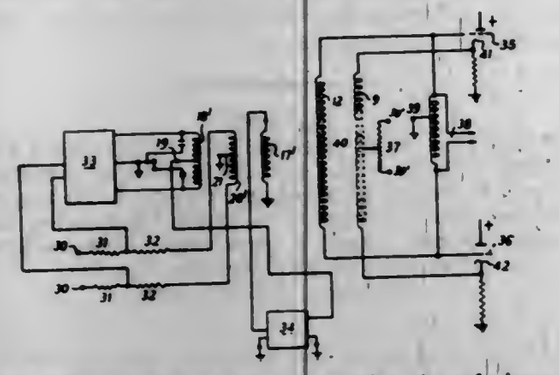
1. A switching circuit for providing power control of a highly inductive load, comprising a source of direct current potential, a saturable reactor having a plurality of windings, said load and a first one of said windings being serially connected across said source, said reactor being saturated in a first direction, a switching amplifier connected in series with said load and said first winding, activating means connected to said source of direct current potential and said switching amplifier and operative to cause said amplifier to conduct and allow current to flow through said load and said serially connected first winding, the current in said first winding being operative to cause said reactor to saturate in a second direction, means operative in response to said reactor saturation in said second direction to cause said amplifier to cease to conduct, a second winding of said reactor and an asymmetric impedance connected in series across said load, said second winding and said impedance being operative when said reactor saturates in said second direction to provide a conductive path for the load current and allow that current to restore said reactor to a saturation state in said first direction, and means for selectively actuating said switching amplifier activating means.

3,273,051
APPARATUS FOR DERIVING LOW VOLTAGES FROM A HIGH VOLTAGE ELECTRICAL SYSTEM
Edmund H. Povey, Medford, and Chester L. Dawes, Winchester, Mass., assignors to Doble Engineering Company, Belmont, Mass., a corporation of Massachusetts
Filed Nov. 19, 1962, Ser. No. 238,590
4 Claims. (Cl. 323—45)

1. Apparatus for establishing and maintaining a low output voltage in a fixed ratio to and in phase with a high voltage comprising a first impedance device of known power characteristics connected to said high voltage, a low voltage source that provides an output voltage of the same frequency as said high voltage and a phase relatively close to that of said high voltage,

first control means coupled to said high voltage including phase shifting and magnitude adjusting means for providing a first reference voltage in fixed magnitude and phase relation to said high voltage,

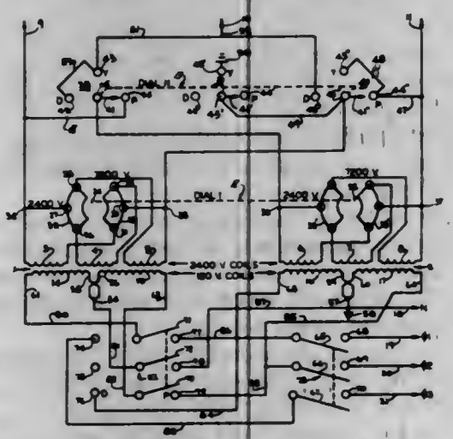
second control means coupled to said low voltage source including means for varying the magnitude and shifting the phase of said output voltage for providing a second reference voltage that is a fraction of said output voltage,



a phase sensitive device coupled to said first impedance device and to said low voltage source for providing an indication of the phase difference between said output voltage and the output of said first impedance device for controlling the adjustment of said first control means to establish said first reference voltage in phase with and in predetermined magnitude relation to said high voltage,

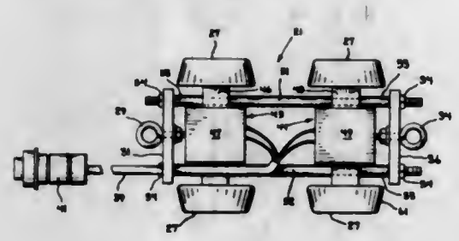
linear amplifying means having an input stage, an output stage, and negative feedback between said input and output stages,

means for applying the difference between said first reference voltage and said second reference voltage to said amplifying means to generate a correction voltage, the power of which is a small fraction of the power of said output voltage,



and a transformer connected between the output of said amplifying means and said second control means for inductively combining said correction voltage with said output voltage in an addition operation to provide and maintain a continually compensated low output voltage in a given fixed ratio to and in phase with said high voltage.

3,273,052
INDUCTIVE POSITION INDICATOR SYSTEM
Eric Miles Langham, 14 The Close, Norwich, Norfolk, England
Filed July 5, 1963, Ser. No. 292,904
Claims priority, application Great Britain, Mar. 3, 1958, 6,814/58
16 Claims. (Cl. 323—48)

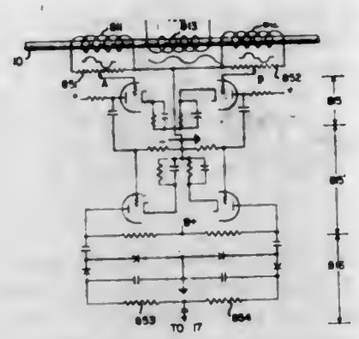


1. An electrical device for measuring the relative position of two relatively movable parts, comprising first and second elongated members which are adapted to be coupled to the respective parts so that relative movement of the parts causes relative linear movement of the members, a first distributed winding extending along the first member parallel with the direction of the relative linear movement and including oppositely wound sections extending respectively in opposed directions from a datum point on the first member, each section having a progressively varying turns density along the first member with the turns density at any selected point therealong linearly proportional to the distance of the selected point from the datum point, and a second distributed winding extending along the second member parallel with the direction of the relative linear movement, the second winding being of smaller extent than that of the first winding, whereby when the first and second members are arranged so that the location of the second winding, along a direction parallel with the direction of relative linear movement, is between the locations of respectively ends of the first winding and an A.C. potential is applied to the second winding an E.M.F. of magnitude linearly proportional to the relative positions of the said members is induced in the first winding.

3,273,053
MULTIPLE CONNECTED TRANSFORMER
Jack W. T. Allen, 312 N. 41st St., Fort Smith, Ark., and Ralph E. Anderson, 905 W. Vandervoort Ave., De Queen, Ark.
Filed Mar. 29, 1963, Ser. No. 269,010
14 Claims. (Cl. 323—48)

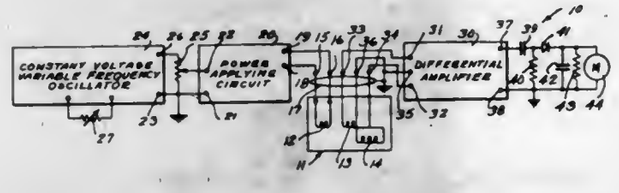
14. In a transformer unit,
(a) a plurality of primary windings and a plurality of secondary windings magnetically coupled thereto,
(b) first switch means interconnecting said primary windings to selectively establish a single phase input and a three phase input, and
(c) a second switch means interconnecting said secondary winding to selectively establish a single phase output and a three phase output.

3,273,054
PIPE JOINT LOCATOR COMPRISING MOBILE TRANSFORMER UTILIZING THE PIPE AS LOW RELUCTANCE PATH BETWEEN PRIMARY AND SECONDARY
Robert W. Cook, Decatur, Ind., assignor to C. W. Fuelling, Inc., Fort Wayne, Ind., a corporation of Indiana
Filed Nov. 16, 1961, Ser. No. 152,736
4 Claims. (Cl. 324—37)



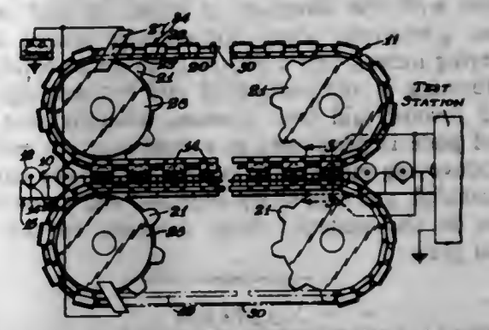
1. A pipeline joint-locating device comprising:
primary and secondary inductors, said primary inductor having a first elongated core of ferromagnetic material and a first coil mounted thereon, and said secondary inductor having a second elongated core of ferromagnetic material and a second coil mounted thereon;
a mobile frame supporting said inductors in mutually inductive spaced relation, the spacing of said inductors being predetermined to provide a high reluctance field between said inductors;
four ferromagnetic wheels mounted to said cores, said wheels being disposesd with their axes of rotation lying in two horizontally spaced planes, said planes being parallel to said cores and said wheels being spaced from each other for stably supporting said device and its frame in a horizontal pipe of ferromagnetic material to provide a low reluctance path between said inductors through the pipe.

3,273,055
CONSTANT IMPEDANCE DUAL CIRCUITS FOR SAMPLE MATERIAL FLAW DETECTION
George F. Quittner, Cleveland Heights, Ohio, assignor, by mesne assignments, to API Instruments Company, Chesterland, Ohio, a corporation of Ohio
Continuation of application Ser. No. 187,875, Apr. 16, 1962. This application Oct. 18, 1965, Ser. No. 502,766
5 Claims. (Cl. 324—37)



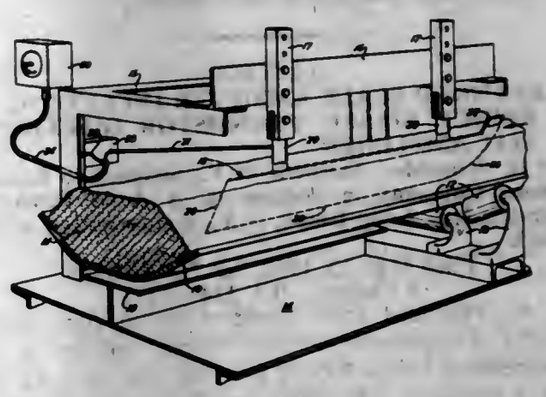
1. Apparatus for detecting a flaw in a relatively moving sample having relatively extended length and a longitudinal axis which coincides with the direction of relative movement, comprising the combination of:
a field generating device having two ends and arranged coaxial with the sample without magnetic material intervening between said field generating device and sample,
a first sensing coil arranged coaxial with the sample without magnetic material intervening between said sensing coil and sample, said sensing coil being located adjacent one of said field generating device ends,
a second sensing coil arranged coaxial with the sample without magnetic material intervening between said second sensing coil and sample, said second sensing coil being located adjacent the other of said field generating device ends,

a first voltage divider having two ends and a tap with the ends thereof connected to be energized by the first sensing coil,
a second voltage divider having two ends and a tap with the ends thereof connected to be energized by the second sensing coil.
first and second controllable electronic devices each having a load circuit and a control circuit and wherein each control circuit has an impedance which is high compared to that of each of said first and second voltage dividers,



connections connecting the tap and one end of the first voltage divider with the control circuit of the first electronic device and connecting the tap and one end of the second voltage divider with the control circuit of the second electronic device,
voltage supply means,
load resistors, and
connections from said voltage source through said load resistors respectively to the load circuits of each of said first and second electronic devices, to derive useful outputs therefrom.

3,273,056
EDDY CURRENT TESTING SYSTEM IN WHICH THE POWER APPLYING CIRCUIT HAS A LOW OUTPUT IMPEDANCE RELATIVE TO THE EFFECTIVE INPUT IMPEDANCE OF THE TEST COIL UNIT
John J. Flaherty, Elk Grove Village, and John M. Mountz, Niles, Ill., assignors, by mesne assignments, to Magnaflux Corporation, Chicago, Ill., a corporation of Delaware
Filed Mar. 22, 1963, Ser. No. 267,201
7 Claims. (Cl. 324—40)

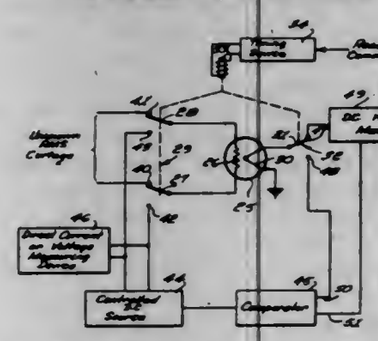


1. In an eddy current testing system for determining the characteristics of a test piece, a test coil unit including a primary winding and a pair of differentially connected secondary windings, signal measuring means connected to said differentially connected secondary windings, a variable frequency oscillator operable over a certain frequency range, and a power applying circuit connected to said oscillator and to said primary winding of said test coil unit, said power applying circuit having a substantially constant voltage output over said frequency range and having a low effective output impedance relative to the effective input impedance of said test coil unit.

3,273,057
APPARATUS FOR CONTINUOUS VOLTAGE APPLICATION IN TESTING
Richard C. Peterson, North Adams, and John M. Seacord, Williamstown, Mass., assignors to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
Filed Dec. 31, 1963, Ser. No. 334,854
3 Claims. (Cl. 324—60)

2. In a method of determining electrical characteristics of an indeterminate plurality of capacitors having axially extending leads, the steps of grasping one lead of a capacitor having axially extending leads between a first pair of moving resilient contacts having a low electrical resistance in relation to the electrical resistance of said capacitor, grasping the other lead of the capacitor between a second pair of moving resilient contacts, moving the capacitors progressively along a line of travel with said leads extending normal to the direction of travel, moving said first and second pairs of grasping contacts in contact with the respective leads along with and in the same direction of travel as said capacitors, applying an electrical potential between the first and the second pairs of contacts, and moving said capacitor and respective grasping contacts together under said applied electrical charge without interruption of application of said electrical charge to fully charge said capacitor with said potential, and subsequently testing the electrical characteristics of said capacitor without interruption of application of said electrical charge.

3,273,058
ELONGATED RELATIVELY THIN METAL CAPACITOR PROBE IN COMBINATION WITH A CONVEYING MEANS FOR DETERMINING THE DIELECTRIC PROPERTIES OF BULK MATERIAL
Samuel B. Prellwitz, Pittsburgh, Pa., assignor to United States Steel Corporation, a corporation of New Jersey
Filed Mar. 23, 1961, Ser. No. 97,857
4 Claims. (Cl. 324—61)



3. In a dielectric apparatus for measuring the moisture content of bulk material subject to contain foreign bodies of the nature of wire or string, which apparatus includes a frame, an electrode plate spaced beneath said frame, a

capacitance bridge circuit to which said plate is connected, and means for conveying a stream of the material through the space between said frame and said plate from a first location to a second location, the combination therewith of a probe electrically connected to said circuit and comprising an elongated relatively thin metal plate, and support means on the upper edge of said second-named plate suspending it from said frame, said second-named plate having flat side faces lying in vertical planes parallel with the direction of travel of said conveying means, a relatively sharp bottom edge spaced over said conveying means, and a relatively sharp smoothly curved end forming a continuation of said bottom edge and directed toward said first location, whereby said second-named plate is positioned to extend into the material on said conveying means and to be substantially covered by the material, and said sharp edge and end prevent foreign bodies in the material from catching on the second-named plate.

3,273,059
THERMAL CONVERTER TYPE R.M.S. METER UTILIZING SIGNAL STORAGE AND COMPARISON

Jack S. Andresen, Pinole, and Alan B. MacLane, Pleasant Hill, Calif., assignors to Beckman Instruments, Inc., a corporation of California

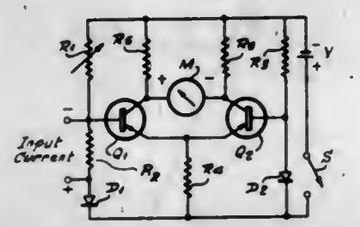
Filed Oct. 4, 1962, Ser. No. 228,371
16 Claims. (Cl. 324—106)

9. A meter for measuring the root mean square value of an input electrical signal comprising:

a thermal converter element;

storage means for storing an electrical signal;

comparison means responsive to first and second input signals for generating a measured output signal; and



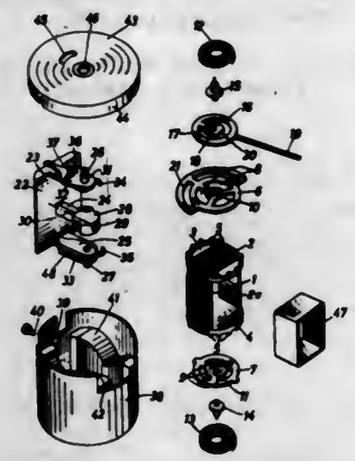
means for selectively connecting first the input of said thermal converter element to said input electrical signal and the output of said thermal converter element to said storage means and then the input of said thermal converter element to said measured output signal and the outputs of said storage means and said thermal converter element to said comparison means as said first and second input signals.

3,273,060
EXPANDED SCALE AMMETER INCLUDING A BRIDGE BIASED TRANSISTOR DIFFERENTIAL AMPLIFIER

Kurt H. Schneider, Maspeth, N.Y., assignor to Expando Meter Company, a division of A & M Instrument Service, Inc., Long Island, N.Y., a corporation of New York

Filed Mar. 13, 1962, Ser. No. 181,225
8 Claims. (Cl. 324—131)

1. An expanded scale ammeter circuit comprising a plurality of impedance elements coupled together to form an impedance bridge having four legs and four leg junctions, a transistor differential amplifier circuit having two signal input terminals and two power input terminals, said amplifier circuit containing a meter, said meter being adapted to produce a meter indication proportional to the magnitude of current therethrough in one direction of current flow but not for the opposite direction of current flow and also proportional to the difference of potential between said two signal input terminals, said two signal input terminals being coupled to two opposing junctions of said bridge circuit, a D.C. voltage source coupled across the other two junctions of said bridge circuit and across the power input terminals of said amplifier circuit, one of said bridge legs comprising a low impedance input shunt having an impedance in the range of approximately 0 to 2 ohms, said low impedance input shunt being connected to current input terminals to receive an input current applied directly thereto and to

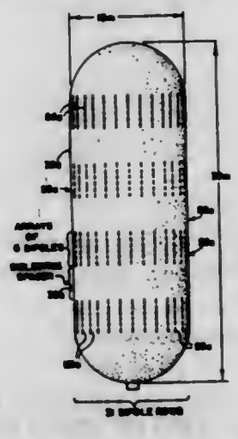


pass all of said latter current therethrough to develop an input signal proportional thereto at one of said two opposing junctions of said bridge circuit, and said impedance bridge being adapted to initially bias said differential amplifier circuit to produce a current flow in said other direction through said meter when said input current is below a predetermined starting level, thereby producing a current flow in said one direction through said meter when said input current is above said predetermined starting current level, whereby said meter deflects in proportion to the magnitude of input current above said predetermined starting current level but not below said predetermined starting current level.

3,273,061
GALVANOMETER COIL ASSEMBLY HAVING A PLASTIC COIL FRAME

Fritz Rümpelein, Munich, and Paul Kopf, Unterhaching, near Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen-Bayerwerk, Germany, a corporation of Germany

Filed Feb. 23, 1962, Ser. No. 175,117
Claims priority, application Germany, Mar. 1, 1961, A 36,855
8 Claims. (Cl. 324—151)



1. A coil assembly for a moving coil type of galvanometer comprising a molded plastic frame having a longitudinal axis and a pair of flat circular ends connected by longitudinal stringers, a plurality of integral plastic lugs on the periphery of the circular ends of said frame projecting away from said ends, said lugs including two pairs of spaced lugs, a coil wound longitudinally about said frame between the pairs of spaced lugs, a

flat circular bearing flange mounted on each of said ends between said lugs with said coil being between each of said ends and its flange, said lugs being bent over the flanges to hold said flanges in place, pivot points secured to each of said flanges located on said longitudinal axis and extending outwardly from said flanges, a pointer unit secured to one of said flanges, and said unit including a circular mounting ring adapted to fit within said lugs mounted against its flange and a pointer extending radially from said mounting ring.

3,273,062
SYSTEM OF PROPAGATING RADIO ENERGY BY MEANS OF ARTIFICIAL SCATTERERS

Herbert P. Raabe, St. Paul, Minn., assignor, by mesne assignments, to Litton Systems, Inc., Beverly Hills, Calif., a corporation of Maryland

Filed Aug. 30, 1963, Ser. No. 305,683
1 Claim. (Cl. 325—14)

A system of propagating radio energy by means of artificial scatters, which comprises:

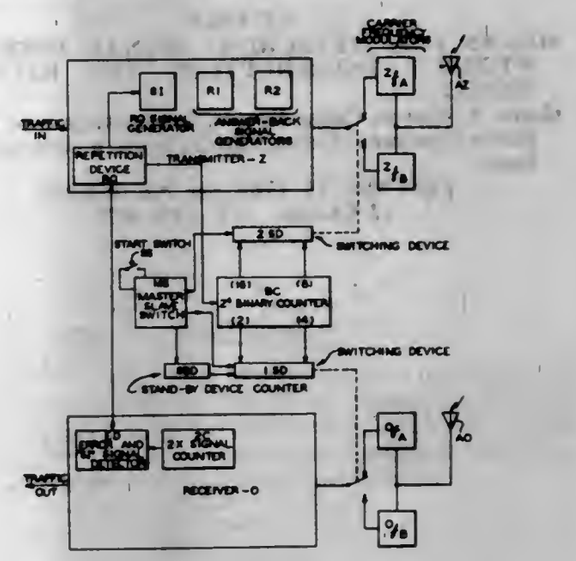
a generally cylindical balloon oriented in space with its longitudinal axis pointed toward the earth so that one end thereof is higher than the other;

a network of dipoles supported by said balloon, said dipoles being of a length such as to be substantially tuned to a given frequency, said dipoles being grouped in longitudinally spaced layers with each layer containing a predetermined number of circumferentially spaced rows of dipoles, those of said dipoles farther from the earth in any given layer being longer and those dipoles nearer the earth being shorter than those dipoles located centrally in said given layer;

means for transmitting radio signals from one locus on the earth's surface in the direction of said balloon corresponding generally to said given frequency; and

means for receiving at a different locus on the earth's surface those radio signals scattered from said network.

3,273,063
CARRIER TRANSMISSION TELEGRAPH SYSTEM



Herman da Silva, Voorburg, and Hendrik Cornelis Anthony van Duuren, Wassenaar, Netherlands, assignors to de Staat Nederlanden, ten Deze Vertegenwoordigd Door de Directeur-Generaal der Posterijen, Telegrafie en Telefonie, The Hague, Netherlands

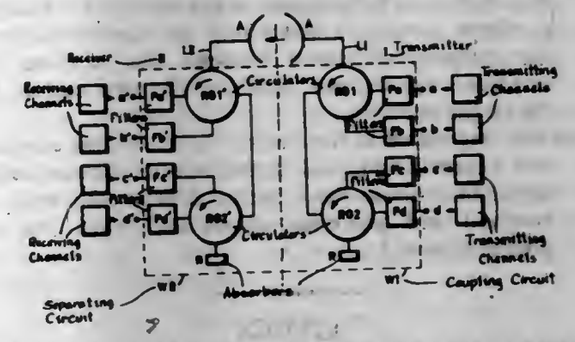
Filed Aug. 23, 1962, Ser. No. 218,894
Claims priority, application Netherlands, Aug. 30, 1961, 268,787/61
23 Claims. (Cl. 325—41)

1. In a telecommunication system in which traffic is sent in separate groups of signals from a master station to a remote slave station, and said slave station sends answer-back signals in the spaces between each group of traffic signals to indicate the next group to be sent depending upon the correct reception of the preceding group by the slave station, said group and space thereafter comprising one signal cycle, the improvement comprising:

(A) transmitting said signals on one of at least two predetermined carrier frequencies,

(B) changing the carrier frequency from one of said signals at its receiving station when one of the two following conditions have been detected:

(1) two successive erroneous signals,



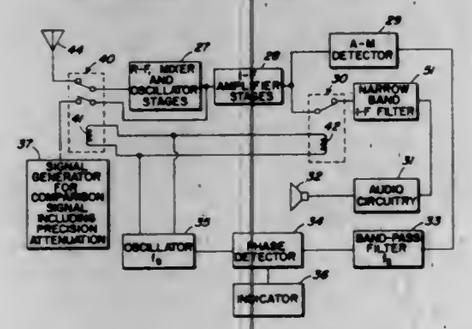
(2) two successive requests for repetition, and

(C) changing the carrier frequency for transmitting said one signal at its transmitting station to said one changed carrier frequency a predetermined number of signal cycles after said one carrier frequency change in said receiving station.

3,273,064
DIRECTIONAL RADIO SYSTEM WITH DISTORTION CORRECTING CIRCUITS

Friedrich Künemund, Munich, Germany, assignor to Siemens & Halske Aktiengesellschaft Berlin and Munich, a corporation of Germany

Filed Apr. 27, 1962, Ser. No. 190,540
Claims priority, application Germany, Apr. 28, 1961, 73,736
7 Claims. (Cl. 325—55)



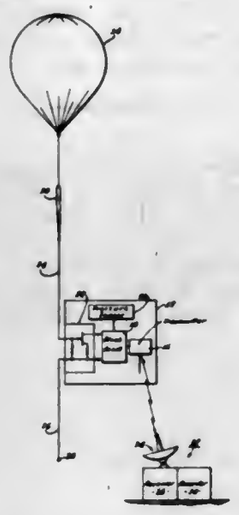
1. A directional radio transmission and cooperating receiving system comprising a number of high-frequency transmission channels, to each of which is allocated an individual transmitter, a combining circuit arrangement operatively connecting the individual transmitters to a common antenna for transmission to a common receiving antenna, a separating circuit arrangement operatively connecting the receiving antenna to individual receivers of like construction, the combining circuit arrangement having different input points, each allocated to a different one of the several channels, which points correspond in circuit positions to a corresponding number of output points from the separating circuit, the input point of each

individual channel to the combining circuit and its output point from the separating circuit being relatively selected so that each channel is subjected to the same number of reflection points between the transmitter and receiver and transist time difference between the signals in different channels are minimized.

3,273,065
MEANS FOR MEASURING SIGNAL INTENSITY WITHOUT INTERRUPTING THE RECEIVED SIGNAL

Harris A. Stover, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Filed Mar. 16, 1964, Ser. No. 352,200
12 Claims. (Cl. 325—67)



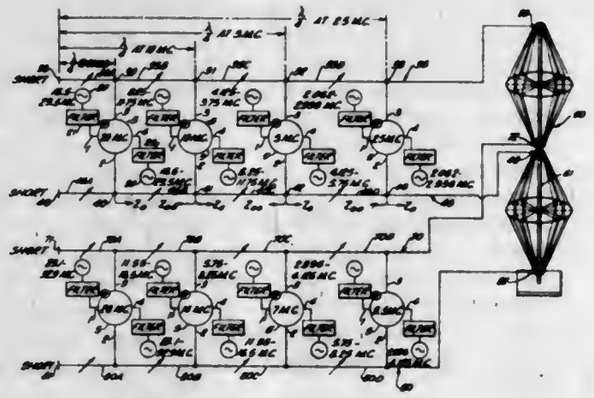
1. Signal intensity measuring means in combination with receiver means which comprises:
R-F stage means,
I-F stage means,
and audio stage means arranged in tandem,
said signal intensity means comprising:
signal generator means for generating a reference signal f_r antenna means for intercepting a received signal of carrier frequency f_c,
first switching means for alternately switching the signal intercepted by said antenna means and the reference signal to said receiver means at a switching frequency f_s,
signal source means for supplying a signal of frequency f_s to energize said first switching means where f_s is at least one and one-half times f_c,
comparison channel means responsive to the intensity difference between the received signal and the reference signal to provide an output signal of frequency f_s whose amplitude and phase are representative of the intensity difference between the received and reference signals and which of the two signals has the larger intensity,
means responsive to the output signal of said comparison channel and said signal source means output signal to indicate the intensity different between the received and reference signals and which has the greater intensity.

3,273,066
APPARATUS FOR DETECTING CHANGES IN THE ATMOSPHERIC ELECTRIC FIELD

Lothar H. Ruhnke, Minneapolis, Minn., assignor to Litton Systems, Inc., Beverly Hills, Calif.

Filed Dec. 20, 1963, Ser. No. 332,186
4 Claims. (Cl. 325—113)

1. An apparatus for sensing electrostatic conditions in the atmosphere comprising:
a radiosonde apparatus including means for modulating the output frequency thereof, said means including an R-C circuit;
a pair of probes positioned in respectively different locations in the atmosphere with respect to said radiosonde;
a field effect transistor having its drain and gate terminals connected across said pair of probes and having its source and drain terminals connected in series with the resistance of said R-C circuit to modulate said radiosonde; and

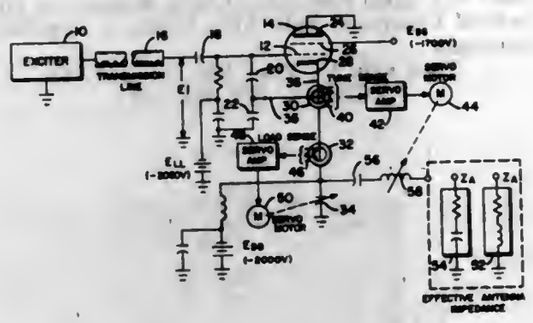


a stabilizing high resistance connected across the two probes and across said gate and drain terminals of said transistor.

3,273,067
HYBRID RING MULTICOUPLER FOR A PLURALITY OF PAIRS OF TRANSMITTERS

Charles E. Wolcott, El Cajon, Calif., assignor to Whittaker Corporation, a corporation of California

Filed Mar. 28, 1963, Ser. No. 268,682
11 Claims. (Cl. 325—129)

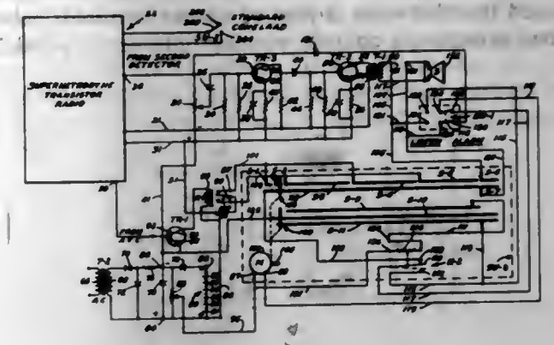


1. In a system of the character described wherein it is desired to couple a plurality of transmitters to a single antenna, a first hybrid ring, a second hybrid ring, a first pair of transmitters each operating at a frequency somewhat different than a first nominal frequency and each being coupled to said first ring, a second pair of transmitters each operating at a frequency different than a second nominal frequency and each being coupled to said second ring, a transmitting antenna, and means coupling each of said rings to said antenna, said coupling means including connections between said first and second rings, said connections having an electrical length substantially equal to one-half of the wavelength of one of said nominal frequencies for isolating said first ring from said second ring.

3,273,068
REMOTE CATHODE FOLLOWER POWER AMPLIFIER WITH AUTOMATIC ADJUSTMENT OF TUNING AND LOADING

Henry E. Bruns, St. Paul, and Edwin M. Stryker, New Brighton, Minn., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

Filed July 1, 1963, Ser. No. 292,032
1 Claim. (Cl. 325—174)



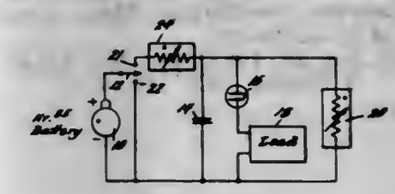
An impedance matching system for coupling the output signal of an RF transmitter to an antenna comprising:
an RF transmitter comprising an exciter for providing an output signal;
a cathode follower power amplifier located remote from said transmitter for amplifying said exciter output signal, said cathode-follower comprising:
an anode coupled to ground,
a control grid coupled to said exciter for receiving said exciter output signal and
a cathode for providing an amplified exciter output signal;
an antenna for transmitting said amplified exciter output signal located in close proximity to said cathode follower;
first variable reactance means coupled to said cathode and to said antenna;
second variable reactance means coupled to said cathode and to ground;
a phase detector coupled to said cathode and said control grid for detecting a phase difference between said exciter output signal and said amplified exciter output signal;
first means coupled to said phase detector and said first variable reactance for automatically varying said first variable reactance to provide maximum antenna power output;
load sensing means coupled to said cathode for sensing the load on said cathode; and
second means coupled to said load sensing means and said second variable reactance for automatically varying said second variable reactance to provide maximum antenna power output.

3,273,069
CONELRAD WARNING DEVICE

Bryant F. Craig, Arlington, Tex., assignor to Amalga Corporation, Dallas, Texas, a corporation of Texas

Filed Nov. 8, 1961, Ser. No. 151,035
8 Claims. (Cl. 325—466)

4. A warning device responsive to a transmitted signal code, comprising; radio receiver means; alert signaling means; decoding means for energizing said alert signaling means, said decoding means being responsive to said signal code; said alert signaling means being rendered operative in response to an output from said receiver means; said decoding means including relay means responsive to said signal code; switch actuating means; driving means for driving said switch actuating means; switch means for energizing said alert signaling means when actuated by said switch actuating means; said relay means sequentially energizing and de-energizing said driving means in accordance with said signal code; said driving means intermittently driving said switch actuating means a predetermined distance toward said switch means when energized by said



relay means; said switch actuating means actuating said switch means, thereby energizing said alert signaling means; said device further including means for preventing operation of said driving means in response to false actuation of said decoding means.

3,273,070
DELAY TIMER

Laurence R. Alexander, Armonk Village, N.Y., assignor to Leesona Corporation, Warwick, R.I., a corporation of Massachusetts

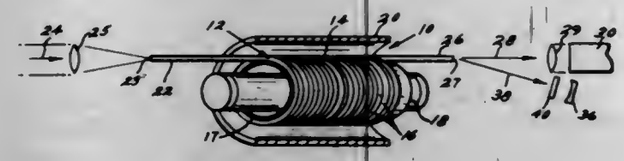
Filed Dec. 17, 1962, Ser. No. 245,157
7 Claims. (Cl. 328—84)

4. A time delay circuit comprising a radioactive battery, a charging circuit adapted to be connected to said battery, said charging circuit including a capacitor and a constant current device having a constant current capacity characteristic extending substantially constant over a period exceeding a year connected between said battery and said capacitor, a parallel network connected to said capacitor including a constant current gating device having a decaying current flow characteristic extending over a time period exceeding one month and a parallel branch including voltage responsive threshold means and a serially connected load to pass current to said load when the capacitor is charged with a voltage exceeding the threshold voltage of said threshold means.

3,273,071
MAGNETIC AMPLIFIER

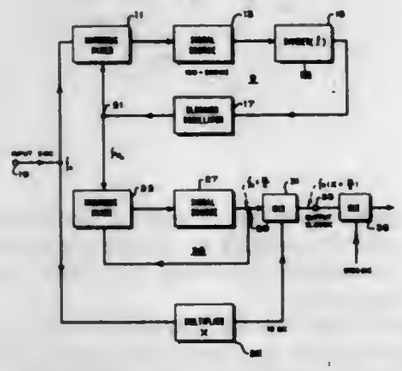
Stuart P. Jackson, Columbus, Ohio, assignor to Solidstate Controls, Inc., a corporation of Ohio

Filed July 11, 1962, Ser. No. 209,063
5 Claims. (Cl. 330—9)



1. A difference amplifier comprising a first and a second loop circuit having a common arm, a gate winding connected in opposition in each of said loop circuits, a source of D.C. reference potential connected between one end of said common arm and one end of said gate winding, a pair of serially connected reset resistors and diodes connecting the other end of said common arm to the other end of said gate windings, a pair of second diodes, a pair

of load resistances, means for serially connecting one of said second diodes and a load resistor to one of said other ends of one of said gate windings means for serially connecting the other of said second diodes and a load resistor to the other end of said other gate winding, the said pair of series connected networks having a junction point connected therebetween, a pair of output terminals across said load resistors, a control winding differentially linking

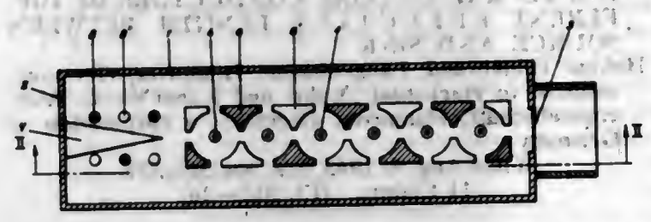


both of said gate windings, a source of direct current control voltage, means for coupling said direct current voltage across said control winding wherein the said voltage is applied through the oppositely poled gate windings and circuitry thereof for producing in the output circuit a difference signal a voltage difference across said output terminals in accordance with the magnitude of current flowing in said control winding.

3,273,072
LASER AMPLIFIER WITH VARIABLE GAIN CONTROL
Charles J. Koester, South Woodstock, Conn., and Noble S. Williams, Starbridge, Mass., assignors to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Filed Jan. 18, 1965, Ser. No. 426,030
9 Claims. (Cl. 330—4.3)

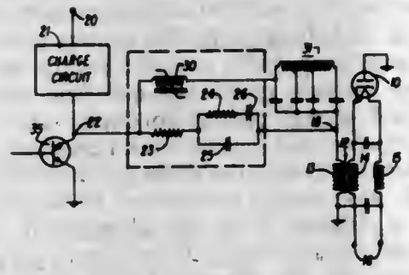
1. A laser amplifier construction comprising a thin elongated component formed of a transparent material of a predetermined refractive index and including an active laser ingredient therein, said component having an optically finished flat end surface formed on the entrance end thereof for admitting into said component optical signals to be amplified, said component having a second optically finished flat end surface formed on the opposite exit end thereof for allowing said optical signal after amplification to pass outwardly therethrough, optical pumping means positioned adjacent an extended intermediate portion of said laser component for producing an inversion in population therein and a gain in amplification in optical signals passing therethrough, signal detecting means disposed substantially in axially aligned spaced relation to the exit end of said component so as to receive optical energy and including said amplified signals, and light-collecting and re-directing means disposed in spaced relation to the exit end of said component and in such offset relation to an optical axis extending between said exit end and said detecting means as to intercept off-axis optical energy being emitted from said exit end during said signal amplification, said light-collecting and re-directing means including concavely curved mirror means so angularly positioned relative to said exit end as to direct at least a part of the optical energy received thereby back into said component through said exit surface for effecting a control as to the gain in the optical signal amplification being provided by said component.

3,273,073
FREQUENCY SYNTHESIZER
Leonard S. Cutler, Palo Alto, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California
Filed Feb. 19, 1964, Ser. No. 345,968
3 Claims. (Cl. 331—38)



1. Signal apparatus comprising:
first and second harmonic mixers, each having a pair of inputs for producing an output related to the phase relationship between signals applied to the inputs thereof;
a first source of signal of variable frequency having an output which is connected to corresponding inputs of the first and second harmonic mixers for applying said signal of variable frequency thereto, said first source having an input which is connected to receive the output of the first mixer for varying the frequency of signal from said first source to maintain phase lock between a signal applied to the remaining input of the first mixer and a selected integer multiple of the signal of variable frequency from said first source;
a second source of signal of variable frequency having an output which is connected to the remaining input of the second harmonic mixer and having an input which is connected to receive the output of the second harmonic mixer for altering the frequency of signal from said second source to maintain phase lock between the signal therefrom and a selected integer multiple of the signal from said first source; and
means including the output of said second source for providing an output frequency proportional to the frequency of signal applied to said remaining input of the first harmonic mixer.

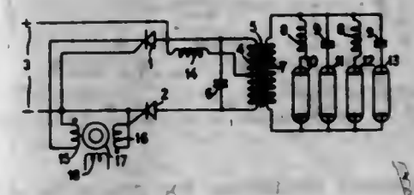
3,273,074
ELECTRONICALLY TUNABLE MAGNETRON-TYPE MICROWAVE GENERATOR
Walter Sobottka, 79 Blvd. Haussmann, Paris, France
Filed July 20, 1964, Ser. No. 383,673
Claims priority, application France, July 31, 1963, 943,271, Patent 1,372,557
10 Claims. (Cl. 331—50)



1. A multi-magnetron oscillator arrangement comprising:
an elongated evacuated enclosure having two terminal walls, one of said walls being provided with a window transparent to electromagnetic waves,

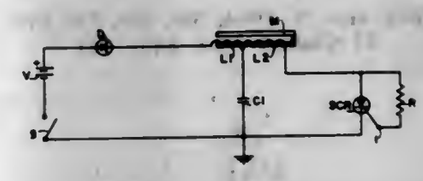
absorbing means disposed within the enclosure adjacent the other terminal wall,

and a number of magnetron means, coupled to each other and disposed within the enclosure between said absorbing means and said window.



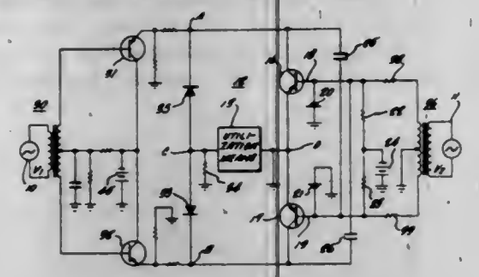
3,273,075
PULSE GENERATOR SYSTEM PROVIDING PULSE SUPERIMPOSED ON PEDESTAL
Howard L. Kennedy, Phoenix, Ariz., assignor to Motorola Inc., Chicago, Ill., a corporation of Illinois
Filed Aug. 19, 1963, Ser. No. 303,003
5 Claims. (Cl. 331—87)

2. A circuit for providing an exciting pulse for a magnetron oscillator including in combination, voltage supply means havng a first terminal for providing a charging potential, output means for applying a pulse to the magnetron oscillator connected between a second terminal and a reference potential, a first circuit including a pulse forming network and a saturable reactor connected in series between said first and second terminals, said first circuit providing current flow from said voltage supply means through said saturable reactor to charge said pulse forming network and store energy therein, a second circuit including capacitor means and resistor means connected between said first and second terminals, said second circuit providing current flow from said voltage supply means through said resistor means to charge said capacitor means, and switch means for connecting said first terminal to the reference potential whereby said capacitor means discharges through said resistor means and said output means to provide a voltage thereacross forming a pulse pedestal, and said pulse forming network discharges through said saturable rector and said output means, said saturable reactor initially presenting high impedance to discharge of said pulse forming network with such impedance decreasing as discharge current flows to provide a delayed high power voltage pulse across said output means superimposed on said pulse pedestal.



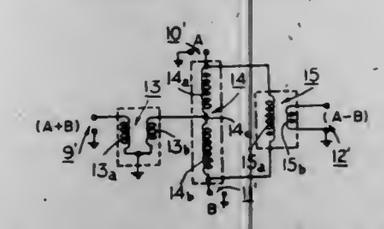
3,273,076
SELF-GENERATING INVERTER WITH CONTROLLED SEMI-CONDUCTOR RECTIFIERS
Johannes Jacobus Wilting, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Jan. 22, 1962, Ser. No. 167,493
Claims priority, application Netherlands, Jan. 23, 1961 260,387
9 Claims. (Cl. 331—113)

1. A self-generating inverter comprising: a controlled semi-conductor rectifier having p-n layers, main current circuit electrodes and a control electrode, said rectifier producing in circuitry connected to said control electrode a current pulse as a consequence of the flow of free charge carriers in said rectifier upon the interruption of current flow through said main current circuit electrodes, said main circuit electrodes being direct current conductively connected to respective terminals of a direct current supply source, means for periodically interrupting current flow to said main current circuit electrodes comprising a series oscillatory circuit including a first portion having an inductive reactance and a second portion having a



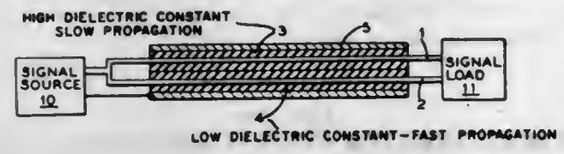
capacitive reactance, said series oscillatory circuit being connected between one of the main circuit electrodes of said rectifier and the corresponding terminal of said direct current supply source, a load coupled to said oscillatory circuit, and means for periodically rendering the controlled rectifier conductive, said means comprising a control circuit connected between a main circuit electrode and the control electrode of said controlled rectifier, polarity-reversing time delay means connected to said control circuit and means for applying said current pulse to said delay means.

3,273,077
SCR SINE WAVE GENERATOR
Hans R. Camenzind, Lexington, Mass., assignor to P. R. Mallory & Co. Inc., Indianapolis, Ind., a corporation of Delaware
Filed Feb. 26, 1965, Ser. No. 435,542
7 Claims. (Cl. 331—116)



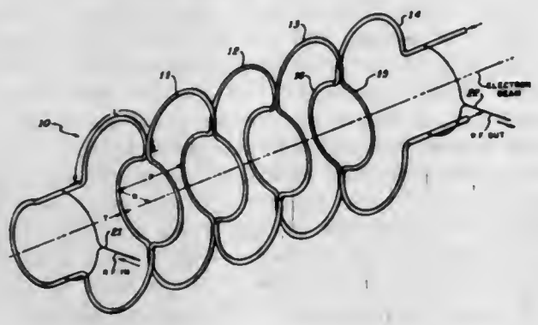
1. An alternating current sine wave generator activated by a direct current source having positive and negative terminals, said generator comprising: a diode having a cathode and an anode; an autotransformer having start and finish terminals with a tap approximately centrally located thereon and a capacitance means attached thereto; a silicon controlled rectifier having an anode, a cathode and a gate; said positive terminal of said direct current source connected to said anode of said diode; said cathode of said diode connected to said start terminal of said autotransformer; said finish terminal of said autotransformer connected to said anode of said silicon controlled rectifier; a capacitor, said capacitor connected between said tap on said autotransformer and a common point between said negative terminal of said direct current source and said cathode of said silicon controlled rectifier; and means for triggering said silicon controlled rectifier at predetermined times so as to provide a sine wave output across said capacitance means at a frequency determined by the characteristics of said capacitance means, said capacitor, and said autotransformer, said triggering means connected to said gate of said silicon controlled rectifier.

3,273,078
DOUBLE SIDEBAND SUPPRESSED CARRIER MODULATOR
Thomas Mollinga, Sierra Madre, Calif., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed July 1, 1963, Ser. No. 291,853
6 Claims. (Cl. 332—43)



5. A balanced modulator for producing double side band suppressed carrier modulated signals comprising a first source of modulating signals, means for splitting the modulating signals into two signals having substantially equal amplitude and opposite phase relationships, means for utilizing the output signal of the balanced modulator, a diode corresponding to each of the two modulating signals, means for applying each signal in parallel through its corresponding diode to the utilization means, means for forward biasing both diodes, a source of carrier signals, means responsive to the carrier signal source for alternately shunting to ground reference for substantially equal amounts of time each of the two modulating signals so as to back bias the corresponding diode.

3,273,079
HYBRID CIRCUIT HAVING SEPARATE COUPLING TRANSFORMERS AT THE SUM PORT AND DIFFERENCE PORT AND HAVING TUNING MEANS TO IMPROVE OPERATION
John P. Curtis, Reading, Mass., assignor to Adams-Russell Co., Inc., Waltham, Mass., a corporation of Massachusetts
Filed Mar. 5, 1964, Ser. No. 349,583
11 Claims. (Cl. 333—11)

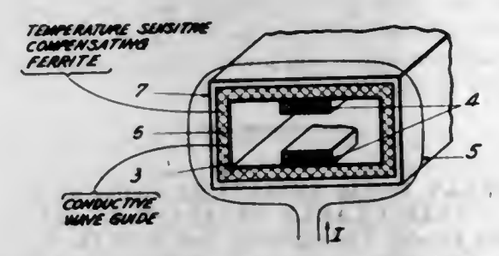


1. Broadband electrical hybrid apparatus comprising a pair of coil sections each having a different connection port at one end thereof, balance-to-unbalance transformer means having winding means connected with said coil sections at the sites of said connection ports and inductively coupling signals between a third connection port and said coil sections, transformer means including winding means connected with the other ends of said coil sections to conduct net currents flowing through said coil sections and thereby inductively coupling signals between a fourth connection port and said coil sections, and means tuning the effective shunt and series inductances of said coil sections and transformer means in bandpass filter relationship, whereby the power of signals independently applied to said fourth port and to said third port is divided equally between said different ports, and whereby signals applied to said different ports produce summation signals at said fourth port and difference signals at said third port.

3,273,080
HIGH-FREQUENCY TRANSMISSION LINE HAVING PLURAL COAXIAL CONDUCTORS OF DIFFERENT EFFECTIVE LENGTH BETWEEN SOURCE AND SINK
Helmut Hildebrand, Langenhagen, Hannover, Germany, assignor to Hackethal Draht- und Kabel-Werke Aktiengesellschaft, Hannover, Germany, a corporation of Germany
Filed Aug. 6, 1963, Ser. No. 300,337
11 Claims. (Cl. 333—26)

1. A symmetrical high-frequency electromagnetic wave energy transmission line comprising two spaced central conductors, a common outer conductor enclosing said central conductors and spaced therefrom, a first dielectric medium surrounding said first central conductor and occupying the space between said first central conductor and said outer conductor, and a second dielectric medium different from the first mentioned dielectric medium surrounding said second central conductor and occupying the space between said second central conductor and said outer conductor whereby the propagation velocity of electromagnetic wave energy transmitted by said first central conductor is different from the propagation velocity of electromagnetic wave energy transmitted by said second central conductor, the physical length of the transmission line being such that the electrical length of said first and second central conductors differ by an integral number of half operating wavelengths.

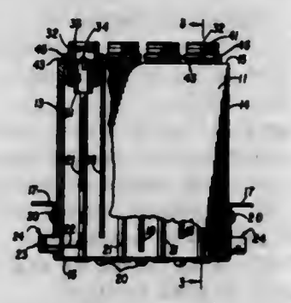
3,273,081
FLUID-COOLED SLOW-WAVE STRUCTURE HAVING ALTERNATING LONGITUDINAL AND TRANSVERSE EXTENDING PORTIONS
Irving Itzkan, New York, N.Y., assignor to Sperry Rand Corporation, Great Neck, N.Y., a corporation of Delaware
Filed May 31, 1962, Ser. No. 198,997
5 Claims. (Cl. 333—31)



1. A fluid-cooled slow wave propagating structure comprised of

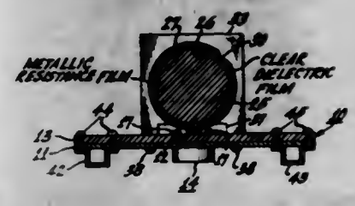
a plurality *n* of tubular conduits of conductive material symmetrically disposed about an axis and each lying substantially entirely within a respective angular sector that extends parallel to said axis, *n* being an integer,

each of said conduits being comprised of alternately disposed longitudinally-extending and transversely-extending portions that are arranged to form a serpentine-like configuration throughout the length of its respective angular sector,



each transversely-extending portion traversing a given angular extent about said axis and the longitudinally-extending portions at the two ends of a transverse portion lying in respective axially-extending planes that intersect along said axis at an oblique angle, the *n* conduits being disposed about said axis with the transverse portions located in successive transverse planes in a manner to form successive closed configurations about said axis.

3,273,082
TEMPERATURE COMPENSATED RECIPROCAL FERRITE PHASE SHIFTER
Bernard Pierre Chiron, Kremlin-Bicetre, France, assignor to Lignes Telegraphiques et Telephoniques, Paris, France, a joint-stock company
Filed Dec. 11, 1963, Ser. No. 329,921
Claims priority, application France, Dec. 12, 1962, 918,341
6 Claims. (Cl. 333—31)

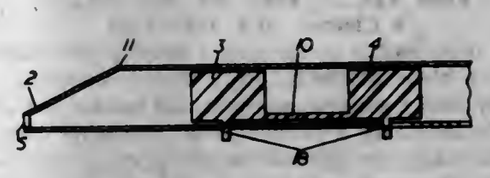


1. Variable phase shifting phase shifter for ultra-high-frequency electromagnetic waves, including a portion of waveguide within which is located at least one element of ferromagnetic material for ultra-high-frequencies and having gyromagnetic properties such as ferrite, a coil wound around said waveguide through which is adapted to pass a D.C. current which can be made to vary in intensity to vary the phase shift of the phase shifter, and at least one tubular ferrite core, called "field compensation" ferrite core, of large variation in permeability with variation in temperature located between said waveguide and said coil wound around said waveguide, the dimensions of said ferrite core or cores and the type of ferrite being selected such that the variation in phase shift with variation in temperature is approximately compensated over a large temperature range.

3,273,083
FREQUENCY RESPONSIVE DEVICE
Gus C. Rose, Wood Dale, Ill., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois
Filed Apr. 14, 1964, Ser. No. 359,582
3 Claims. (Cl. 333—73)

3. A resonant cavity device responsive to applied signals of predetermined frequencies, including in combination, a hollow die-cast integral conducting housing having a plurality of walls forming a plurality of cavities therein and being open at one end, a removable end plate for covering said one end of said housing, said walls of said housing between adjacent cavities being formed to leave a space between said walls and said end plate for intercavity coupling, a plurality of conductive members each extending into a respective one of said cavities and fixed at one end thereof to said end plate, and adjustable capacitor means supported in said housing and being adjusted to vary the resonant frequency of each of said cavities, and each of said conductive members being securely supported at one end by said end plate and at the other end by said capacitor means thereby minimizing variations in the resonant frequency of said cavities caused by vibration of said housing.

3,273,084
VARIABLE ATTENUATOR
Joseph F. McSparran, Cherry Hill, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Mar. 2, 1964, Ser. No. 348,683
4 Claims. (Cl. 333—81)



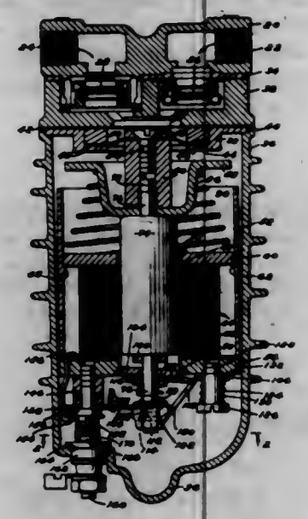
1. A variable attenuator for transmission lines of the type including a first conductor, a second conductor, and means disposing said conductors in close dielectrically spaced parallel relation using a flat board of dielectric material comprising, in combination,

a solid cylinder constructed of dielectric material,

a thin, flexible sheet of dielectric material having a resistive film thereon wrapped around and bonded to said cylinder with said resistive film between said cylinder and said sheet,

support posts mounted on said flat board of dielectric material, means for mounting said cylinder to said support posts for close but free rotative movement over said first conductor with the longitudinal axis of said cylinder being parallel to and equally spaced from said first conductor.

3,273,085
TUNABLE CAVITY RESONATOR
Eric Albert Ash, Eric Andreas Frederik Sell, Thomas Meirion Jackson, and Louis Arthur Vinton, all of London, England, assignors to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 22, 1964, Ser. No. 361,829
Claims priority, application Great Britain, May 13, 1963, 18,875/63
5 Claims. (Cl. 333—83)



1. A tunable cavity resonator comprising a length of waveguide and a pair of tuning slugs of dielectric material movable longitudinally within the waveguide, one of said tuning slugs providing a wall for the cavity, said slugs being spaced by a dielectric member joining them and means to adjust the positions of the slugs.

3,273,086
ELECTROMAGNETIC SWITCHING MECHANISM IN AN ELECTRIC PUMP

William C. Eberline and Alton J. O'Connor, Cass City, Mich., assignors to Walbro Corporation, Cass City, Mich., a corporation of Michigan

Filed Jan. 8, 1964, Ser. No. 336,575
6 Claims. (Cl. 335—87)

1. In a solenoid actuated pump wherein a flexible diaphragm is actuated in a valve pumping chamber, that improvement in an automatic switching mechanism which comprises:

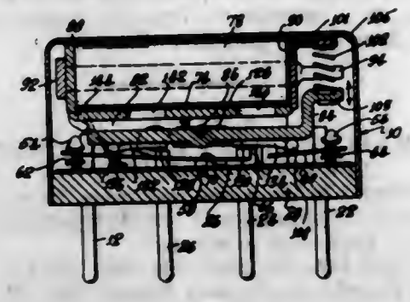
(a) an actuating solenoid,

(b) opposed contact points for opening and closing a circuit to energize and de-energize said actuating solenoid,

(c) first means mounting one of said points in space adjacent the operating axis of said solenoid,

(d) second means movably mounting the other of said points wherein it may move to and from contact with said first point,

(e) an armature movable axially in said solenoid from a retracted to an extended position when the solenoid is energized having a portion positioned to contact and shift said second means in the extended position, and



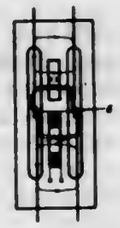
(f) means connecting said armature and said second means resiliently to effect motions of said points toward each other to contact position and means magnetically associating said second means and said armature to bias said points toward each other prior to contact of said armature with said second means to cause positive separation of said points.

3,273,087
MINIATURIZED RELAY

Vandel Curtis Huckabee, Portland, Oreg., assignor to Electronic Specialty Co., Los Angeles, Calif., a corporation of California

Filed Apr. 22, 1963, Ser. No. 274,671
8 Claims. (Cl. 335—128)

1. A relay switch comprising a header and contact assembly, a blade assembly, an armature assembly, a coil assembly, and a suitable housing, said header and contact assembly including a header plate, connector pins, said pins protruding through said header plate in insulated relationship therewith, one end of said pins protruding below said header plate for connection with external circuitry, the other end of said pins extending above said header plate serving as contacts for upper and lower blade contacts, contacts through which coils may be energized, and for connection of switching blades, coils connected to selected pins, said blade assembly including switching blades connected to selected pins, said coil assembly including a frame having downwardly extending legs connected to said header plate and upwardly turned ends for positioning coils therebetween, coils positioned between said ends, a core inserted through said coils, the ends of said core magnetizing said armature upon energization of said coils, said armature assembly consisting of a cross-



bar for contact with said ends of said core, a body portion pivotally mounted on said frame, and insulated actuators on each side of the pivotal point of said body portion and mounted to the undersurface thereof for movement of said blades between upper and lower blade contacts upon energization of said coil.

3,273,088
RELAY WITH ARMATURE CONTACTS, PARTICULARLY REED CONTACTS

Wolfgang Grobe, Ludwigsburg, and Emil Mattes, Bietigheim, Germany, assignors to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware

Filed Apr. 12, 1965, Ser. No. 447,347
Claims priority, application Germany, May 8, 1964, St 22,096
7 Claims. (Cl. 335—153)

1. A relay comprising:

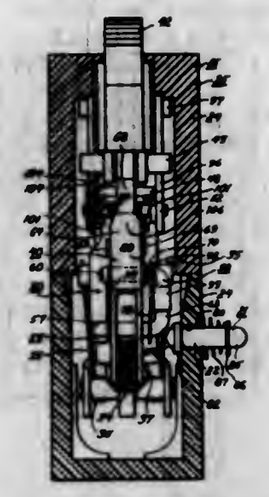
two pairs of reed contacts encapsulated in tubes, spaced parallel to each other and surrounded by air spaces,

said air spaces forming distinguishable regions of space located respectively between said pairs of reed contacts, around said pairs of reed contacts, and extending from the ends of said pairs of reed contacts,

a permanent magnet positioned in a selected one of said regions of space near said pairs of reed contacts to form a first series magnetic linkage through said pairs of reed contacts,

an electromagnet including a coil having independent terminals positioned near said permanent magnet and within said selected region of space to enable the formation of a second series magnetic linkage through said pairs of reed contacts,

said reed contacts being biased by said first series magnetic linkage to an open position,



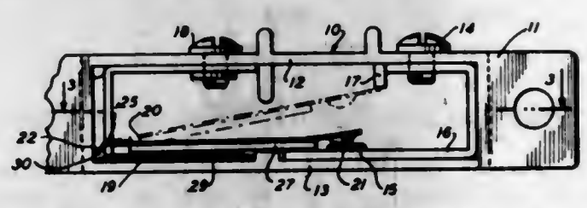
said reed contacts closing in the presence of said second series magnetic linkage induced by a current of a first polarity in said electromagnet, and

said reed contacts remaining open in the presence of said second series magnetic linkage induced by a current of polarity opposite to said first polarity in said electromagnet.

3,273,089
CIRCUIT BREAKER LINKAGE AUXILIARY TRIPPING ARRANGEMENT

Henry P. Franz, Trenton, N.J., assignor to Heinemann Electric Company, Trenton, N.J., a corporation of New Jersey

Filed Apr. 29, 1963, Ser. No. 276,358
5 Claims. (Cl. 335—166)

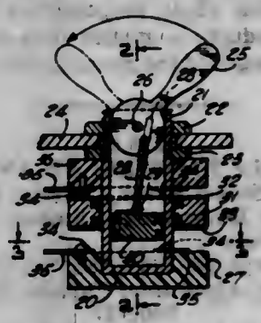


1. In combination, a circuit breaker comprising a case, an automatically resettable linkage for controlling a pair of separable contacts enclosed by said case, said circuit breaker further comprising an electromagnetic means for controlling said linkage, said linkage including a latch releaseable by said electromagnetic means, a spring for automatically resetting said linkage, a trip rod carried by said case, a second spring biasing said trip rod out of engagement with said latch, and said trip rod being movable into engagement with said latch against the bias of said second spring for moving said latch to a position allowing said linkage to collapse and said contacts to open.

3,273,090
MAGNETICALLY OPERATED SWITCH

Jack Malin, Beechhurst, N.Y., assignor, by mesne assignments, to Alarm Device Mfg. Co., a division of Pittsburgh Railway Co., Inc., Carle Place, N.Y., a corporation of Pennsylvania

Filed June 8, 1965, Ser. No. 462,247
4 Claims. (Cl. 335—205)



1. In an electrical switch for connection with an electric circuit to be controlled thereby according to the proximity of the switch to a magnet, a casing for the switch having internal spaced upper and lower walls, a first terminal post on the upper wall of the casing for connection with the electric circuit, a first contact member on the lower wall of said casing and within the casing, connected to said first terminal post, a second terminal post on the casing for connection with an electric circuit, a conductor plate connected to the second terminal and extending to the lower wall, an elongated spring plate member, means pivotally connecting one end of said spring plate member to the lower end of said conductor plate and electrically connecting said end of the spring plate member to said second terminal post, a second contact member on said spring plate member, an armature secured to said spring plate member, biasing means engaging the casing and engaging the armature urging the second contact member carrying portion of the spring plate member for movement relative to the first contact member until the attraction of the armature to a magnet overcomes the said biasing means.

3,273,091
HERMETICALLY-SEALED MANUALLY-ACTUATED MAGNETIC SNAP SWITCH

Nathaniel B. Wales, Jr., New York, N.Y., assignor to The Metrodynamics Corporation, Red Bank, N.J., a corporation of New Jersey

Filed Aug. 19, 1965, Ser. No. 480,891
2 Claims. (Cl. 335—207)

1. A switch comprising:

a cup of non-magnetic material;

a first permanent magnet moveably located within and guided by the wall of said cup;

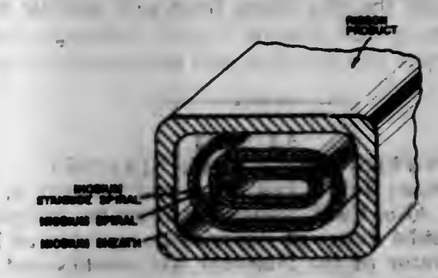
a second moveable permanent magnet surrounding and guided in motion by the wall of said cup;

said first and second magnets being each magnetized parallel to the axis of said cup and in the same direction of polarization;

a bell crank pivoted on an axis transverse to said cup-axis;

link means connecting one of said permanent magnets and said bell crank;

displacement means comprising said bell crank and link to move one of said magnets through a first translational actuating displacement parallel to the axis of said cup;



stop means to limit the motion of the other of said magnets to a second translational actuated displacement less in magnitude than and positioned to be within the first translational displacement; and

said stop means comprising switch contacts for at least one end of said second displacement.

3,273,092
ELONGATED SUPERCONDUCTIVE PRODUCT

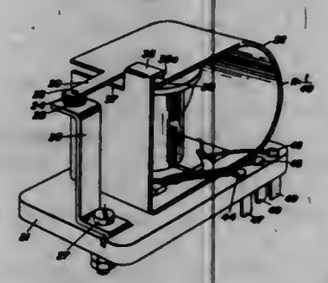
Milo P. Hullihen, Concord, Mass., assignor to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts

Filed Oct. 10, 1963, Ser. No. 315,152
5 Claims. (Cl. 335—216)

1. An elongated superconductive wire product for carrying current along the axial length thereof and useful for such purposes as electromagnetic coils, the elongated product itself consisting essentially of:

(a) an annular metal sheath with a hollow core;

(b) a layer of high-field-superconductive alloy material within the core in the form of a first spiral, the said first spiral layer running through the portion of the current carrying length of the elongated product where current is to be carried superconductively;



(c) a layer of a second material in the core in the form of a second spiral, the turns of the first spiral being interleaved with turns of the second spiral so that turns of the first spiral are separated from each other, the second material being selected from materials which are non-superconducting under conditions of high field; the said elongated wire product being constructed and arranged so that the lateral length of superconductive alloy within the core, as seen in a cross-section plane perpendicular to the axis of the wire product, is greater than the cross section peripheral length of the metal sheath.

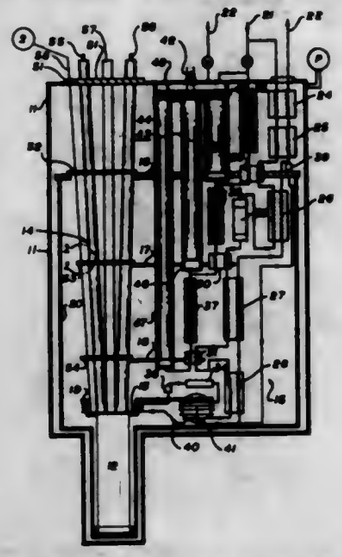
3,273,093

AUTOMOBILE LAMP RELAY AND SYSTEM

Rodney Hayden, Stoney Creek, Ontario, Canada, assignor to United-Carr Incorporated, Boston, Mass., a corporation of Delaware

Filed Sept. 24, 1965, Ser. No. 490,008
Claims priority, application Canada, Sept. 20, 1965, 940,927
7 Claims. (Cl. 335—203)

1. A direct current electrical relay for automobile lamp circuits and the like and comprising: a spring metal obturator formed of a continuous length of spring strip low carbon ferrous material of high hardness having a free arcuate portion extending through substantially 180° of arc between a free arm portion extending tangentially therefrom and forming a part thereof and a base portion forming a part thereof and terminating in a bracket arm extending to said arm portion and providing a flange part adapted to restrain said arm from outward springing under the inherent spring tension of said strip material; an insulate base; an electro-magnetic coil; means mounting said base portion on said insulate base with said coil in assembly therewith within the bracket arm arcuate portion, arm, and base portion of said obturator and spacing said coil a predetermined distance from said free arm portion; an electrical contact on the free end of said arm portion; and a second electrical contact including support means therefor rising from said insulate base in normal open spaced relation thereto defining a normally open contact gap less than said predetermined spacing.



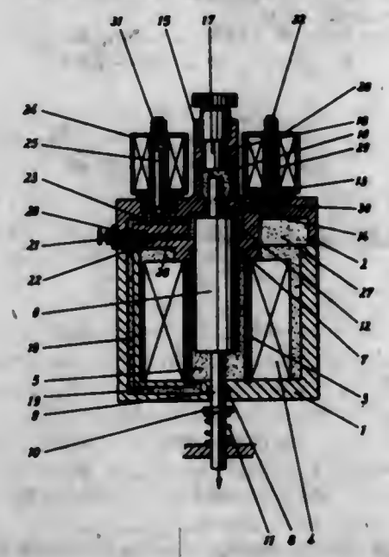
3,273,094

SUPERCONDUCTING MAGNET

William Pinkney Jones, Los Altos, and William A. Peterson, Palo Alto, Calif., assignors, by mesne assignments, to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration

Filed May 28, 1964, Ser. No. 370,989
5 Claims. (Cl. 335—216)

1. A magnet assembly including: a vacuum envelope; a mounting flange supported within said envelope; means for cooling said flange; and magnet coils mounted from said flange, said coils including a plurality of turns of superconducting wire establishing a magnetic field within said vacuum envelope when cooled to a temperature below the critical temperature of said wire and conducting electrical current, said wire covered with a layer of electrically and thermally conductive metal operative to con-



duction cool said superconducting wire and to simulate the magnetic properties of said magnet when current is passed through said metal at temperatures above said critical temperature and a layer of electrically, substantially non-conductive material covering said layer of conductive metal and electrically insulating adjacent turns of said magnet.

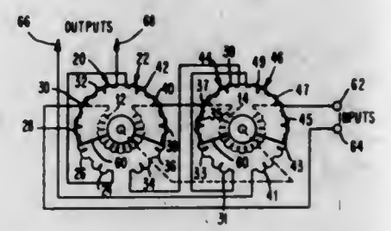
3,273,095

ELECTROMAGNETIC CONTROL MECHANISM, ESPECIALLY FOR REGULATING VALVES

Heinz Rossenbeck, Stuttgart-Bad Cannstatt, Germany, assignor to Concordia Maschinen- und Elektrizitats G.m.b.H., Stuttgart-O, Germany

Filed Nov. 3, 1964, Ser. No. 408,568
Claims priority, application Germany, Nov. 8, 1963, C 31,348
9 Claims. (Cl. 335—239)

1. An electromagnetic control mechanism, primarily for operating and controlling a regulating valve, comprising a closed housing, field coil in said housing, an armature in said housing, a return spring acting upon said armature, said armature being adapted to move in its axial direction against the action of said return spring when said field coil is energized, connecting means on one end of said armature for connecting the same to an



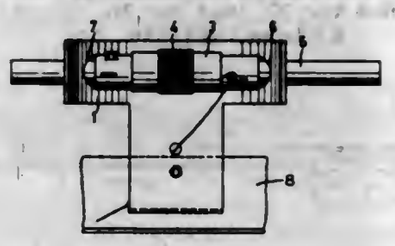
element to be moved and controlled thereby, a pair of fluid-displacement chambers within said housing at the opposite ends of said armature, a control line connecting said chambers with each other, a throttle valve within said control line, means for manually adjusting said throttle valve from the outside of said housing for varying the rate of flow of a pressure fluid through said control line, a by-pass line also connecting said chambers with each other and bypassing said throttle valve; said chambers, said control line, and said by-pass line adapted to be filled with said pressure fluid, and an electromagnetic control valve for opening and closing said by-pass line, said armature projecting with its opposite ends into said chambers and being adapted when moved in one direction to move with one end more deeply into a first of said chambers and with its other end farther out of the second chamber so as to convey said pressure fluid from said first chamber to said second chamber through said control line and said throttle valve when said control valve is closed and also through said by-pass line and said control valve when said control valve is open.

3,273,096

ROTARY DIFFERENTIAL TRANSFORMER

Joseph Lipshutz, Philadelphia, Pa., assignor to Schaevitz Engineering, a corporation of New Jersey

Filed Mar. 25, 1964, Ser. No. 354,549
3 Claims. (Cl. 336—30)



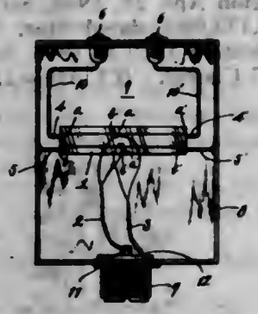
1. A rotary differential transformer comprising a primary winding disposed about a common axis, a pair of secondary windings connected in bucking relationship with respect to each other, each of said secondary windings including a plurality of coils each having an axis substantially parallel to said common axis, and a movable element providing magnetic coupling between said primary and secondary windings to produce an output signal corresponding to the movement of said movable element.

3,273,097

ADJUSTABLE ANTENNA ROD AND SUPPORT ASSEMBLY

Johannes A. Koster, Scarborough, Ontario, Canada, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed May 21, 1964, Ser. No. 369,238
Claims priority, application Canada, July 3, 1963, 879,245
6 Claims. (Cl. 336—65)



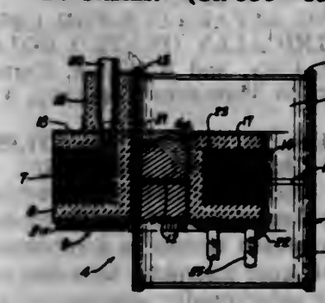
1. A clamping assembly for an adjustable inductor having an axially movable elongated core and coil means encircling said core; said assembly comprising a sheet of resilient insulating material having a pair of spaced apart openings therein for receiving said elongated core in a bowed position of said sheet and securing said core against longitudinal movement with respect to said sheet, said sheet enclosing said coil means within the bowed portion thereof between said openings, the space between said openings being selected for simultaneously contacting both axial ends of said coil means to secure it against longitudinal movement on said core.

3,273,098

HIGH FREQUENCY MATCHING TRANSFORMER

Goichi Saito, 15-2, 3-chome, Toshima, Kita-ku, Tokyo, Japan

Filed June 1, 1964, Ser. No. 371,640
2 Claims. (Cl. 336—69)



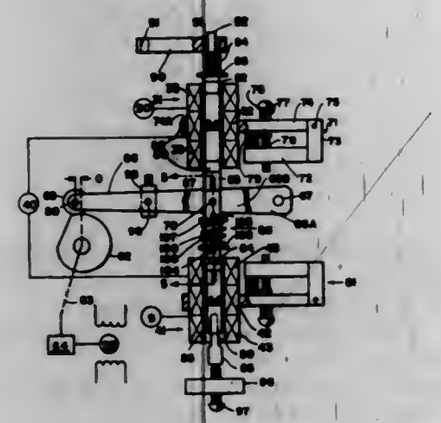
1. A high frequency matching transformer comprising
a bobbin,
a pair of bifilar coils on said bobbin,
one of said bifilar coils extending from the center to a first end of said bobbin,
the other of said bifilar coils extending from the center to a second end of said bobbin,
a metal box having a pair of terminals at one end of said box,
a two-terminal connector at the other end of said box,
first and second conductive leads connecting one coil of each bifilar pair of said metal box,
third and fourth conductive leads connecting the other coil of each bifilar pair to conductive arms, extending parallel to the walls of said box and connecting said terminals on said box, and
two extension wires extending from each coil of said bifilar pair at the center of said bobbin to different terminals of said two-terminal connector.

3,273,099

TRANSFORMER

Floyd M. Minks, Chester, N.H., assignor to Kiekhaefer Corporation, Fond du Lac, Wis., a corporation of Delaware

Filed June 15, 1964, Ser. No. 374,925
14 Claims. (Cl. 336—83)

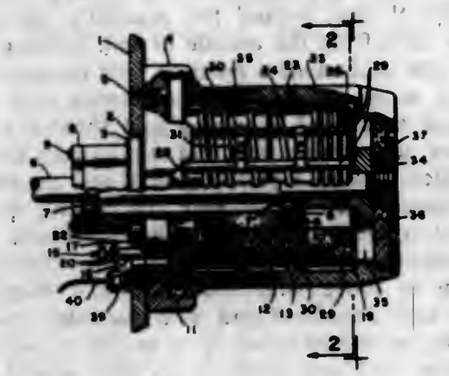


1. A transformer structure comprising,
a magnetic core unit having a winding opening and an adjacent magnetic winding portion,

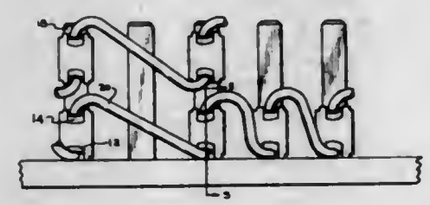
a secondary winding insulator of a high voltage insulating material encircling the core unit winding portion at the opening and having a secondary winding groove within the insulator and opening generally outwardly of the winding portion,

a secondary winding within the groove and having a high voltage terminal at the base of the groove, and

a primary winding means encircling a portion of the core unit immediately adjacent at least one side of the winding insulator.



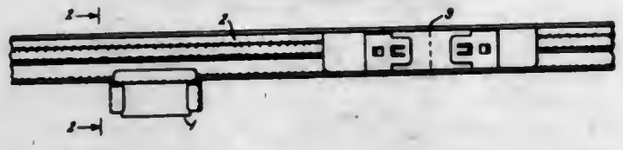
3,273,100
PLURAL MOVABLE CORE TRANSFORMER ASSEMBLY WITH ESCAPEMENT MEANS
Otto Muller-Girard, Rochester, N.Y., assignor to Taylor Instrument Companies, Rochester, N.Y., a corporation of New York
Original application Apr. 29, 1960, Ser. No. 25,637, now Patent No. 3,173,003, dated Mar. 9, 1965. Divided and this application Dec. 8, 1964, Ser. No. 423,409
7 Claims. (Cl. 336—131)



1. A core assembly for a variable transformer arrangement including a pair of transformers, each having a movable core and a plurality of windings inductively coupled together to a degree depending on the position of said core relative thereto, said core assembly comprising a pair of cores coupled together for simultaneous movement of both in consequence of motion applied to either core, and escapement means mechanically coupling said cores, said escapement means including a resilient member and a pair of elements, one on each core, said resilient member being supported between said elements and so arranged as to oppose movement of one of said elements toward the other of said elements, whereby motion of one of said elements is transmitted via said resilient member to the other of said cores.

3,273,101
HEATING APPARATUS FOR USE IN ELECTRICALLY HEATED ROLLS
Sam W. Burdge, Cary, and Rollins S. Carter, Durham, N.C., assignors to Monsanto Company, a corporation of Delaware
Filed Dec. 18, 1963, Ser. No. 331,555
5 Claims. (Cl. 338—316)

2. A heating apparatus for use in electrically heated rolls comprising a spool-shaped core assembly, electrical resistance heater means wound in a substantially helical fashion about said core assembly, fastening means operative to maintain substantially equi-spaced points along said heater means fixed relative to said core assembly, said fastening means comprising pairs of superposed electrical insulating strips spaced circumferentially about said core assembly and extending axially thereof, said heater means extending between the member strips of each of said pairs, means to clamp said strips to said core assembly, whereby thermal expansion of said heater element is effectively and uniformly segmented and caused to be uniformly distributed about the entire circumference of said core assembly.



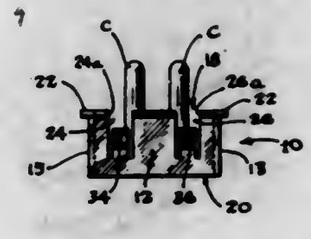
3,273,102
SERIES ELECTRICAL CONNECTIONS
Robert Franklin Cobaugh, Hershey, Pa., assignor to AMP Incorporated, Harrisburg, Pa.
Filed Aug. 17, 1965, Ser. No. 480,442
2 Claims. (Cl. 339—18)

1. A series electrical hook-up among a plurality of terminal posts, said posts being straight and having a uniform cross-section throughout their lengths, said hook-up comprising a conductor having a clip-type electrical connection with each of said posts, the clips of said electrical connections having a web portion disposed against one side of the associated terminal post and having outwardly deformed portions at each end of the web, said conductor, in each electrical connection, extending through the outwardly deformed portion which is adjacent to the base of the post, thence axially along a surface of the post and between said surface and said web, and emerging from confined relationship through the outwardly deformed portion of said web which is remote from the base of the post.

3,273,103
POLARIZING MEANS FOR BUSWAY PLUG
Eric A. Ericson, Plainville, Conn., assignor to General Electric Company, a corporation of New York
Filed Apr. 27, 1964, Ser. No. 362,693
8 Claims. (Cl. 339—22)

1. A branch plug-in device for attachment to a busway comprising a housing having longitudinally extending base flanges spaced apart to provide an open slot therebetween

and having spaced apart longitudinally extending busbars within said housing accessible through said slot, one of the longitudinal edges of one of said flanges and the corresponding longitudinal edge of the other of said flanges being unequally distant from the longitudinal central plane of said housing, said plug-in device comprising:



(a) an insulating body provided with a pair of stab contacts for engagement with a preselected pair of said bus bars and having a base for mounting said contacts,

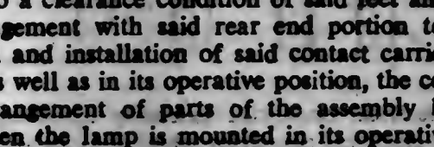
(b) a polarizing plate having upturned opposite lateral flanges disposed on said base with its lateral flanges in position for engaging the outside longitudinal edges of said base flanges of said housing,

(c) means for selectively securing said polarizing plate in either a first or a second position on said base, and

(d) indicating means in cooperative relationship with said securing means for providing an indication of the position in which said polarizing plate is secured.

3,273,104
ELECTRICAL CONNECTOR UNIT WITH SNAP-IN FASTENER MEANS
Stanley J. Krol, Chicago, Ill., assignor to United-Carr, Incorporated
Filed July 21, 1964, Ser. No. 384,116
1 Claim. (Cl. 339—128)

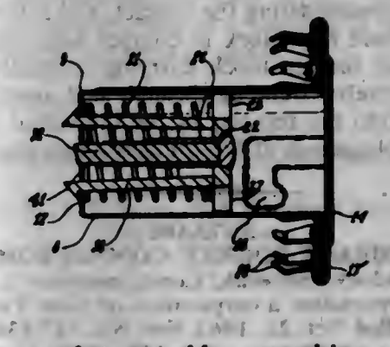
An electrical connector unit comprising an insulating body member having opposed spaced side walls and opposed spaced end walls, said side walls and end walls defining a hollow wall portion having upper and lower open faces, said side walls adjacent said upper open face having opposed slots therein terminating at points spaced from said lower open face, an outwardly extending flange integral with said side walls and said end walls adjacent said open face, flexible ear elements integrally joined to said side walls and disposed for flexible movement within said slots, the outermost end of each of said ears being spaced from the plane of said flange thereby to engage the opposite surface of a supporting panel from said flange, said body member having a contact supporting element bridging the space between said end walls and integral with said end walls at points intermediate said upper and lower faces, said contact supporting element being spaced from said ear elements to permit flexure of said ear elements into and out of said hollow wall portion, and metal contact members carried by said contact supporting element.



3,273,105
PLUG-JACK CONNECTOR
Stephen L. Klassen, Saddle Brook, N.J., assignor to Thermo Electric Co., Inc., Saddle Brook, N.J., a corporation of New Jersey
Filed May 5, 1964, Ser. No. 364,948
7 Claims. (Cl. 339—176)

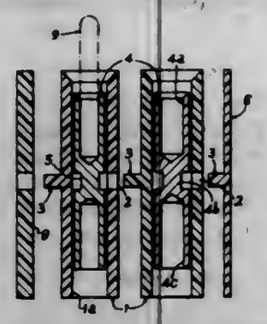
1. A connector jack comprising,

(a) a housing of insulating material formed of two matching housing sections removably secured together,



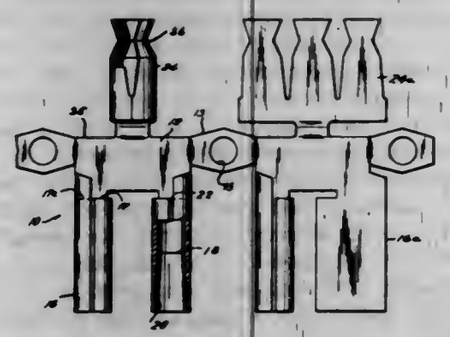
(b) means forming a pair of spaced openings in one end of the housing,

(c) a pair of flat contact strips carried by one housing section and longitudinally aligned with said openings, and



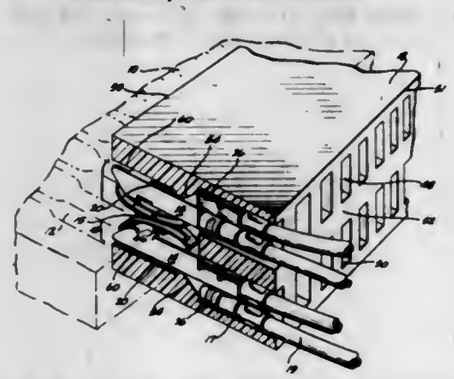
(d) a pair of leaf springs carried by the other housing section and longitudinally aligned with the said contact strips, each leaf spring being bent transversely to form axially-spaced convex portions, which convex portions are spaced a predetermined distance from an associated one of said contact strips.

3,273,106
BAYONET-TYPE LAMP SOCKET ASSEMBLY
Herbert Roy Martin, Glen Waverley, Victoria, Australia, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 26, 1963, Ser. No. 326,271
Claims priority, application Australia, Apr. 19, 1963, 29,682/63
8 Claims. (Cl. 339—188)



1. A lamp socket assembly, comprising a housing, a compression spring means within said housing, a contact carrier member which incorporates rearwardly extending retaining means specifically including at least a pair of axially diverging resilient legs having at their free ends outward feet each of which in its operative position engages the rear end portion of said housing under the action of said compression spring means which acts to urge said contact carrier member towards the open front end of the housing, said retaining means including said feet and legs being displaceable from its operative position into a clearance condition of said feet and legs free of engagement with said rear end portion to facilitate removal and installation of said contact carrier member from, as well as in its operative position, the construction and arrangement of parts of the assembly being such that when the lamp is mounted in its operative position the contact carrier member is moved rearward bodily against the reaction of said compression spring means thus disengaging said retaining means including both said feet and legs clearly spaced away from said rear end portion, whereas when the lamp is removed, the contact carrier member is moved forward bodily under the action of said compression spring means an axial distance positively limited by automatic re-engagement of said retaining means centralized axially by said legs again with said feet against said rear end portion, thus hindering the possibility of said contact carrier member being unintentionally ejected bodily through the open front end of the housing when the lamp is removed, said feet and legs both engaging said rear end portion during the condition of lamp removal.

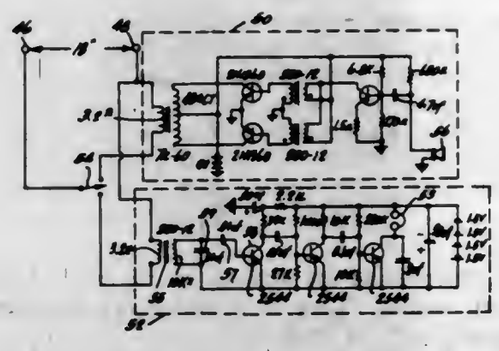
3,273,107
PLUG-AND-SOCKET CONNECTORS
Walter Chandler, Theydon Bois, Essex, England, assignor to Plessey (U.K.) Limited, Ilford, England, a British company
Filed Jan. 16, 1964, Ser. No. 338,258
Claims priority, application Great Britain, Jan. 25, 1963, 3,199/63
5 Claims. (Cl. 339—198)



1. A plug-in type electric connector member, comprising a first block made of insulating material and having a plurality of parallel through bores and a side face parallel to said bores, connector contacts respectively accommodated in said bores for at least part of the length of each contact, the block having apertures respectively extending into said bores from said side face, and each contact having a surface recess facing such aperture associated with the bore accommodating the contact, and a further block, secured to said first block in contact with said side face thereof, said further block carrying mutually insulated pegs respectively extending through said apertures of the first block into the recesses of the individual contacts to restrain displacement of the contacts along the said bores.

3,273,108
IMPACT SOCKET CONNECTOR
Ernest Radocy, Norwalk, Conn., assignor to Burndy Corporation, a corporation of New York
Filed Oct. 21, 1963, Ser. No. 317,536
2 Claims. (Cl. 339—210)

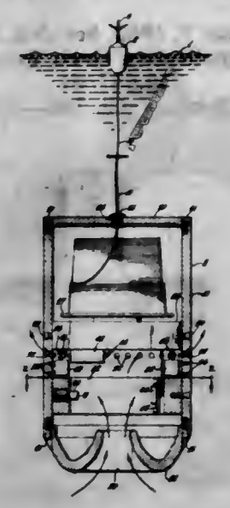
1. An electrical connector assembly including a tapered socket electrical connector which may be simply and economically formed by arcuately bending and rolling into tubular shape a unitary piece of substantially flat sheet metal having a portion of uniformly varying thickness, comprising:
a housing member of dielectric material including two parts abutting at a common interface;
a socket contact member including at a forward end thereof a tubular body portion of rolled sheet stock characterized by a pair of longitudinally extending substantially opposed edges;
said body portion having a cylindrical outer surface of substantially uniform diameter, wherein the thickness of said sheet stock varies uniformly from a given value proximate one end of said tubular body to a lesser thickness at the other end thereof, thereby defining a conically tapered interior surface within said body portion for receiving a taper pin connector in force fit relationship;
said socket contact member further including at a rearward end thereof an electrical connection portion;
one part of said housing member having a cylindrical bore therethrough for receiving said tubular body portion therein, and the remaining part of said housing member having an opening therein for receiving said electrical connection portion;
said socket contact member still further including a shoulder thereon substantially intermediate the forward and rearward ends thereof for engaging said housing member to transmit thereto rearwardly directed forces applied to said tubular body portion during insertion of a taper pin contact therein.



3,273,109
ELECTRICAL CONNECTOR
Norbert L. Moulin, Placentia, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed Jan. 20, 1964, Ser. No. 338,805
5 Claims. (Cl. 339—217)

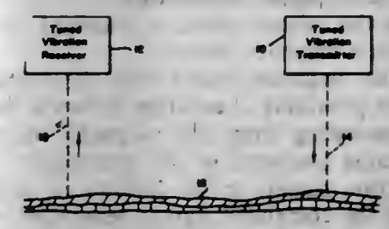
1. An electrical connector comprising:
a connector block including at least one transverse chamber having first, second and third portions and a divider separating said first and second portions, said first and second portions each having a retaining shoulder and said third portion having a pair of spring locking grooves; and
a pair of juxtaposed single piece contact members each positioned in a differing one of said first and second portions each of said members including a pair of elongated side walls each having a lanced section, a pair of electrical conductor pin receiving and locking springs, one of which engages said shoulder, a locking spring engaging one of said grooves and a double leaf contact spring extending into said third portion and having a curved extremity engaging said lanced sections whereby said pair of contact members defines a passage adapted to receive a flat conductor and to contact opposite surfaces thereof.

3,273,110
UNDERWATER COMMUNICATION SYSTEM
Harold Richard Monroe, Santa Ana, and Vadim N. Erdman, Los Angeles, Calif., assignors to Douglas Aircraft Company, Inc., Santa Monica, Calif.
Filed Mar. 2, 1964, Ser. No. 348,614
3 Claims. (Cl. 340—4)



1. A communication system for a station disposed in a conductive medium, said system including a receiver circuit comprising:
an impedance matching input transformer having an input winding and an output winding, said input transformer having an impedance ratio of more than 1 to 1000 and having said input winding adapted to be connected to a pair of spaced probes disposed in the conductive medium;
a first capacitor connected across said output winding, for dissipating signals of higher than audio frequency whereby broadcast signals and the like are generally dissipated;
a first transistor amplifier stage including a first transistor connected in a first common emitter amplifying circuit having a base-emitter input and a collector-emitter output, said first transistor having a floating, non-direct current biased base whereby input signals to said base of said first transistor are not loaded down by a bias resistor;
a second capacitor connected in series between one side of said output winding and said base of said first transistor, the other side of said output winding being connected to said emitter of said first transistor whereby the high impedance side of said input transformer is connected to said base-emitter input of

said first amplifier stage and low frequency hum signals and the like are blocked from said base of said first transistor;
second and third transistor amplifier stages including second and third transistors connected in respective second and third common emitter amplifying circuits which are connected in series, said second amplifier stage being connected to said collector-emitter output of said first amplifier stage, and said second and their transistors having respective direct current biased bases;
sound reproducing means for converting electrical signals received by said pair of spaced probes into audio sounds; and
means connecting said third amplifier stage to said sound reproducing means for driving the same,
whereby a highly efficient and effective interference-free received circuit for communication within a conductive medium is obtained.

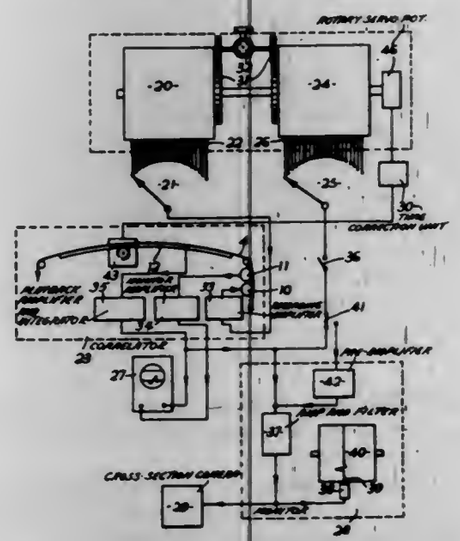


3,273,111
APPARATUS FOR MEASURING THE VELOCITY OF ACOUSTICAL WAVES
William C. Parenti, Philadelphia, Pa., assignor to American Bosch Arma Corporation, Philadelphia, Pa., a corporation of New York
Filed Aug. 3, 1964, Ser. No. 386,890
9 Claims. (Cl. 340—5)

1. Apparatus for measuring the velocity of acoustical waves in a fluid medium, comprising:
an electro-acoustical transducer mechanically coupled to a fluid medium transmissive of acoustical energy;
pulse generating means for generating a series of time-spaced electrical pulses and for applying them to said transducer to launch a series of correspondingly time-spaced acoustical pulses into said fluid medium;
a convex reflector of acoustical energy;
spacer means mounting said reflector in said fluid medium at a predetermined distance from said transducer and in the path of said acoustical pulses so as to reflect only a limited portion of the energy of each of said acoustical pulses from the convex surface of said reflector back to said transducer after the electrical pulse producing it is ended, thereby to produce

an electrical control pulse from said transducer upon reception of each of said pulses of reflected energy by said transducer; and
circuit means responsive to each of said control pulses for controlling the time of generation of the next succeeding electrical pulse of said series.

3,273,112
TUNED SEISMIC WAVE COMMUNICATION SYSTEM
Leland S. Hobson, 508 Wickham Road, Manhattan, Kans.
Filed Dec. 3, 1962, Ser. No. 241,704
1 Claim. (Cl. 340—15)



A communications system utilizing the earth's crust as the transmitting medium comprising in combination
(a) a generator for producing physical vibrations at a predetermined frequency selected to be capable of transmission through said transmitting medium;
(b) coupling means connecting said predetermined frequency vibration generator to said transmitting medium at a first position;
(c) a receiver tuned to be sympathetic to said predetermined frequency vibrations, said receiver comprising a reed member mounted and tuned to be resonant to said predetermined frequency, a coil mounted to move with said reed, means providing a magnetic field at said coil, said magnetic field having sufficient strength to produce an alternating current signal in said coil in response to vibration of said reed, and means for detecting the alternating current in said coil; and
(d) coupling means located at a second position remote from said first position connecting said receiver to said transmitting medium for transmitting said predetermined frequency vibrations from said transmitting medium to said receiver.

3,273,113

METHODS OF AND APPARATUS FOR MEASURING THE TRAVEL TIMES OF VIBRATIONS IN THE EARTH'S CRUST

William E. Lerwill, Keston, and Nigel A. Anstey, Chelsfield, England, assignors, by mesne assignments, to Continental Oil Company, Ponca City, Okla., a corporation of Delaware

Filed May 7, 1962, Ser. No. 192,669
Claims priority, application Great Britain, May 8, 1961, 16,687/61
6 Claims. (Cl. 340—15.5)

1. A method of measuring the travel times of a seismic signal, comprising the steps of:

transmitting a seismic signal of known frequency content through the earth from a first point to a second point;

providing a magnetic head transducer having a plurality of conducting elements arranged in a configuration which can be equated to the frequency of the seismic signal transmitted;

recording the seismic signal as received at the second point on a magnetic record;

passing the magnetic record over the transducer in a relation providing a coaction between the magnetic flux emanating from the magnetic record and the conducting elements of the transducer to generate correlation signals in the transducer; and

recording the correlated signals generated in the transducer on a time basis relative to the time of transmission of the seismic signal from the first point, whereby the travel times of the seismic signal may be measured.

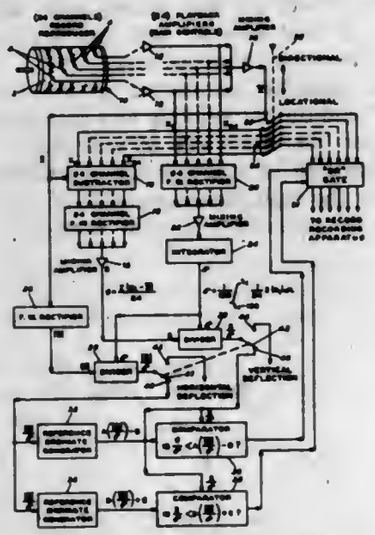
3,273,114

ERGODIC SIGNAL PICKING

Lee P. Stephenson and Walter W. Klein, Fullerton, Calif., assignors to Chevron Research Company, a corporation of Delaware

Filed Aug. 2, 1963, Ser. No. 299,601
12 Claims. (Cl. 340—15.5)

1. The method of processing a seismic record, composed of a plurality of seismic traces, to designate a part of the record that contains a meaningful signal, as distinguished from unmeaningful noise, comprising the steps of:



(a) measuring a time-average, across-trace-average, absolute amplitude characteristic of at least a portion of the record in the neighborhood of a particular instantaneous part of the record under examination,

(b) measuring at said particular instantaneous part of the record an across-trace-average amplitude,

(c) measuring at the same said particular instantaneous part of the record an across-trace-average absolute amplitude deviation characteristic,

(d) producing a first signal representing the ratio of said across-trace-average amplitude to said time-average, across-trace-average, absolute amplitude characteristic,

(e) producing a second signal representing the ratio of said across-trace-average absolute amplitude deviation characteristic to said time-average, across-trace-average, absolute amplitude characteristic,

(f) determining the position of the pair of said first and second ratios in a probability distribution of many pairs of such ratios,

(g) and designating said particular instantaneous part of the record as containing a meaningful signal if the position of said paired ratios lies in a region of said probability distribution of many paired ratios in which it would not probably lie due to chance alone.

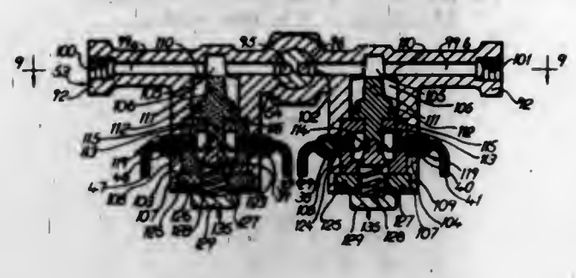
3,273,115

TRAFFIC LIGHT SYSTEM

Paul Lafon, Le Perreux, France, assignor to Societe Anonyme dite: Compagnie des Freins et Signaux Westinghouse, Paris, France

Filed Feb. 21, 1966, Ser. No. 528,907
Claims priority, application France, Feb. 23, 1965, 6,607
6 Claims. (Cl. 340—41)

1. A road traffic light system comprising a translucent strip, means for mounting said strip in a carriageway at right angles thereto, a plurality of coloured lights, means for mounting said lights beneath said strip, and automatically operable control means for energising said lights cyclically in dependance upon traffic requirements.



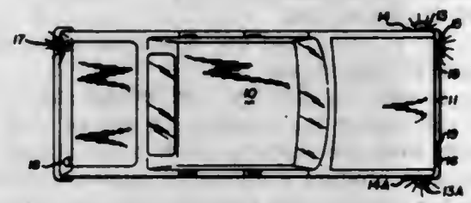
3,273,116

SAFETY SYSTEM FOR HYDRAULIC BRAKES

Alejandro Martínez Quirós and Ramón Martorell Adzeries, Barcelona, Spain; said Quirós assignor to Anthonio J. Gijon and Alejandro Martínez Fornaguera

Filed Mar. 11, 1963, Ser. No. 264,198
3 Claims. (Cl. 340—60)

1. In an automobile having a plurality of brake shoes, cylinders for said brake shoes, separate conduits supplying a brake fluid to said cylinders for actuating said brake shoes, and a pedal-operated pump for transmitting the brake fluid to said cylinders, a safety device comprising a hollow body having a central portion and tubular portions connected with said central portion, said central portion being directly connected with said pump, each tubular portion having an end connected to a separate conduit for transmitting brake fluid from said pump to that conduit, a separate cylindrical projection integral and communicating with each tubular portion, separate pistons movable within said projections and contacted by the brake fluid on only one face thereof, and separate springs engaging said pistons, each of said springs being adapted to press the piston engaged thereby into the tubular portion and automatically interrupt communication between said pump and one of said conduits when there is drop in pressure of the brake fluid therein.



3,273,117

SIGNAL LIGHTS FOR MOTOR VEHICLES

Stanley Martauz, 81 Camvet Drive, Campbell, Ohio

Filed Sept. 30, 1963, Ser. No. 312,398
3 Claims. (Cl. 340—81)

1. A signal light system for a motor vehicle and including spaced red and green signal lights, each respectively on the left and right sides of the rear of the vehicle, and spaced red and green signal lights on the left and right of the front of the vehicle and a pair of spaced red and green signal lights on each side of the vehicle adjacent the front thereof, an energizing circuit for selectively illuminating either said red signal lights or said green signal lights to respectively indicate a turn to the left or to the right, said red and green signal lights being individually positioned and horizontally spaced.

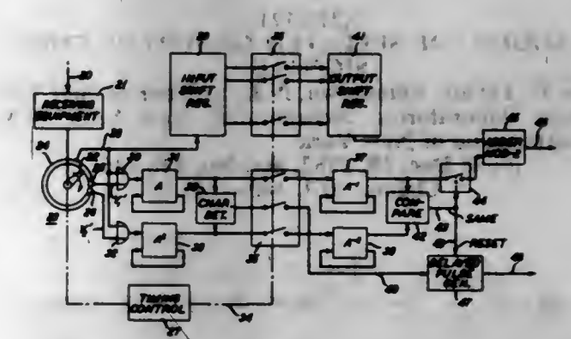
3,273,118

ACCIDENT ILLUMINATING DEVICE

Charles E. Hendershot, Nashville, Ind., assignor, by direct and mesne assignments, to Nitehawk, Inc., Zionsville, Ind., a corporation of Indiana

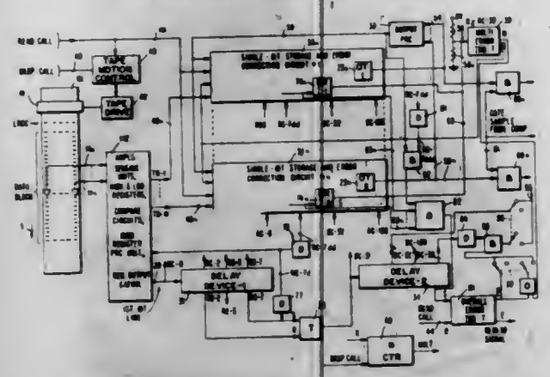
Filed Dec. 10, 1962, Ser. No. 243,324
5 Claims. (Cl. 340—89)

1. An accident illuminating device for use with an automobile, said device comprising a red transparent dome; a base; a first light socketed therein and projecting upwardly therefrom; a second light socketed therein and projecting downwardly therefrom; said dome being secured to said base, projecting upwardly therefrom and enclosing said first light; a frusto-conical reflector secured about said base and opening downwardly; a transparent cylinder threaded into said base and projecting downwardly therefrom and from within said reflector, said cylinder enclosing said second light; a flexible elongated tube having one end received about the lower end of said cylinder; means clamping said tube in airtight relation to said cylinder; said cylinder having a closed bottom which closes off the upper end of said tube, and means clamping off the lower end of said tube.



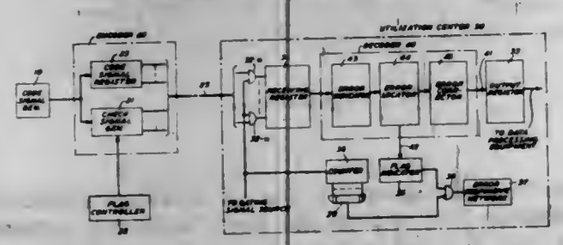
3,273,119

DIGITAL ERROR CORRECTING SYSTEMS



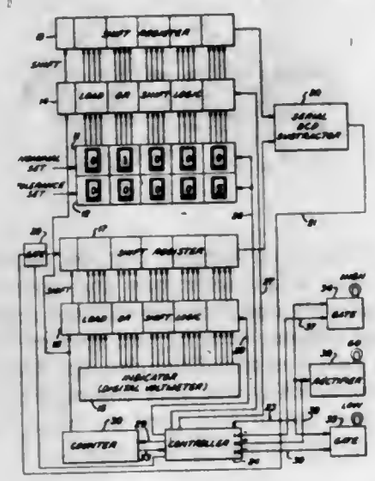
Harry A. Helm, Morristown, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Aug. 21, 1961, Ser. No. 132,925
24 Claims. (Cl. 340—146.1)



3. In combination, a source of multidigit information characters, first and second linear sequential networks, each said first and second networks including means for linearly operating upon and iteratively combining said information characters to form first and second check characters, means for associating said first and second check charcters with the corresponding information characters, third and fourth linear sequential networks for repeating the operation of said first and second networks on said information characters and said check characters, fifth and sixth linear sequential networks, each said fifth and sixth networks including means for inversely operating upon the outputs of said third and fourth networks, and means responsive to the outputs of said fifth and sixth networks for correcting errors in any symbol in the associated information characters.

3,273,120
ERROR CORRECTION SYSTEM BY RETRANSMISSION OF ERRONEOUS DATA
Donald R. Dustin, Salt Point, Robert V. McFadden, Wappingers Falls, Charles P. Rauf and Gilbert G. Unger, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 24, 1962, Ser. No. 246,707
10 Claims. (Cl. 340—146.1)

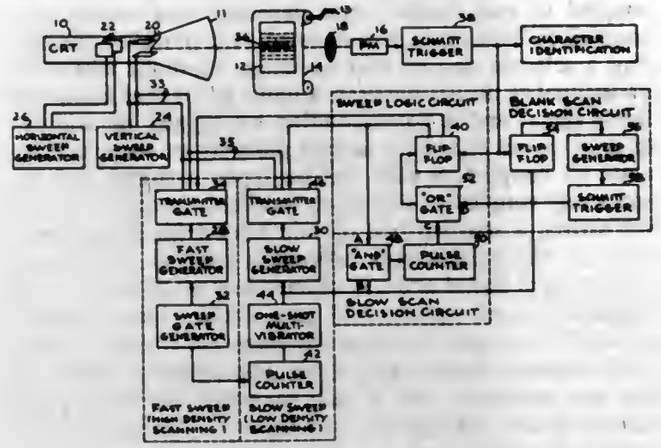


1. A system for correcting a digital data output read from tape comprising:
means for determining the existence of an error in the reading of a tape data block,
means for retaining a track-error identification for each tape track in said block for errors found during a preceding reading,
means for rereading said tape block in response to the detection of an error in said block during the prior reading,
means for registering each byte read from the block,
error-detection means for checking each byte received by said registering means,
gating means connected to and actuated by said registering means for reinserting a bit in any respective track output having an error indicated therein by said retaining means prior to the reception of the next byte by said registering means.

3,273,121
FLAGGING OF SELECTED GROUPS OF CODE SIGNALS
Frank F. Taylor, Eatontown, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 28, 1962, Ser. No. 248,146
7 Claims. (Cl. 340—146.1)

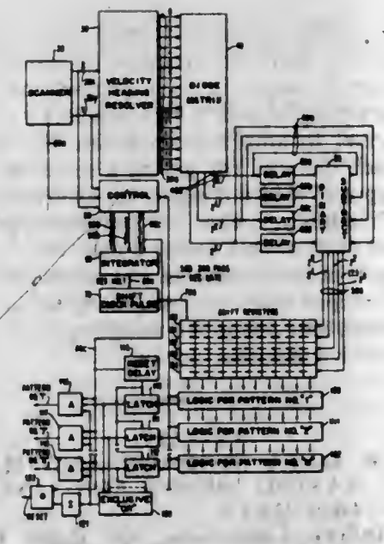
1. Apparatus for flagging code signals, which comprises
means for generating data signals occupying n sequential bit positions,
means for generating a flag control signal occupying an $n+1$st bit position,
means responsive to the first and second named generating means for generating check signals which are capable of indicating an error in any one of the $n+1$ bit positions occupied by said data signals and said flag control signal, and
means for decoding said data signals occupying said n bit positions, and checking said data signals by said check signals,
whereby an error indicated in the $n+1$st bit position of the decoded signals indicates that said data signals have been flagged by said flag control signal.

3,273,122
DIGITAL COMPARATOR
Gerald F. Chandler, La Mesa, Calif., assignor to Cohu Electronics, Inc., San Diego, Calif., a corporation of Delaware
Filed Feb. 19, 1964, Ser. No. 346,002
11 Claims. (Cl. 340—146.2)



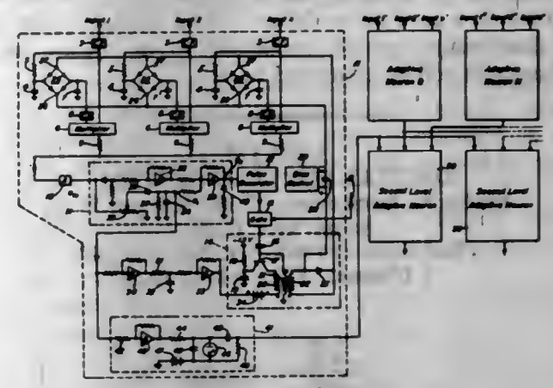
1. A system for determining if a test numerical value differs from a nominal numerical value by less than a predetermined acceptable tolerance, comprising:
first storage means;
means for entering said nominal numerical value into said first storage means;
second storage means;
means for entering said test numerical value into said second storage means;
means coupled to said first and second storage means for subtracting the contents of one of said storage means from the contents of the other of said storage means to produce a difference numerical value;
means for entering said tolerance into one of said storage means; and
means for entering said difference numerical value into the other of said storage means;
said subtracting means again subtracting the contents of one of said storage means from the contents of the other of said storage means to produce a second difference numerical value, the polarity of which indicates whether said test numerical value is within said acceptable tolerance.

3,273,123
CHARACTER RECOGNITION APPARATUS AND METHOD
Gabriel E. Lowitz, Canoga Park, Calif., assignor to Thompson Ramo Wooldridge Inc., Canoga Park, Calif., a corporation of Ohio
Filed May 2, 1962, Ser. No. 191,867
5 Claims. (Cl. 340—146.3)



1. Apparatus for recognizing a character in a line of text extending in a first direction including;
a scanning means;
first means for moving said scanning means relative to said line of text in said first direction at a constant rate;
second actuatable means for moving said scanning means through a finite distance in a second direction extending perpendicular to said first direction;

first actuating means operable to actuate said second actuatable means at a high rate;
second actuating means operable to actuate said second actuatable means at a low rate;

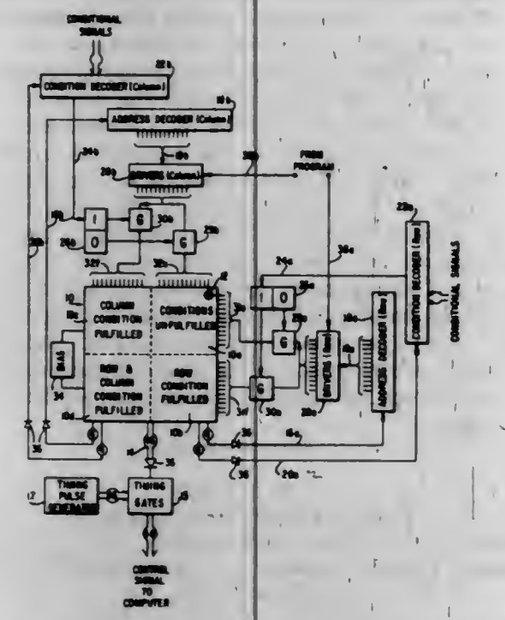


means responsive to said scanning means intercepting said character for subsequently operating said second actuating means and rendering said first actuating means inoperative; and
means responsive to said scanning means not intercepting said character for subsequently operating said first actuating means and rendering said second actuating means inoperative.

3,273,124
ROTATION AND SIZE INVARIANT SHAPE RECOGNITION APPARATUS
Evon C. Greanias, Chappaqua, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 8, 1964, Ser. No. 381,134
5 Claims. (Cl. 340—146.3)

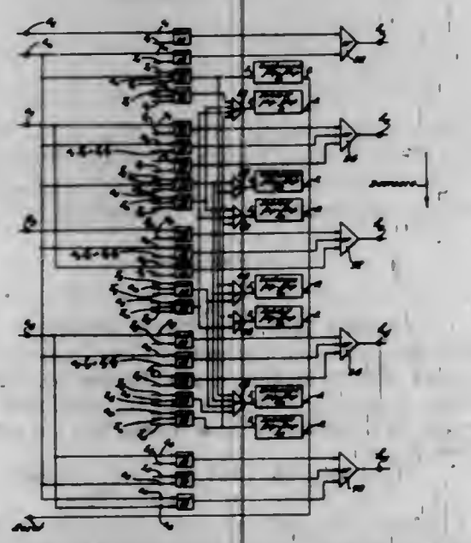
1. A shape identification apparatus comprising:
(a) follower means for following the outline of an unknown shape and producing time variant analog waveforms manifestive of the configuration of the shape;
(b) means for processing said waveforms to produce a succession of binary numbers manifestive of the successive directions of movement of said follower means in following the outline of the shape in a closed trace thereof;
(c) means for obtaining the difference of successive pairs of said binary numbers to produce a succession of binary words equal to the binary difference and the algebraic sign of the differences, each of said pairs of binary numbers including one number from the preceding pair and occurring at predetermined fixed time intervals during the follower action;
(d) means responsive to the peripheral length of the shape being followed for sampling the succession of binary words at time intervals, the duration of which is a linear function of the periphery of the shape;
(e) means for comparing the sampled words with a stored succession of words defining all of the known shapes among which recognition is sought; and
(f) means for precessing the sampled succession of words with respect to the stored succession of words to correct for angular orientation of the unknown shape.

3,273,125
SELF-ADAPTING NEURON
Charles V. Jakowatz, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed Aug. 22, 1961, Ser. No. 133,185
20 Claims. (Cl. 340—172.5)



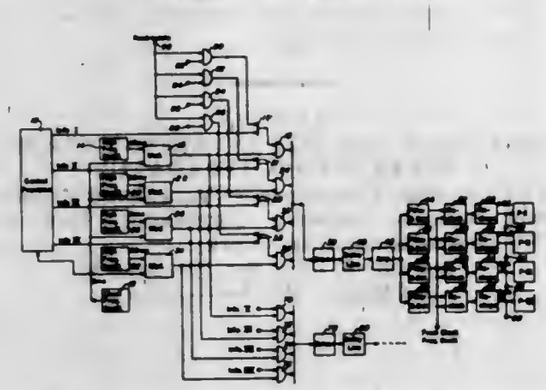
20. An artificial neuron comprising input means for receiving input values, means for integrating said input values, and output means for producing an output whose frequency is indicative of the consistency of said input values.

3,273,126
COMPUTER CONTROL SYSTEM
Charles Edward Owen, Chandlers Ford, Antony Peacock, St. Giles Hill, Winchester, and Daniel M. Taub, Winchester, England, assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 25, 1961, Ser. No. 133,867
6 Claims. (Cl. 340—172.5)



1. A circuit for controlling micro-program steps in a computer comprising in combination a plurality of magnetic cores having at least one stable flux condition, said cores being arranged in rows and columns, all said cores being initially set to said stable condition; a plurality of first separately energizable drive means, one for each of said rows, and a plurality of second separately energizable drive means, one for each of said columns, a core being driven out of said stable condition only in response to the energization of both the row drive means and the columns drive means corresponding to it, at least one of said plurality of drive means being divided into sets, there being, for each drive means of a set, a drive means corre-

sponding to it in each other set of the same plurality of drive means; output means responsive to a core being driven out of its stable condition for generating a set of output signals to the computer; set selecting means responsive to a core being driven out of its stable condition for

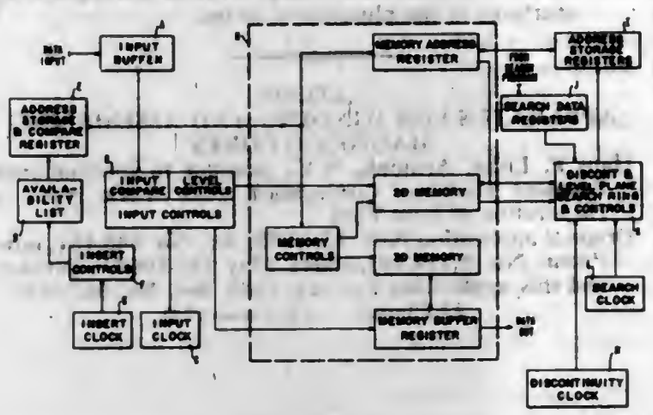


determining the sets in which the next drive means to be selected will be located; and address selecting means responsive to a core being driven out of its stable condition for determining which particular drive means in the selected sets will be energized next.

3,273,127
DIGITAL SORTING SYSTEM
Philip N. Armstrong, 17331 Keegan Way, Santa Ana, Calif.
Filed Sept. 4, 1962, Ser. No. 221,143
3 Claims. (Cl. 340—172.5)

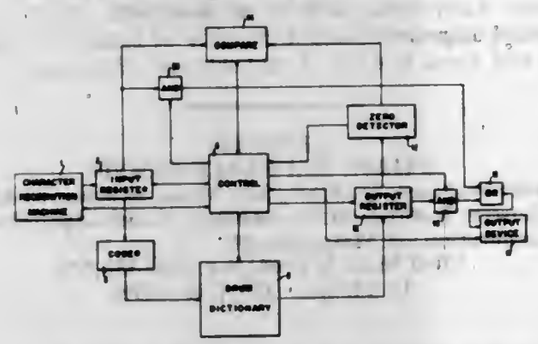
1. A digital compare-sorting network for comparing an unknown multi-bit binary input signal with a plurality of sequenced multi-bit binary input signals, and for shifting the unknown binary input signal into a sorted position in the sequence, said network including: a plurality of input terminals for receiving the sequenced input signals in parallel and on a bit-by-bit serial basis; a further input terminal for receiving the unknown input signal on a bit-by-bit serial basis; a plurality of output terminals across which all said input signals appear in a sorted sequence; a plurality of gate circuits coupling said further input terminal and predetermined selections of said plurality of input terminals to respective ones of said output terminals; a plurality of exchange flip-flops and a plurality of inhibit flip-flops each having output terminals connected selectively to said gate circuits to control the passage of signals therethrough between said input and output terminals; a first plurality of compare circuits all coupled to said further input terminal and respectively coupled to said input terminals of said plurality for setting a selected one of said exchange flip-flops whenever an inequality occurs between a unity bit of said unknown input signal and a corresponding bit of any of said sequenced input signals; a second plurality of compare circuits all coupled to said further input terminal and respectively coupled to said input terminals of said plurality for setting a selected one of said inhibit flip-flops whenever an inequality occurs between a zero bit of said unknown input signal and a corresponding bit of any of said sequenced input signals, said gate circuits being thereby controlled by said exchange flip-flops effectively to shift said unknown input signal from one output terminal to the next whenever one of said exchange flip-flops is set, and to inhibit any further shift thereof when one of said inhibit flip-flops is set.

3,273,128
FREQUENCY MULTIPLEXING CIRCUIT
Leonard B. Ruthazer, Norwood, Mass., assignor to Honeywell Inc., a corporation of Delaware
Filed Dec. 31, 1962, Ser. No. 248,673
12 Claims. (Cl. 340—172.5)



1. Data transfer apparatus comprising a plurality of data channels, a delay line, means for providing a clock frequency signal, means in each channel for mixing said clock frequency signal with a high-frequency signal unique to said channel to amplitude-modulate the latter signal, means in each channel for gating a separate data signal with the output of said mixing means in synchronism with said clock frequency, means for simultaneously coupling the output of each of said gating means to said delay line, means in each channel coupled to said delay line for recovering an output signal corresponding to the data signal in said channel, and means for coupling each of said output signals to a utilization device.

3,273,129
COMPUTER DATA STORAGE AND HANDLING SYSTEM HAVING MEANS FOR LINKING DISCONTINUOUS DATA
Alvin P. Mullery, Chappaqua, and Ralph F. Schauer, Hawthorne, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 5, 1963, Ser. No. 292,862
41 Claims. (Cl. 340—172.5)



1. A data handling system for inputing data into the main memory of an electronic computer in discontinuous storage locations in said memory including means for

creating and storing a linking address in the data in the machine word stored in the last machine word location of a first discontinuous storage location, said linking address containing the address of the first machine word of

a second discontinuous storage location where the remainder of the data is stored, and means for storing said linking address at a predetermined location in said machine word.

3,273,130
APPLIED SEQUENCE IDENTIFICATION DEVICE
Herbert B. Baskin, Mohegan Lake, and Raymond E. Bonner, Yorktown Heights, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 4, 1963, Ser. No. 327,916
25 Claims. (Cl. 340—172.5)

1. An apparatus for identifying an applied sequence of symbols having a redundant notation comprising, in combination:

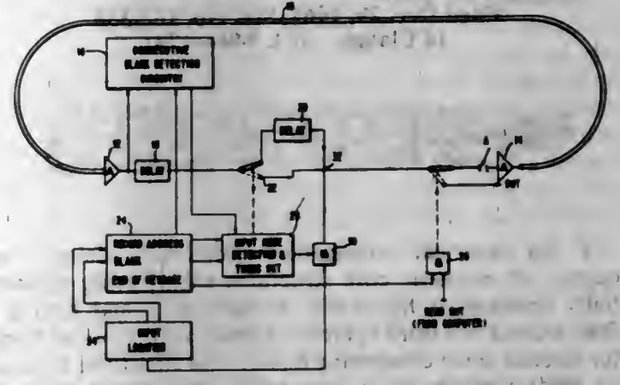
means for converting the applied sequence into a second sequence where the second sequence is described by a notation that is less redundant than the notation which describes the applied sequence;

means for providing a plurality of reference sequences,

means for comparing the second sequence with said reference sequences to provide an indication of at least one corresponding sequence in the first notation which corresponds to the second sequence;

and means for selecting one of said at least one corresponding sequence, by comparing at least one of said at least one corresponding sequence with the applied sequence.

3,273,131
QUEUE REDUCING MEMORY
William G. Strohm, Yorktown Heights, and Ernesto F. Yhap, New York, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 31, 1963, Ser. No. 334,761
16 Claims. (Cl. 340—172.5)



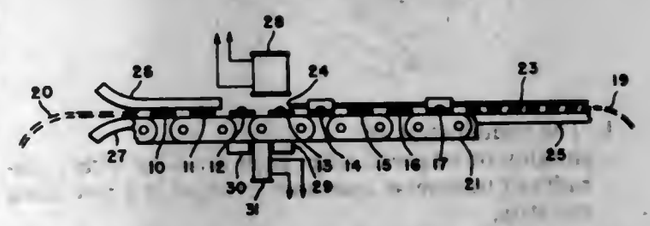
1. An information storage system wherein multiple character messages may be stored in unallocated storage positions and be of variable field length wherein each message begins with a specific "record address" character which identifies a particular message and wherein only one such "record address" character is associated with any one message, said system comprising:

(a) a high-speed serial main memory comprising a recirculating storage loop;

(b) means for continuously recirculating the contents of said loop and for erasing same at any desired time;

(c) input register means selectively connectable to said loop for inputing new data thereto;

(d) means for continuously scanning said loop for a minimum number of available storage locations to ascertain at which point new data is to be inserted;



(e) means for entering the new data at said point regardless of information stored in the loop subsequent thereto;

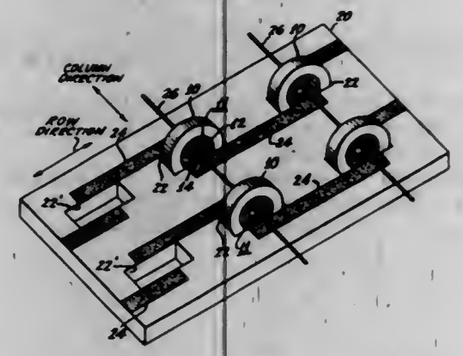
(f) means for inserting a delay in said loop for delaying previously stored data in said loop subsequent to said input point if insufficient "blank" storage locations are available to store a segment of new data without interfering with said previously stored data;

(g) means to scan said loop for a sufficient storage availability condition of said loop subsequent to the entry point of said new data, and

(h) means actuable in response to said last said means to remove said delay from said loop.

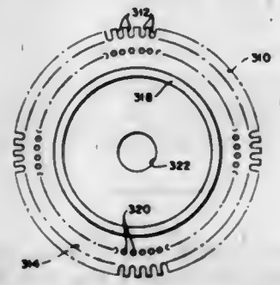
3,273,132
MECHANICAL SPRING FINGER DATA STORAGE SYSTEM
Joseph W. Davis, Chester Heights, Pa., assignor to General Atronics Corporation, Wyndmoor, Pa., a corporation of Pennsylvania
Continuation of application Ser. No. 132,880, Aug. 21, 1961. This application Dec. 9, 1964, Ser. No. 418,947
2 Claims. (Cl. 340—173)

1. In a data storage system including a barrier, a plurality of deflectable spring fingers moving in their undeflected positions along said barrier adjacent one side thereof, and electro-magnetic means energizable to deflect selected ones of said spring fingers at the beginning of their movement along said barrier so as to cause them to move adjacent the opposite side of said barrier, the improvement comprising auxiliary magnetic means opposing said deflection produced by said electro-magnetic means, said auxiliary magnetic means having insufficient strength to counteract the deflection produced by said electro-mag-



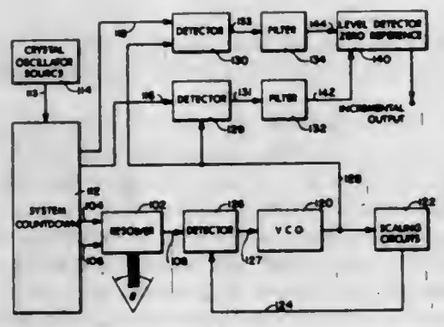
netic means and comprising a first magnet positioned so that any one of said moving spring fingers becomes subject to the substantial influence of said magnet after it has become subject to the influence of said electro-magnet, and a second magnet so positioned that any one of said moving spring fingers traverses the region in which it is subject to the influence of said second magnet before becoming subject to the substantial influence of said electro-magnet.

3,273,133
MAGNETIC CONTROL CIRCUIT
Neal D. Newby, Leonia, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 29, 1961, Ser. No. 163,338
16 Claims. (Cl. 340—174)



1. An electrical propagation circuit comprising a sequence of magnetic core structures each having substantially rectangular hysteresis characteristics and having a first, second and third aperture therein, a plurality of transfer circuits, each connecting one of said structures through its third aperture to a succeeding structure through its first and second apertures, a single priming circuit serially linking identically each adjacent structure of said sequence through its third aperture, and a single advance circuit serially linking identically each adjacent structure of said sequence through its third aperture.

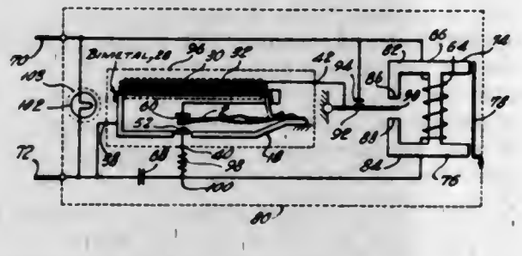
3,273,134
PRINTED CIRCUIT ASSEMBLIES OF MAGNETIC CORES
Henry P. Lemaire, Natick, and Lloyd B. Smith, Scituate, Mass., assignors to Radio Corporation of America, a corporation of Delaware
Filed Sept. 28, 1962, Ser. No. 226,812
2 Claims. (Cl. 340—174)



1. The combination of
a plurality of magnetic strips each provided with a plurality of transverse apertures arranged in a row along the strip,
a first printed conductor on each strip extending along one side to an aperture, on the wall of the aperture to the other side, along the other side to the next aperture, and so on,
an insulating layer over said printed conductor on both sides of each strip and on the walls of the apertures,
a plurality of second printed conductors each extending through one insulated aperture and covering areas on the sides of the insulated strip adjacent the aperture,
a sheet of insulating material provided with grooves dimensioned to receive and hold said strips, and
printed conductors on said sheet extending transversely between said grooves and connected to said second printed conductors on said strip to form continuous conductive paths extending through corresponding apertures in the plurality of strips.

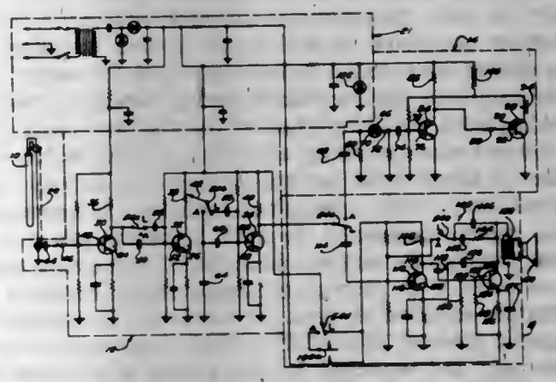
3,273,135
APPARATUS FOR WINDING AND ASSEMBLING MAGNETIC CORES
Hans P. Luhn, Armonk, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Original application Nov. 21, 1955, Ser. No. 548,131, now Patent No. 3,134,163, dated May 26, 1964. Divided and this application Feb. 25, 1964, Ser. No. 363,658
22 Claims. (Cl. 340—174)

9. A magnetic core memory matrix construction comprising a plurality of core mounting means, a plurality of magnetic cores mounted in each of said mounting means, each of said mounting means being movable relative to each other such as to determine said cores in selected alignments, and a plurality of conductors threading said cores in each of said selected alignments.



3,273,136
PHASE REPEATER SERVO
Robert W. Steer, Jr., Haverhill, Mass., assignor to Massachusetts Institute of Technology, Cambridge, Mass., a corporation of Massachusetts
Filed Mar. 9, 1964, Ser. No. 350,226
11 Claims. (Cl. 340—198)

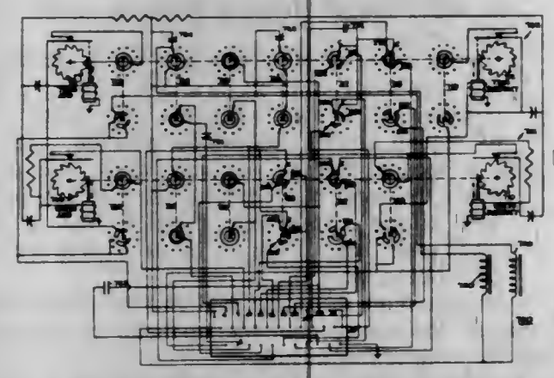
1. In combination
(a) an electromechanical resolver adapted to produce an electrical output S108 in a pick-up coil at a first frequency when excited with a first reference signal S104 at said frequency having a first phase, designated the reference phase, and a second reference signal S106 having a second phase substantially displaced from said reference phase, said output S108 having a phase which varies from said reference phase as the input angle θ, which angle measures the rotation of said coil relative to a reference position.
(b) a source 114 of a high frequency wave S113,
(c) countdown means 112 for producing said reference signals S104 and S106 precisely locked in phase to said high frequency wave S113,



(d) countdown means 112 for producing a third reference signal S116 precisely locked in phase to said high frequency wave, said third signal having an intermediate frequency which is an improper rational fraction of said first frequency,
(e) controlled means 120 for generating a first variable frequency signal S128 having a frequency in the neighborhood of said intermediate frequency,
(f) scaling means 122 for generating a second variable frequency signal S124, phase-locked to said first variable frequency signal S128 at the frequency obtained by dividing said first variable frequency by said improper rational fraction,
(g) means 126 for comparing said second variable signal S124 with said output signal S108 and for generating an error signal S127 which depends upon the phase difference between said second variable signal S124 and said output signal S108,
(h) said controlled means 120 responsive to said error signal S127 for changing said frequency of said first variable signal S128 in the direction to minimize the phase difference between said second variable signal S124 and said output signal S108,
(i) means 129 for comparing said first variable frequency signal S128 with said third reference signal S116 and for generating a signal S131, comprising a difference signal S142 and higher frequency modulation products, where said signal S142 depends upon the phase difference between said first variable signal S128 and said third reference signal S116,
(j) means 132 for separating said difference signal S142 from said higher frequency modulation products, and
(k) means 140 for generating an incremental output signal when said difference signal S142 crosses a predetermined level.

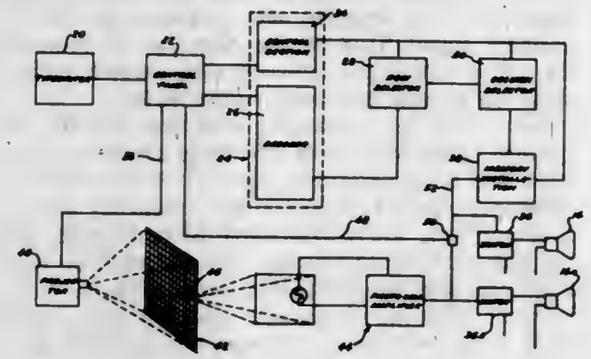
3,273,137
TIME DELAY SNAP SWITCH
George G. Merkl, New Milford, N.J., assignor to Tung-Sol Electric Inc., a corporation of Delaware
Filed Sept 24, 1963, Ser. No. 311,133
1 Claim. (Cl. 340—310)

A receiver responsive to signals sent over power transmission lines when the normal line voltage and at a higher frequency than the normal line voltage which comprises:
(a) a connection means for electrically coupling said receiver to said power transmission lines;
(b) a capacitor;
(c) an electro magnet whose coil is connected in series with the capacitor and said connection means to permit current to flow through said coil when said receiver is coupled to said power transmission lines;
(d) two normally open contacts;
(e) a paramagnetic armature carrying one of said normally open contacts, said paramagnetic armature being positioned and designed to close said two contacts when the magnetic field of said electro magnet exceedes a certain threshold level, said threshold level being greater than the magnitude of the magnetic field set up by the normal level of line voltage being transmitted through said power transmission lines and less than the magnetic field set up by both the normal level of line voltage and the signals of higher frequency than the line voltage being transmitted over the power transmission lines;
(f) an indirectly heated snap switch having:
(i) a snap plate;
(ii) an electric heater;
(iii) a pull ribbon positioned adjacent the heater and coupled to the snap plate to hold the snap plate compressed so that said snap plate switches from a first circuit controlling position to a second circuit controlling position in response to the heating of said pull ribbon by said heater, said pull ribbon having on one side thereof a first metal with a small coefficient of expansion at lower temperatures and a higher coefficient of expansion at higher temperatures and having on the other side thereof a second metal with a coefficient of expansion at lower temperatures which is greater than the coefficient of expansion of the first metal at lower temperatures;
(iv) a first pair of contacts which are closed while the snap plate is in its first circuit controlling position and opened when the snap plate is in its second circuit controlling position; and
(v) a second pair of contacts which are open when the snap plate of said snap switch in its first circuit controlling position and closed when said snap plate is in its second circuit controlling position;
(g) a series circuit including said two normally open contacts, the heater coil, the first pair of contacts, and the connection means;
(h) a second series circuit including the coil of the electro magnet the second pair of contacts and the connection means; and
(i) a paramagnetic buzzer armature responsive to the magnetic field of the electro magnet when the second pair of contacts is closed.



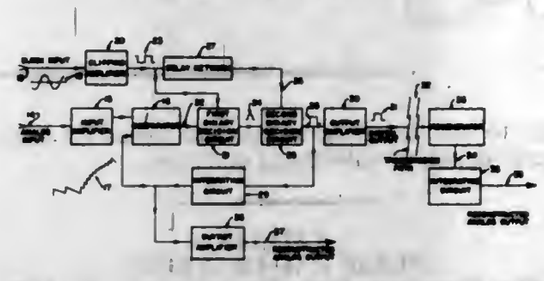
3,273,138
SWIMMING POOL MONITOR
Eric A. Kolm, Brookline, Mass., assignor to Sonus Corporation, Cambridge, Mass.
Filed Apr. 28, 1964, Ser. No. 363,206
7 Claims. (Cl. 340—261)

2. A swimming pool monitor comprising a first transducer for positioning in the water in said pool, said first transducer producing electric signals in response to sound vibrations in the pool, first amplifier means connected to the output of said transducer, said first amplifier means including switch means operative between two positions so as to feed the output of said first amplifier



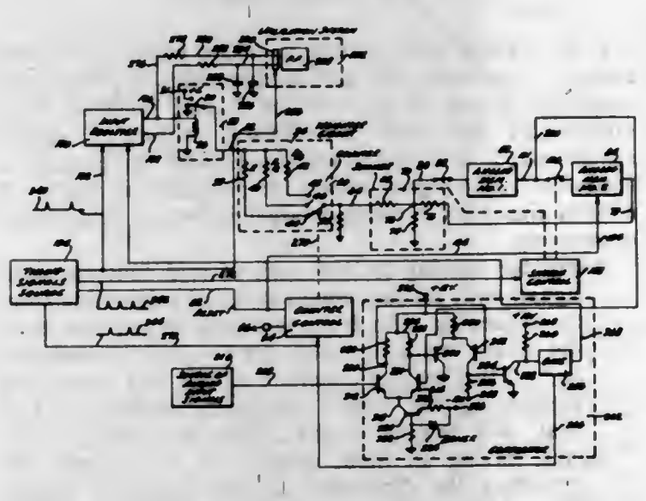
means selectively to said positions, second amplifier means connected to one position of said switch means, regenerative feedback means in said second amplifier means, said feedback means including a second switch operative coincidentally with said switch so as to disable said feedback circuit when said switch means is in its said one position and to enable said feedback circuit when said switch means is in its other said position, a second transducer connected to the output of said second amplifier means and a detector circuit connected between said other switch means position and said second amplifier means, said detector circuit causing said second amplifier means to oscillate only upon arrival of signals from said first transducer.

3,273,139
TIME AND TEMPERATURE DISPLAY SIGN
Thomas E. Flactiff and Melvin R. Holmes, Grand Island, Nebr., assignors to Chronolux Corporation, Grand Island, Nebr., a corporation of Nebraska
Filed Feb. 3, 1964, Ser. No. 341,869
9 Claims. (Cl. 340—334)



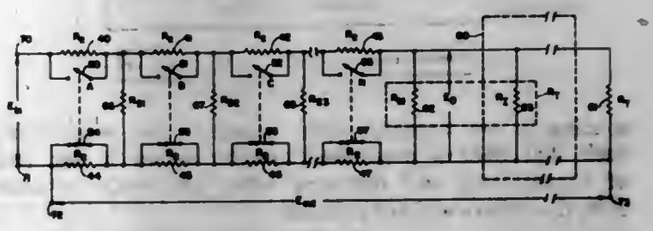
4. A time and temperature display sign comprising a display panel having a plurality of neon strips each being connected to a separate energizing transformer, said transformers being connected to a plurality of separate energizing circuits for energization in various combinations to provide a visual display of time and temperature including a plurality of uni-directional rotary stepping switches operable for selectively energizing said transformers to display a visual indication of time, a plurality of bi-directional rotary stepping switches operable for selectively energizing said transformers to display a visual indication of temperature, transfer switching means for alternately interconnecting said uni-directional rotary stepping switches and said bi-directional rotary stepping switches to said transformers, a power source, a clock mechanism connected to said power source including a motor driven cam and a switch arranged for actuation by said cam in a predetermined timing sequence, means connecting said uni-directional rotary stepping switch to said power source whereby actuation of said switch establishes a signal with respect to time for setting said uni-directional rotary stepping switches, temperature sensing means connected to said bi-directional rotary stepping switches for setting said bi-directional rotary stepping switches with respect to temperature including a temperature sensitive element for measuring temperature, a magnetic element connected to said temperature sensitive element and mounted for movement in response to changes in temperature, a pair of magnetically actuable switches movably supported adjacent said magnetic element and actuable in response to movement of said magnetic element, relay means serially connected in circuit with said switch means for energization in response to actuation of one of said pair of switches and a stepping motor arranged to be energized upon actuation of said motor driven cam to position said pair of switches such that said magnetic element is disposed between said pair of switches in a neutral position, and means connecting said transfer switching means to said power source including a change-over switch arranged to be actuated by said motor driven cam for establishing a predetermined timing sequence of interconnection of said unidirectional rotary stepping switches and said bi-directional rotary stepping switches.

3,273,140
COMBINATION MESSAGE AND IMAGE DISPLAY UNIT
Jacques Y. Foster and Le Roy J. Thompson, Des Moines, Iowa, assignors to Fair-Play Manufacturing Co., Des Moines, Iowa, a corporation of Iowa
Filed July 19, 1963, Ser. No. 296,317
1 Claim. (Cl. 340—334)



In a device of the class described,
a sign structure,
a first group of electrical display lamps mounted on said sign structure,
a second group of electrical display lamps mounted on said sign structure adjacent to said first group of electrical display lamps,
a first electrical control circuit electrically connected to each of said lamps in each group of lamps,
first means electrically connected to said first electrical circuit for selectively illuminating various of said lamps whereby said illuminated lamps will formulate only a message in the form of letters and numerals,
a second electrical control circuit electrically connected only to said second group of lamps,
second means electrically connected only to said second electrical control circuit for illuminating various of said lamps whereby said illuminated lamps will formulate an image in the form of pictures, said second means including means for projecting a light image having varying degrees of light intensity on a photo-cell grid comprised of a plurality of individual photo-cells, with each photo-cell being electrically connected only to a single lamp in said second group of lamps; said photo-cells and the corresponding lamps to which they are connected being positioned in an identical pattern,
and a control means electrically interconnecting said first and second control circuits to control and coordinate the illumination of said first and second groups of lamps, said control means including means for selectively limiting the energization of said first electrical control circuit to said first group of lamps while said second electrical control circuit is energized to form an image on said second group of lamps, whereby a message in the form of numerals and letters is formed only on various lamps in said first group of lamps, and an image is simultaneously formed only on various of said lamps in said second group of lamps.

3,273,141
HIGH SPEED ANALOG-TO-DIGITAL CONVERTER
Kenneth R. Hackett, Boulder, Colo., assignor to Ball Brothers Research Corporation, Boulder, Colo., a corporation of Colorado
Filed Mar. 19, 1963, Ser. No. 266,283
17 Claims. (Cl. 340—347)

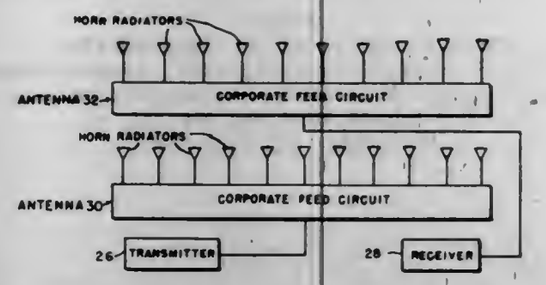


1. A high speed analog-to-digital converter comprising an analog input amplifier circuit, a comparator circuit coupled with the amplifier circuit, a plurality of binary decision circuits connected in cascade relationship with each other and coupled with the comparator circuit, an integrating circuit coupled with the decision circuits and with the comparator circuit in feedback loop relationship, and an output amplifier circuit coupled with the decision circuits for transmitting therefrom a digital output converted from an analog input fed to the input amplifier.

3,273,142
CONVERSION SYSTEMS
Arthur S. Zukin, Encino, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed Mar. 25, 1963, Ser. No. 267,663
9 Claims. (Cl. 340—347)

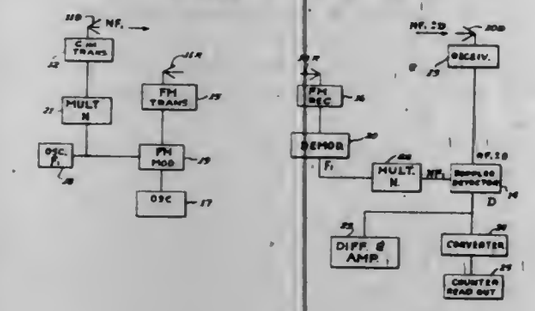
9. A digital-to-analog conversion device responsive to a sequence of binary signals of selected binary significance comprising binary input register means for sequentially storing binary bits representative of the binary signals, first analog memory means for storing a sum during a first period, second analog memory means for storing a sum during a second period, combining means for responding to said binary input register and to said second memory means for developing a sum of analog voltages sequentially equivalent to accumulated analog voltages representative of said binary pulses, first switching means for closing during a first period to apply the sum developed by said combining means to said first memory means and for opening during a second period, second switching means for closing during said second period to apply said sum stored in said first memory means to said second memory means and for opening during said first period, and means for controlling said first and second switching means to combine said sum stored in said second memory means and said analog voltage equivalent of said binary input pulse for storing the sum in said first memory means during said first period, and to store the sum in said second memory means during said second period.

3,273,143
DIGITAL-TO-ANALOG CONVERTER
Philip D. Wasserman, San Pablo, Calif., assignor to Beckman Instruments, Inc., a corporation of California
Filed Jan. 24, 1964, Ser. No. 340,865
10 Claims. (Cl. 340—347)



1. A digitally operated potentiometer for providing digitally weighted output voltages, said potentiometer including a plurality of decades each of which has a pair of input terminals and a pair of output terminals, the input terminals of the first of said decades being adapted to receive a source of reference voltage, one of said input terminals of the first of said decades and one of the output terminals of the last of said decades serving as the output terminals of the potentiometer for providing the digitally weighted output voltages, the improvement comprising
each of said decades including a first plurality of resistances of equal ohmic value connected between the first input and output terminals thereof,
each of said decades including a second plurality of resistances of equal ohmic value connected between the second input and output terminals thereof,
the resistances connected between the first input and output terminals respectively being equal to the resistances connected between the second input and output terminals of each decade,
shunting switches connected across each of said retances in each decade, with the shunting switches connected across each of the resistances between the first input and output terminals of each decade respectively operating in a complementary fashion with respect to the shunting switches connected across each of the resistances between the second input and output terminals of each decade,
a terminating resistance connected across the first and second output terminals of each of said decades, and
shunt resistances respectively connected from the junctions of certain, but not all, of the resistances of the first plurality of resistances of each decade to respective corresponding junctions between the resistances of the second plurality of resistances of each decade, said shunt resistances functioning to select the incremental output voltage weights provided by the potentiometer.

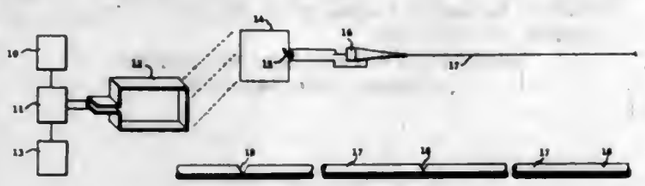
3,273,144
NARROW BEAM ANTENNA SYSTEM
William Fishbein, New Shrewsbury, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed Apr. 2, 1963, Ser. No. 270,123
3 Claims. (Cl. 343—5)



1. A radar antenna system providing improved resolution comprising, a first multiple-beam antenna for radiating R-F signal energy, said first antenna having a

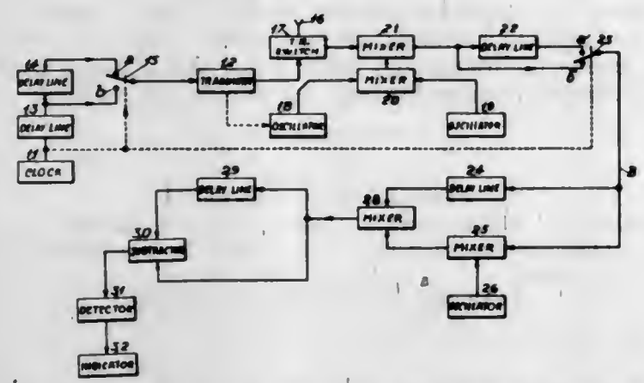
directivity characteristic of a plurality of angularly spaced lobes, a second multiple-beam antenna for intercepting reflections of the radiated R-F signal energy, said second antenna having a directivity characteristic of a plurality of angularly spaced lobes in substantially the same direction as the lobes of said first antenna, the lobe

spacing in one antenna with respect to the other being such that over a prescribed angular sector if one pair of transmitting and receiving lobes are made to coincide, the others will not coincide.



3,273,145
TRAIN SLACK MEASURING APPARATUS
Ivan L. Joy and James W. Loehring, Topeka, Kans.; Ivan L. Joy as trustee
Filed Feb. 16, 1965, Ser. No. 433,114
9 Claims. (Cl. 343—6)

1. Apparatus for measuring position variations between front and rear ends of a train, and comprising means at one end of said train for generating a fixed frequency reference signal, means at said one end for transmitting a radiated carrier signal having an FM modulation component derived from said reference signal, means at the other end of said train for receiving and demodulating said carrier signal to provide output consisting of said reference signal, means at the rear end for transmitting a radiated continuous wave signal derived from and consisting of a certain frequency multiple of the reference signal thereat, means at the front end for receiving said continuous wave signal at a Doppler shifted frequency, and means at the front end connected to respond to any frequency difference between said certain frequency multiple of the reference signal at the front end and the received Doppler shifted frequency for producing a signal representative of position variations between said front and rear ends of the train.



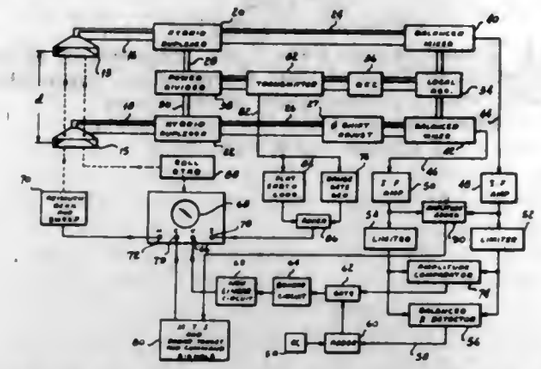
3,273,146
OBJECT IDENTIFYING APPARATUS
Henry Hurwitz, Jr., Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed Aug. 7, 1964, Ser. No. 388,243
5 Claims. (Cl. 343—6.8)

1. An object identifying apparatus comprising signal reflecting means including a piezoelectric element and an acoustic delay line having a length of sonic transmitting material with reflecting elements therein at spaced locations corresponding to predetermined coding representative of the identity of said object, said delay line being mutually coupled to said element, means for transmitting

signals to said reflecting means, and means for receiving reflected signals for identifying said object.

3,273,147
PULSE RADAR SYSTEM
Stélian Herscovici, Paris, France, assignor to CSF—Compagnie Generale de Telegraphie Sans Fil, a corporation of France
Filed Nov. 5, 1964, Ser. No. 409,175
Claims priority, application France, Nov. 8, 1963, 953,090
9 Claims. (Cl. 343—7.7)

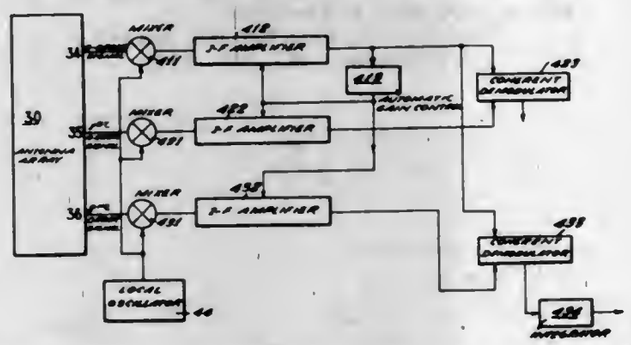
1. In a pulse radar system in which pulses of radiant energy, transmitted by said system with a birecurrent repetition period of mean value T and reflected from targets, are beat with a reference "coherent" signal, synchronized with the transmitted pulse to provide a "coherent" echo signal, means for providing an improved control signal for a moving target indicator, said means comprising:



means for causing to beat each of said coherent echo signals with the said coherent signal originating from the preceding echo from the same target, said beating means including means for frequency translating one of the beating coherent signals and means for eliminating the "sum" frequency signals of said beat, said beating means having an output;

means, having an input coupled to said output, for providing the difference of two successive signals supplied to said input;

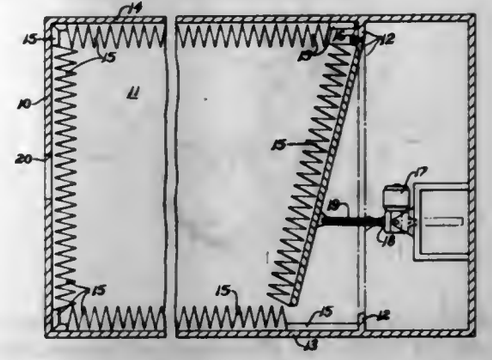
and detecting means, coupled to said last mentioned output and having an output supplying said improved control signal.



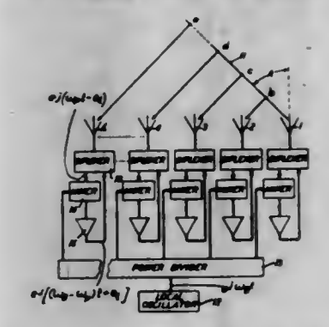
3,273,148
TERRAIN-VIEWING SYSTEM
Albert G. Wood, Pleasantville, N.Y., William W. Fenn, Old Greenwich, Conn., Thomas D. Kegelman, West Nyack, N.Y., and Howard S. Halpern, Stamford, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed Dec. 14, 1959, Ser. No. 859,489
24 Claims. (Cl. 343—11)

1. A terrain-viewing system including in combination a display tube providing a normally illuminated spot, means for transmitting signals in a downward directed pattern which is a vertical and substantially knife-like plane subtending a small azimuthal angle, a pair of reflected signal sensors disposed in a vertical plane, and means responsive to both reflected signal sensors for vertically sweeping the illuminated spot in an upward direction.

19. An information recording system including in combination a recording area, means for exciting a spot in the area, a signal source providing a variable output in accordance with the information to be recorded, and means responsive to said output for causing the excited spot to scan the area at varying instantaneous sweep rates.



3,273,149
RADAR SYSTEMS USING SECOND- AND HIGHER-ORDER RESPONSE SIGNALS
Serge V. Drabowitch, Paris, France, assignor to Compagnie Francaise Thomson-Houston, Paris, France, a corporation of France
Filed May 14, 1964, Ser. No. 367,332
Claims priority, application France, May 17, 1963, 935,219, Patent 1,366,828; Apr. 29, 1964, 972,812, Patent 85,770
23 Claims. (Cl. 343—16)

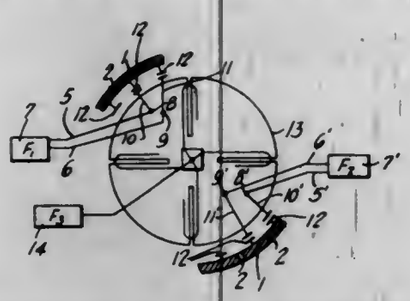


1. A radar system comprising means for irradiating a target with a radar beam, means for receiving a response beam, means for deriving from the response beam a series of at least three independent signals the variations of which as a function of angular displacement to opposite sides from target direction approximately follow a zero-order law, a first-order law and at least one law of higher order, respectively, means for exploiting said first-order-law signal to determine target direction and means for exploiting said at least one higher-order signal to derive additional information concerning the target.

3,273,150
ANECHOIC CHAMBER
William H. Emerson, Huntington, Conn., assignor to The B. F. Goodrich Company, New York, N.Y., a corporation of New York
Filed Mar. 26, 1964, Ser. No. 355,118
3 Claims. (Cl. 343—18)

1. An anechoic chamber for providing an environment simulating that of outer space in which electronic devices can be evaluated and studied, the interior wall surfaces of said chamber being lined with microwave energy absorbing material for absorbing microwave energy impinged thereagainst, said chamber comprising a back wall toward which microwave energy is directed during the evaluation and study of electronic devices in said chamber, said back wall being provided with means for varying the angle which said back wall presents to the direction from which the microwave energy is emitted in order to vary the angle at which the microwave energy absorbing material disposed on the interior surface of said back wall presents itself to microwave energy directed toward said back wall of the chamber.

3,273,151
ANTENNA SYSTEM
Cassius C. Cutler, Gillette, Rudolf Kompfner, Middletown, and Le Roy C. Tillotson, Holmdel, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 26, 1961, Ser. No. 162,165
13 Claims. (Cl. 343—100)

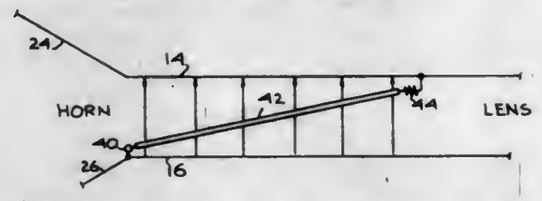


2. In a communication system, an array of antenna elements, a source of information-bearing electromagnetic waves for irradiating said array, combining means, a local oscillator, and apparatus individual to each of said antenna elements comprising means for recovering an information component and an unmodulated sine wave signal to serve as a pilot component from the portion of said wave impinging upon said antenna element, first means for mixing said pilot component with the output of said oscillator, second means for mixing said information component with the difference frequency modulation sideband produced by said first mixing means, and means for applying the sum frequency modulation sideband produced by said second mixing means to said combining means.

3,273,152
DOPPLER VOR BEACON
Charles William Earp, London, England, assignor to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware
Filed May 16, 1963, Ser. No. 280,834
Claims priority, application Great Britain, May 30, 1962, 20,747/62
6 Claims. (Cl. 343—108)

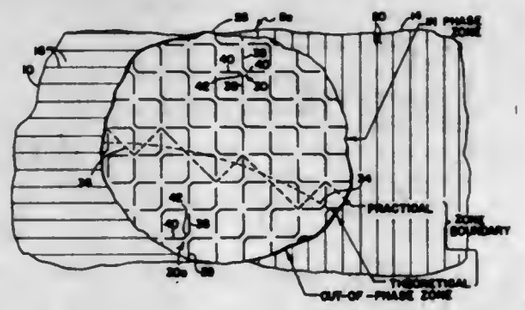
1. Radio beacon equipment including, a hollow metal circular cylinder having in its curved surface a row of

parallel slots constituting a circular array of slot antennas, means to feed the slot antennas cyclically and consecutively around the circle with a first wave train, means to feed the antennas in a similar order with a second wave

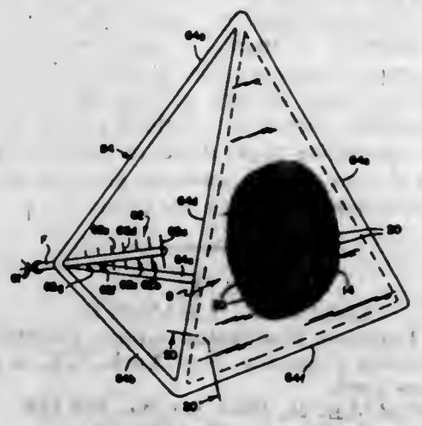


train, the two feeding cycles being always diametrically opposite on the circle and progressing at a constant rate, and means to radiate via one or more slot antennas a third wave train midway in frequency between the first and second wave trains.

3,273,153
PORTABLE FIELD ANTENNA, USABLE ABOVE DENSE FOLIAGE
Phineas J. Icenbice, Jr., Los Angeles (Northridge), Calif., assignor to Litton Systems, Inc., Woodland Hills, California
Filed Sept. 16, 1963, Ser. No. 309,017
11 Claims. (Cl. 343—706)



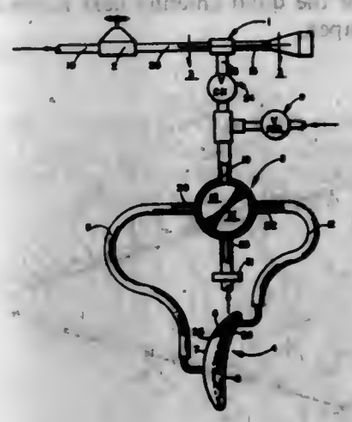
1. Apparatus for raising a portable field antenna above heavily wooded areas, said apparatus comprising:
first means for launching a projectile-like body to a predetermined altitude;
a projectile having a container therein and being engageable with said first means for being launched thereby;
an antenna housed within said container;
second means housed within said container for extending said antenna from said container;
third means connected to said antenna for supporting said antenna when extended;
a length of transmission line connected to said antenna, said length of transmission line defining said predetermined altitude;
fourth means for dispensing said transmission lines;
a plurality of spring-biased arms mounted to the side of said projectile, and radially extendable therefrom; and
means for holding said arms close to said projectile as said projectile is launched and for pivoting said arms to extend outward from said projectile when said arms contact foliage of the wooded area, said arms being operative to support said container on said foliage and to provide a ground plane for said antenna.



3,273,154
LENS FEED SYSTEM
Robert L. Tanner, Menlo Park, Calif., assignor, by mesne assignments, to Control Data Corporation, South Minneapolis, Minn., a corporation of Minnesota
Filed May 27, 1964, Ser. No. 370,471
9 Claims. (Cl. 343—753)

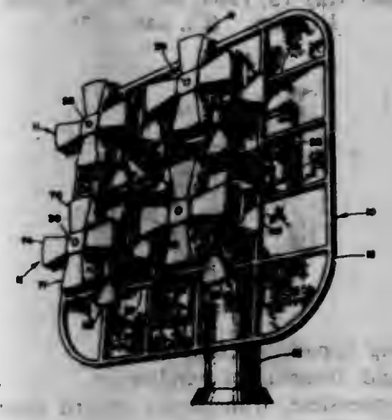
1. In a wire grid lens antenna of the type wherein said wire grid lens comprises an upper and a lower lens element each being made of wire grid and each having substantially the shape of a disc, both resembling two spaced nesting shallow saucers, said upper and lower elements being spaced a predetermined distance from one another, an improved feeding structure comprising conductor means extending from an edge of one of said two spaced lens elements radially inwardly to the surface of the other of said two lens elements, means for applying excitation between said edge and said conductor means, and means for coupling said conductor means to the surface of said lens element to which it extends.

3,273,155
FRESNEL ZONE LENS ANTENNA
Herbert P. Raabe, St. Paul, Minn., assignor, by mesne assignments, to Litton Systems, Inc., Beverly Hills, Calif., a corporation of Maryland
Filed Sept. 13, 1963, Ser. No. 308,861
13 Claims. (Cl. 343—753)



1. A Fresnel zone lens antenna comprising:
first polarizing means residing in a first plane;
second polarizing means residing in a second plane parallel to said first plane and spaced a predetermined distance therefrom, the plane of polarization of said second polarizing means being oriented at an angle of 90 degrees relative to that of said first means;
said first and second polarizing means include polarizing grids oriented at an angle of 90 degrees with respect to each other;
third means residing in a third parallel plane between said first and second planes for rotating the polarization plane of an incident wave through 90 degrees as the wave energy passes from said first polarizing means to said second polarizing means, said third means including a polarizing grid oriented at an angle of 45 degrees with respect to the grid of said first means and at an angle of 45 degrees with respect to the grid of said second means;
said third means further including zones of alternate rotation of polarization composed of said polarizing grids, the grids in one zone being inclined at an angle of 45 degrees in one direction and the grids in the next adjacent zone being inclined at an angle of 45 degrees in the opposite direction.

3,273,156
RADIO TELESCOPE HAVING A SCANNING FEED SUPPORTED BY A CABLE SUSPENSION OVER A STATIONARY REFLECTOR
Helias Doundoulakis, Brooklyn, N.Y., assignor, by direct and mesne assignments, of twenty-five percent to Constantine A. Michaloz, Fort Lee, N.J., and twenty-five percent to William J. Casey, Long Island, N.Y.
Filed Sept. 11, 1961, Ser. No. 137,202
8 Claims. (Cl. 343—765)

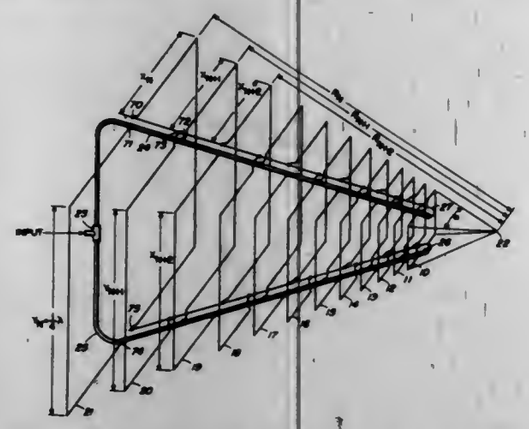


1. An antenna comprising, in combination, a concave reflector affixed to the surface of the earth, and a radio beam feeding and scanning mechanism including a network of cables, a skeleton frame, said frame being supported by said network at an accurately determinable position above said reflector, a circular track mounted and aligned generally horizontally upon said frame, an arm mounted upon and being revolvable on said circular track, and a beam radiating element mounted upon said arm, said beam radiating element being movable along said arm, the rotation of said arm on said circular track and the movement of said radiating element along said arm providing feeding and scanning motion for said radiating element.

3,273,157
PNEUMATIC CONTROL SYSTEM FOR RADAR ANTENNA
Thomas C. Kirstein, Anaheim, Calif., assignor to North American Aviation, Inc.
Filed Feb. 21, 1964, Ser. No. 346,569
2 Claims. (Cl. 343—781)

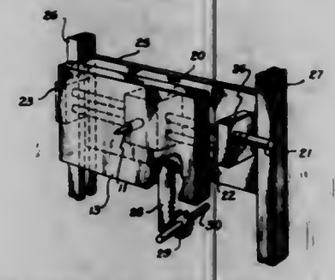
1. An antenna comprising:
first and second bulkheads defining a chamber case;
a deformable reflective diaphragm mounted in said case between said bulkheads to define a first and second chamber;
evacuating pneumatic control means for evacuating one of said chambers and venting the other to the atmosphere whereby said diaphragm is selectively urged against a selected one of said bulkheads.

3,273,158
MULTI-POLARIZED TRACKING ANTENNA
Thomas R. Fouts, Fort Worth, and Edwin G. Keiffer and Charles T. Wadlington, Dallas, Tex., assignors, by mesne assignments, to Ling-Temco-Vought, Inc., Dallas, Tex., a corporation of Delaware
Filed July 19, 1961, Ser. No. 125,122
10 Claims. (Cl. 343—792)



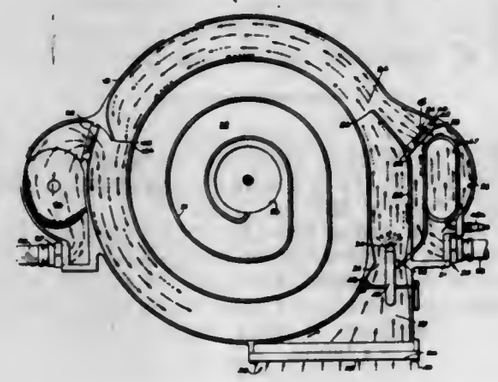
6. In an antenna arrangement, the combination of a first pair of half-wavelength dipoles and a second pair of half-wavelength dipoles mounted in a cruciform arrangement, at least one set of directors including in each set first and second pairs of retarding elements disposed in spaced-apart and generally aligned relation to said first and second pairs of dipoles, the retarding elements of each pair being electrically isolated from each other and also from the retarding elements of the other pairs.

3,273,159
LOG PERIODIC ANTENNA COMPRISED OF PARALLEL FED QUAD ELEMENTS
Jesse Carol Holloway, Richardson, Tex., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Filed June 23, 1964, Ser. No. 377,283
12 Claims. (Cl. 343—792.5)



1. Logarithmically periodic antenna means comprising a plurality of at least four quad antenna elements constructed to form a frustum with each quad lying in a plane substantially perpendicular to the axis of said frustum,

the radial distance of the plane of any quad antenna element measured from the apex of the frustum, bearing a constant ratio τ to the radial distance of the plane of the quad antenna next farthest removed from said apex,



said apex being defined as the point of convergence of the frustum when extended,
and feed means for supplying an input signal to each of said quad antenna elements in a parallel manner.

INDENTING RECORDER WITH ILLUMINATION MEANS
Gustave Shapiro, Silver Spring, and Robert O. Stone, Kensington, Md., assignors to the United States of America as represented by the Secretary of Commerce
Filed May 15, 1964, Ser. No. 367,908
1 Claim. (Cl. 346—77)

A recording apparatus comprising:
a hard, rigid, translucent window,
a thin, impressible, transparent record sheet,
means for positioning a selected portion of said record sheet firmly against the rear surface of said window,
an indenting pin,
means for positioning said indenting pin adjacent the exposed surface of said record sheet at a selected point within the area of said window,
means for selectively pressing the point of said indenting pin into said record sheet to form a small dent in said sheet at said selected point, said record sheet being supported by said window, and
a light panel disposed about said indenting pin and parallel to said window, said light panel having a length and width substantially at least twice the length and width, respectively, of said window, said indenting pin extending centrally of said light panel, whereby all points of said portion of said record sheet disposed against said window are illuminated with light rays normal thereto at any selected position of said indenting pin, causing the dents in said record sheet to appear as distinct dark dots in a bright field, and whereby said indenting pin in the non-operated position adjacent said record sheet is not visible through said translucent window.

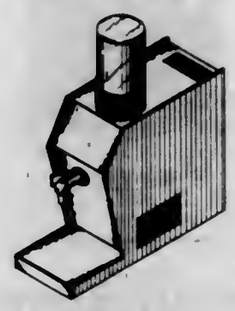
FUEL ECONOMIZER AND EXHAUST GAS PURIFIER DEVICE
Rocco F. Di Giorgio, Miami, Fla., assignor to Keller Industries, Inc., Miami, Fla.
Filed Mar. 3, 1966, Ser. No. 531,533
16 Claims. (Cl. 123—119)

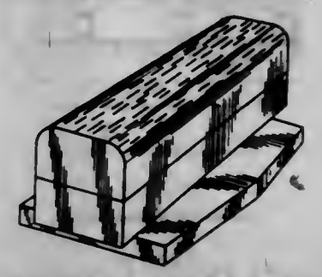


10. In a fuel economizer and exhaust gas purifier device for an internal combustion engine having a carburetor and exhaust pipe, a generally cylindrical base having a central outlet opening for connection with the air intake of the carburetor, a generally cylindrical wall integral with and upstanding from the periphery of said base, and a cover removably secured to and over the rim of said wall to form a housing with said base and wall, first and second circumferentially-spaced inlets through said wall, said first inlet including a venturi throat through which ambient air passes into said housing, a connection to said second inlet to supply exhaust gas to said housing from the exhaust pipe of the engine, fuel injector means mounted in said venturi throat for supplying fuel to air entering through said first inlet, conduit means connected with said injector for supplying fuel thereto, said fuel-air mixture being blended with exhaust gas entering through said second inlet, in said housing, prior to passage of the blended mixture to said central outlet opening; and
a third inlet in said wall for connection with the engine exhaust manifold to supply heated gas, said conduit means for supplying fuel to said injector, including a portion in said housing in heat exchange relation with gas entering said third inlet, said heated gas and fuel-air mixture being blended in said housing prior to admixture with exhaust gas entering said second inlet.

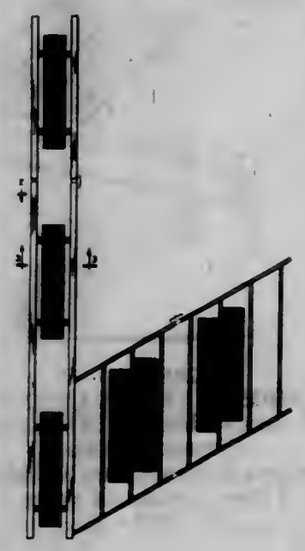
DESIGNS

SEPTEMBER 13, 1966

205,702
COOLER AND DISPENSER UNIT FOR USE IN MAKING COLD BEVERAGES, DRINKS, SOUPS AND THE LIKE
William C. Christine, Catasauqua, and Joseph E. Pierce, Allentown, Pa., assignors to Allen Electronics, Inc., Allentown, Pa., a corporation of Pennsylvania
Substituted for abandoned design application Ser. No. 81,392, Aug. 21, 1964. This application Oct. 22, 1965, Ser. No. 358
Term of patent 14 years
(Cl. D2—3)

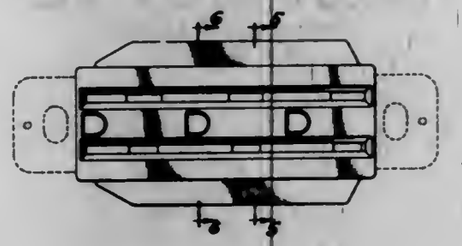


205,703
SHIRT
Bernard S. Kulesa, 29 Alfred St., Rochester, N.Y.
Filed Aug. 25, 1965, Ser. No. 86,707
Term of patent 14 years
(Cl. D3—25)

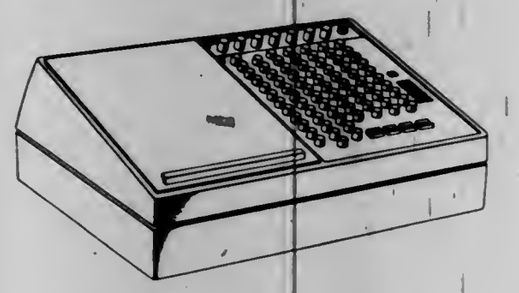


205,704
COWBOY BOOT
Harry Vise, Nashville, Tenn., assignor to Texas Boot Manufacturing Company, Inc., Lebanon, Tenn., a corporation of Tennessee
Filed Mar. 10, 1966, Ser. No. 1,392
Term of patent 14 years
(Cl. D7—7)

205,705
CLAW CONDITIONER FOR ANIMALS
Robert C. Greider, E. 734 38th Ave., Spokane, Wash.
Filed Sept. 13, 1965, Ser. No. 86,966
Term of patent 14 years
(Cl. D12—2)

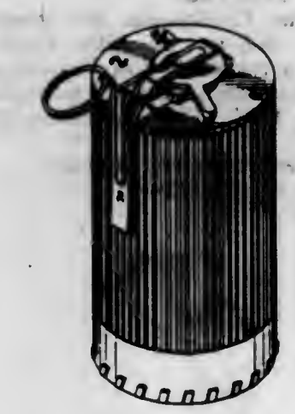


205,706
COMBINED RAILING AND END COLUMN
Sherman Shore, Pittsburgh, Pa., assignor to Napco, Inc., Pittsburgh, Pa., a corporation of Pennsylvania
Filed Feb. 23, 1965, Ser. No. 83,927
Term of patent 14 years
(Cl. D13—7)



205,707
UPHOLSTERED CHAIR
Theodore A. Cowen, Jr., Belvidere, Ill., assignor to Belvedere Products Inc., Belvidere, Ill., a corporation of Illinois
Filed Jan. 15, 1965, Ser. No. 83,460
Term of patent 14 years
(Cl. D15—1)

205,708
ELECTRICAL RECEPTACLE FACE PLATE
Lee T. Bordner, Los Angeles, Calif., assignor to Sierra Electric Corporation, Gardena, Calif., a corporation of California
Filed June 1, 1965, Ser. No. 85,538
Term of patent 14 years
(Cl. D26—1)

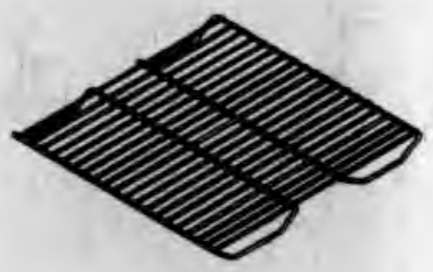


205,709
MANUAL DATA ENTRY KEYBOARD CONSOLE
Rae F. Tankard, Owego, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Feb. 6, 1964, Ser. No. 78,543
Term of patent 14 years
(Cl. D26—5)

205,710
CHRISTMAS ORNAMENT
James F. Kirchenbauer, 1187 E. 169th St., Cleveland, Ohio
Filed June 21, 1965, Ser. No. 85,826
Term of patent 14 years
(Cl. D29—1)

205,711
GRENADE FOR DISPENSING GASES, LIQUIDS, OR THE LIKE
Robert W. Schnepfe, Jr., 111 Cinder Road, Timonium, Md.; Francis J. Pilarski, 4618 Raspe Ave., Raspeburg, Md.; Irwin R. Barr, 110 Martingale Road, Lutherville, Md.; and David Sylvester, P.O. Box 32, Phoenix, Md.
Filed Sept. 8, 1965, Ser. No. 86,901
Term of patent 14 years
(Cl. D30—1)

205,712
GRENADE CANISTER
David Sylvester, Rte. 1, Phoenix, Md.; Irwin R. Barr, 110 Martingale Road, Lutherville, Md.; Robert W. Schnepfe, Jr., 111 Cinder Road, Timonium, Md.; and Francis J. Pilarski, 4618 Raspe Road, Raspeburg, Md.
Filed Sept. 8, 1965, Ser. No. 86,903
Term of patent 14 years
(Cl. D30—1)



205,713
TOY ANIMAL FIGURE OR SIMILAR ARTICLE
Edmund C. Wilson, New York, N.Y., assignor to Wingfield-Wilson, New York, N.Y., a firm
Filed Oct. 23, 1965, Ser. No. 87,831
Term of patent 7 years
(Cl. D34—2)

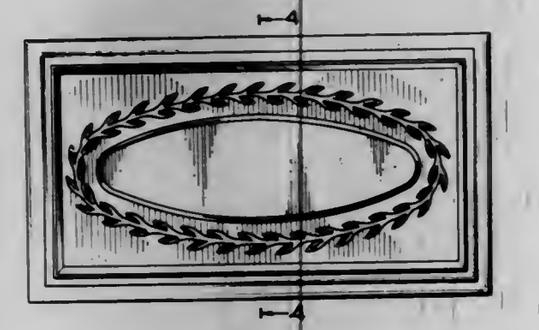
205,714
PULL TOY
Milton A. Traka, North Aurora, Ill. (403 W. Galena, Aurora, Ill.)
Filed Oct. 5, 1965, Ser. No. 87,324
Term of patent 14 years
(Cl. D34—15)

205,715
BAKER'S COOLING RACK
Kurt Christoffersen, Norwich, Conn., assignor to The Artistic Wire Products Co. of Conn., Incorporated, Taftville, Conn., a corporation of Connecticut
Original design application Jan. 22, 1964, Ser. No. 78,318, now Design Patent No. 201,903, dated Aug. 10, 1965. Divided and this application Apr. 27, 1965, Ser. No. 84,976
Term of patent 14 years
(Cl. D44—29)

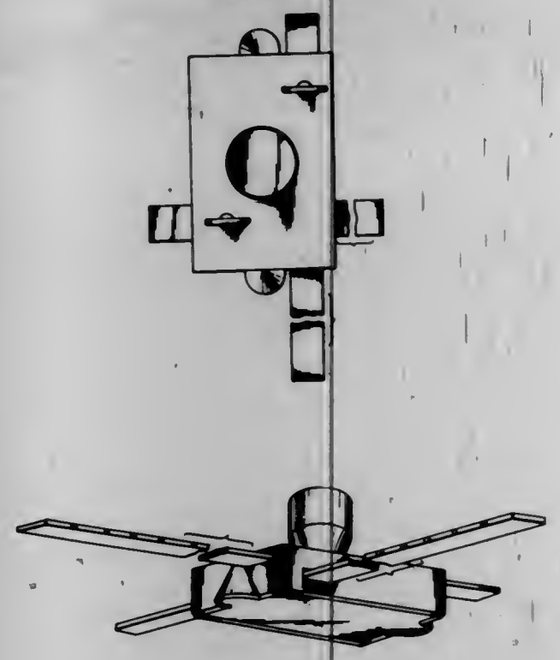
205,716
BAKER'S COOLING RACK
Kurt Christoffersen, Norwich, Conn., assignor to The Artistic Wire Products Co. of Conn., Incorporated, Taftville, Conn., a corporation of Connecticut
Original design application Jan. 22, 1964, Ser. No. 78,318, now Design Patent No. 201,903, dated Aug. 10, 1965. Divided and this application Apr. 29, 1965, Ser. No. 85,024
Term of patent 14 years
(Cl. D44—29)

205,717
END LINK FOR A WATCH BRACELET OR SIMILAR ARTICLE
Murray L. Cowan, Norwood, Mass., assignor to Textron Inc., Providence, R.I., a corporation of Rhode Island
Filed June 28, 1965, Ser. No. 85,923
Term of patent 7 years
(Cl. D45—4)

205,718
STOCKING
Paul R. Nestler, Sr., Walnut St., Green Lane, Pa.
Filed Mar. 17, 1966, Ser. No. 1,514
Term of patent 14 years
(Cl. D47—7)

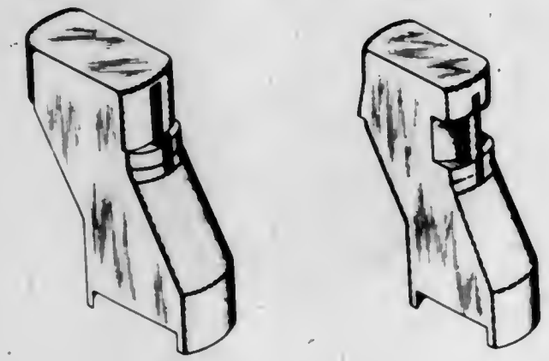


205,719
STREET LIGHTING FIXTURE
Myron F. Pettengill, Hendersonville, N.C., assignor to General Electric Company, a corporation of New York
Filed Aug. 19, 1965, Ser. No. 86,775
Term of patent 14 years
(Cl. D48—31)



205,720
STREET LAMP
Luis F. Villa, 1727 Moravian St., Philadelphia, Pa.
Filed Sept. 21, 1965, Ser. No. 87,095
Term of patent 14 years
(Cl. D48—31)

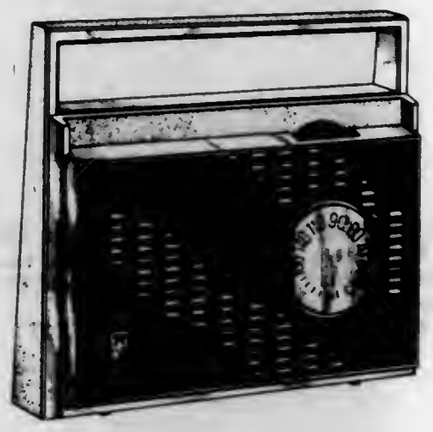
205,721
TISSUE BOX
Robert A. O'Neil, Pittsburgh, Pa., assignor to Fesco, Inc., New York, N.Y., a corporation of Delaware
Filed July 8, 1965, Ser. No. 86,076
Term of patent 14 years
(Cl. D52—2)



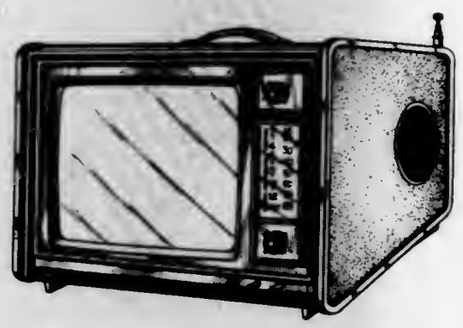
205,722
COMBINATION LOCATING-AND-MARKING GAUGE FOR JUNCTION BOXES
Herschel L. Sunley, 1814 S. 8th St., Springfield, Ill.
Filed Oct. 7, 1965, Ser. No. 87,363
Term of patent 14 years
(Cl. D52—6)

205,723
MOLDED GUITAR CARRYING CASE SHELL
Howard S. Cohen, Highland Park, Ill., and Gordon Palais, New Buffalo, Mich., assignors of one-half to Cincinnati Industries, Inc., Cincinnati, Ohio, a corporation of Ohio, and one-half to Titan Molders Corporation, Grayslake, Ill., a corporation of Illinois
Filed May 7, 1965, Ser. No. 85,178
Term of patent 14 years
(Cl. D56—1)

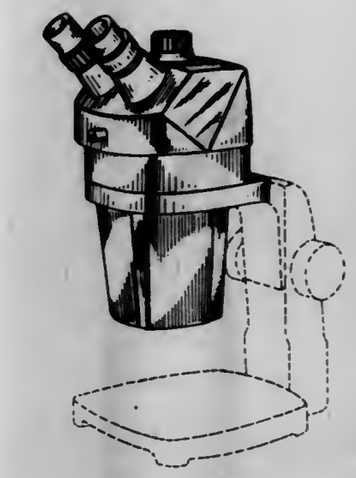
205,724
PHONOGRAPH SPINDLE ADAPTOR OR THE LIKE
Jack L. Kelly, Decatur, Ill., assignor to General Electric Company, a corporation of New York
Continuation of design applications Ser. No. 80,996, July 24, 1964 and Ser. No. 80,997, July 24, 1964. This application Oct. 20, 1965, Ser. No. 433
Term of patent 14 years
(Cl. D56—4)



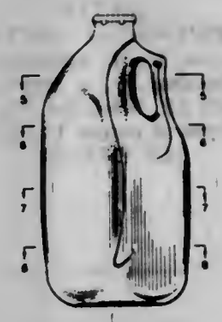
205,725
PORTABLE RADIO CABINET
Melvin H. Boldt, Glenview, Ill., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 3, 1966, Ser. No. 898
Term of patent 14 years
(Cl. D56—4)



205,726
PORTABLE RADIO CABINET
Melvin H. Boldt, Glenview, Ill., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 3, 1966, Ser. No. 911
Term of patent 14 years
(Cl. D56—4)



205,727
PORTABLE RADIO CABINET
Melvin H. Boldt, Glenview, Ill., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 4, 1966, Ser. No. 921
Term of patent 14 years
(Cl. D56—4)



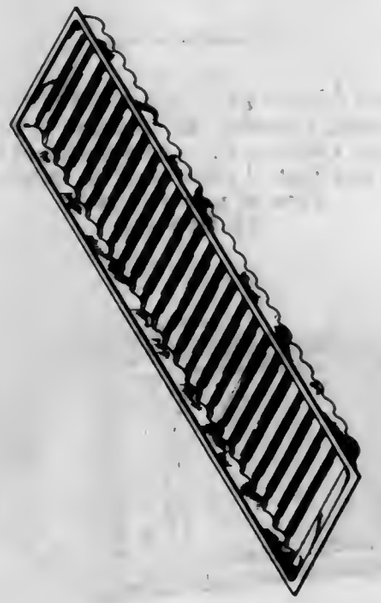
205,728
PORTABLE TELEVISION RECEIVER
Melvin H. Boldt, Glenview, Ill., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Sept. 3, 1965, Ser. No. 86,818
Term of patent 14 years
(Cl. D56—4)

205,729
STEREO MICROSCOPE
Paul A. Hoogesteger, Brighton, and Jacob W. Patia, Rochester, N.Y., assignors to Bausch & Lomb Incorporated, Rochester, N.Y., a corporation of New York
Filed June 30, 1965, Ser. No. 85,954
Term of patent 14 years
(Cl. D57—1)

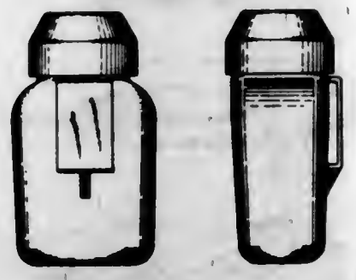
205,730
JUG
Richard L. Platte, Ann Arbor, Mich., assignor to Hoover Ball and Bearing Company, Saline, Mich.
Filed Sept. 13, 1965, Ser. No. 86,963
Term of patent 14 years
(Cl. D58—5)

205,731
BOTTLE
Edward D. Levy, 5 Forestdale Road, Spring Valley, N.Y.
Filed July 20, 1965, Ser. No. 86,219
Term of patent 14 years
(Cl. D58—6)

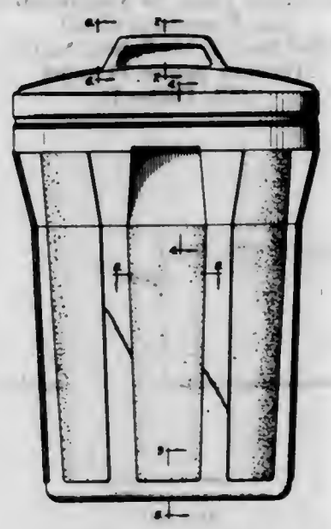
205,732
DISPENSING BOTTLE
Jerome Gould, Encino, Calif., assignor to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois
Filed July 2, 1964, Ser. No. 80,671
Term of patent 14 years
(Cl. D58—8)



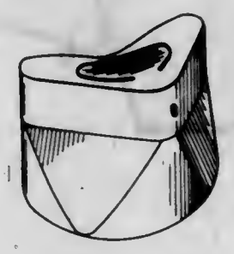
205,733
DISPENSING BOTTLE
Jerome Gould, Encino, Calif., assignor to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois
Filed July 30, 1964, Ser. No. 81,067
Term of patent 14 years
(Cl. D58—8)



205,734
COMBINED DECANTER AND CLOSURE THEREFOR
Ernest L. Du Pree, New York, N.Y., assignor to Schenley Industries, Inc., New York, N.Y., a corporation of Delaware
Filed Sept. 20, 1965, Ser. No. 87,080
Term of patent 14 years
(Cl. D58—8)



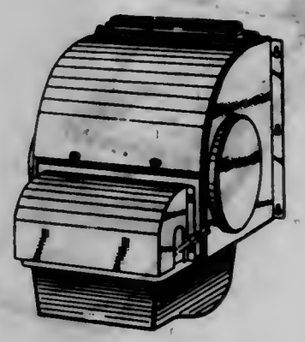
205,735
PACKAGING TRAY FOR CYLINDRICAL OBJECTS
Benjamin F. Weiner, North Belmore, N.Y., assignor to Chase Instruments Corporation, Long Island City, N.Y., a corporation of New York
Filed Mar. 12, 1965, Ser. No. 84,227
Term of patent 14 years
(Cl. D58—13)



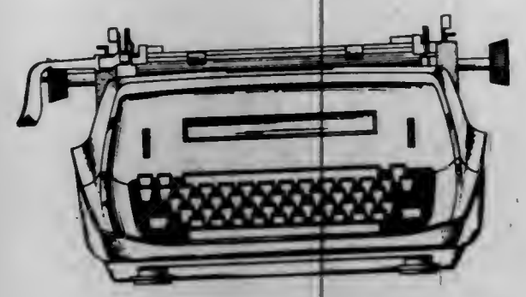
205,736
FOOD CONTAINER
Vincent Jordan, Star Rte. 2, Rhinelander, Wis.
Filed Sept. 13, 1965, Ser. No. 86,978
Term of patent 14 years
(Cl. D58—17)

205,737
WASTE RECEPTACLE
John D. Braught, Northbrook, Ill., assignor to General American Transportation Corporation, a corporation of New York
Filed Oct. 11, 1965, Ser. No. 87,392
Term of patent 14 years
(Cl. D58—17)

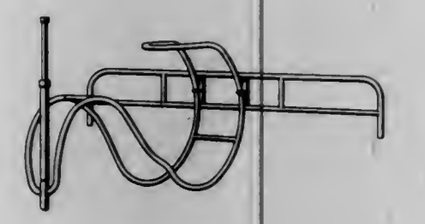
205,738
DISPENSER CAP FOR A PRESSURIZED CAN
Joseph Charles Pizzurro, Scarsdale, N.Y., assignor to Precision Valve Corporation, Yonkers, N.Y., a corporation of New York
Filed Dec. 16, 1965, Ser. No. 197
Term of patent 14 years
(Cl. D58—26)



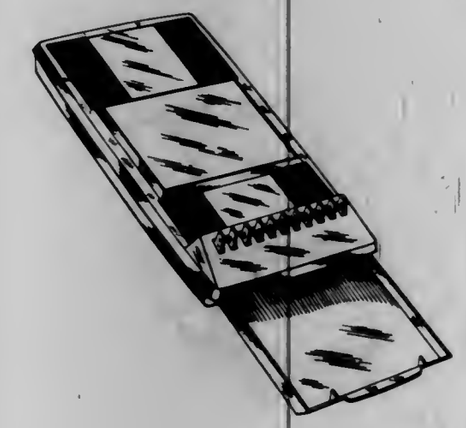
205,739
DISPENSER CAP FOR A PRESSURIZED CAN
Joseph Charles Pizzurro, Scarsdale, N.Y., assignor to Precision Valve Corporation, Yonkers, N.Y., a corporation of New York
Filed Dec. 16, 1965, Ser. No. 204
Term of patent 14 years
(Cl. D58—26)



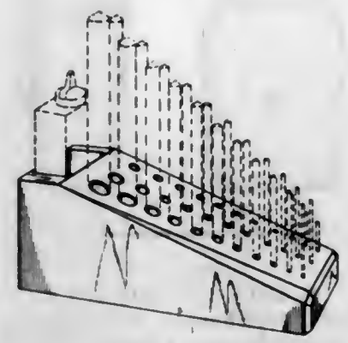
205,740
DISPENSER CAP FOR A PRESSURIZED CAN
Joseph Charles Pizzurro, Scarsdale, N.Y., assignor to Precision Valve Corporation, Yonkers, N.Y., a corporation of New York
Filed Dec. 16, 1965, Ser. No. 205
Term of patent 14 years
(Cl. D58—26)



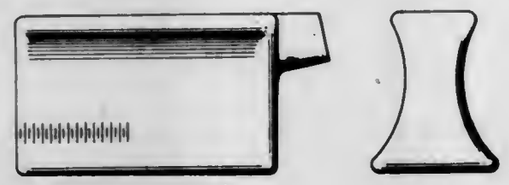
205,741
HUMIDIFIER
Leonard L. White, 19504 Stansbury, Detroit, Mich., and James H. McNelece, 200145 Woodhill Drive, Northville, Mich.
Filed Aug. 2, 1965, Ser. No. 86,390
Term of patent 14 years
(Cl. D62—4)



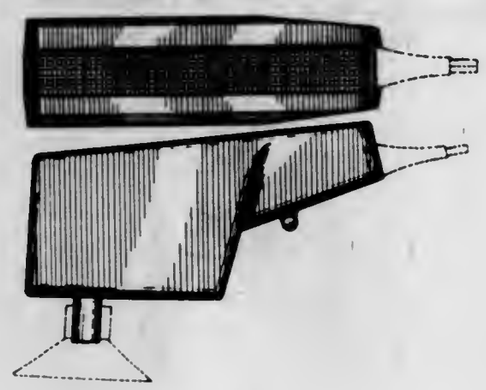
205,742
TYPEWRITER
Carl W. Sundberg, Bloomfield Hills, and Montgomery Ferar, Huntington Woods, Mich., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Oct. 1, 1965, Ser. No. 87,250
Term of patent 14 years
(Cl. D64—11)



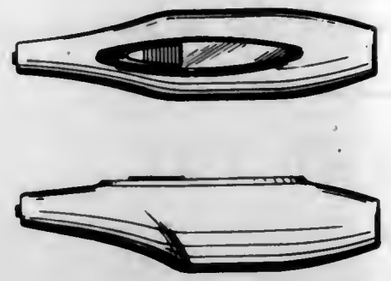
205,743
WATER CRAFT FRAME
Charles O. Hoover, 2132 Pearson Drive, Oklahoma City, Okla.
Filed Aug. 13, 1965, Ser. No. 86,578
Term of patent 14 years
(Cl. D71—1)



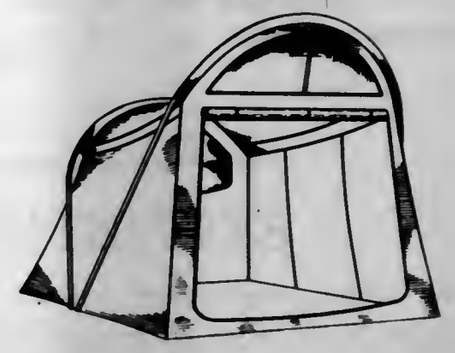
205,744
MEMORANDUM INDEX
Clayton A. Laughlin, Minneapolis, Minn., assignor to Standard Packaging Corporation, New York, N.Y., a corporation of Virginia
Filed Oct. 15, 1965, Ser. No. 87,498
Term of patent 14 years
(Cl. D74—1)



205,745
RACK FOR DRILL BITS, TAPS AND THE LIKE
Olie A. Nannfeldt, Pokagon Township, Cass County, Mich. (3102 M–40 North, Niles, Mich.)
Filed July 15, 1965, Ser. No. 86,168
Term of patent 7 years
(Cl. D80—9)



205,746
MALE URINAL
Edna Maria Cain, 74 Valparaiso St., San Francisco, Calif.
Filed Dec. 2, 1965, Ser. No. 24
Term of patent 14 years
(Cl. D83—1)



205,747
ELECTRIC VIBRATOR
Charles S. Myers, Evanston, Ill., assignor to Wahl Clipper Corporation, Sterling, Ill., a corporation of Illinois
Filed Jan. 5, 1965, Ser. No. 83,271
Term of patent 14 years
(Cl. D83—1)

205,748
HANDLE FOR MANICURING IMPLEMENT OR THE LIKE
Richard B. Hall, Akron, Ohio, assignor to Dominion Electric Corporation, a corporation of Ohio
Filed Feb. 7, 1966, Ser. No. 937
Term of patent 14 years
(Cl. D86—10)

205,749
TENT OR SIMILAR ARTICLE
Charles W. Moss, 5270 Geddes Road, Ann Arbor, Mich.
Filed June 30, 1965, Ser. No. 85,963
Term of patent 14 years
(Cl. D88—3)

LIST OF PLANT PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 13TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Kircher, George C. Peach tree. 2,671, 9–13–66, Cl. 42.

LIST OF DESIGN PATENTEES

Abbott Laboratories: *See*—
Gould, Jerome. 205,732.
Gould, Jerome. 205,733.

Artistic Wire Products Co., of Conn., Inc., The: *See*—
Christoffersen, Kurt. 205,715.
Curistoffersen, Kurt. 205,716.

Allen Electronics, Inc.: *See*—
Christine, William C., and Pierce. 205,702.

Barr, Irwin R.: *See*—
Schnepfe, Robert W., Jr., Pilarski, Barr, and Sylvester. 205,711.
Sylvester, David, Barr, Schnepfe, and Pilarski. 205,712.

Bausch & Lomb Inc.: *See*—
Hoogesteger, Paul A., and Petla. 205,729.

Belvedere Products Inc.: *See*—
Cowen, Theodore A., Jr. 205,707.

Boldt, Melvin H., to Zenith Radio Corp. Portable radio cabinet. 205,725, 9–13–66, Cl. D56—4.

Boldt, Melvin H., to Zenith Radio Corp. Portable radio cabinet. 205,726, 9–13–66, Cl. D56—4.

Boldt, Melvin H., to Zenith Radio Corp. Portable radio cabinet. 205,727, 9–13–66, Cl. D56—4.

Boldt, Melvin H., to Zenith Radio Corp. Portable television receiver. 205,728, 9–13–66, Cl. D56—4.

Bordner, Lee T., to Sierra Electric Corp. Electrical receptacle face plate. 205,708, 9–13–66, Cl. D26—1.

Braught, John D., to General American Transportation Corp. Waste receptacle. 205,737, 9–13–66, Cl. D58—17.

Cain, Edna M. Male urinal. 205,746, 9–13–66, Cl. D83—1.

Chase Instruments Corp.: *See*—
Weiner, Benjamin F. 205,735.

Christine, William C., and J. E. Pierce, to Allen Electronics, Inc. Cooler and dispenser unit for use in making cold beverages, drinks, soups and the like. 205,702, 9–13–66, Cl. D2—3.

Christoffersen, Kurt, to The Artistic Wire Products Co. of Conn., Inc. Baker's cooling rack. 205,715, 9–13–66, Cl. D44—29.

Christoffersen, Kurt, to The Artistic Wire Products Co. of Conn., Inc. Baker's cooling rack. 205,716, 9–13–66, Cl. D44—29.

Cincinnati Industries, Inc.: *See*—
Cohen, Howard S., and Palais. 205,723.

Cohen, Howard S., and G. Palais; ½ to Cincinnati Industries, Inc., ½ to Titan Molders Corp. Molded guitar carrying case shell. 205,723, 9–13–66, Cl. D56—1.

Cowan, Murray L., to Textron Inc. End link for a watch bracelet or similar article. 205,717, 9–13–66, Cl. D45—4.

Cowen, Theodore A., Jr., to Belvedere Products Inc. Upholstered chair. 205,707, 9–13–66, Cl. D15—1.

Dominion Electric Corp.: *See*—
Hall, Richard B. 205,748.

DuPree, Ernest L., to Schenley Industries, Inc. Combined decanter and closure therefor. 205,734, 9–13–66, Cl. D58—8.

Ferar, Montgomery: *See*—
Sundberg, Carl W. 205,742.

Pizzurro, Joseph C. 205,740.

Schenley Industries, Inc.: *See*—
DuPree, Ernest L. 205,734.

Schnepfe, Robert W., Jr., F. J. Pilarski, I. R. Barr, and D. Sylvester. Grenade for dispensing gases, liquids, or the like. 205,711, 9–13–66, Cl. D30—1.

Schnepfe, Robert W., Jr.: *See*—
Sylvester, David, Barr, Schnepfe, and Pilarski. 205,712.

Shore, Sherman, to Napco, Inc. Combined railing and end column. 205,706, 9–13–66, Cl. D13—7.

Sierra Electric Corp.: *See*—
Bordner, Lee T. 205,708.

Sperry Rand Corp.: *See*—
Sundberg, Carl W., and Ferar. 205,742.

Standard Packaging Corp.: *See*—
Laughlin, Clayton A. 205,744.

Sundberg, Carl W., and M. Ferar, to Sperry Rand Corp. Typewriter. 205,742, 9–13–66, Cl. D64—11.

Sunley, Herschel L. Combination locating-and-marking gauge for junction boxes. 205,722, 9–13–66, Cl. D52—6.

Sylvester, David: *See*—
Schnepfe, Robert W., Jr., Pilarski, Barr, and Sylvester. 205,711.

Sylvester, David, I. R. Barr, R. W. Schnepfe, Jr., and F. J. Pilarski. Grenade canister. 205,712, 9–13–66, Cl. D30—1.

Tankard Rae F., to International Business Machines Corp. Manual data entry keyboard console. 205,709, 9–13–66, Cl. D26—5.

Texas Boot Mfg. Co., Inc.: *See*—
Vise, Harry. 205,704.

Textron Inc.: *See*—
Cowan, Murray L. 205,717.

Trnka, Milton A. Pull toy. 205,714, 9–13–66, Cl. D34—15.

Villa, Luis F. Street lamp. 205,720, 9–13–66, Cl. D48—31.

Vise, Harry, to Texas Boot Mfg. Co., Inc. Cowboy boot. 205,704, 9–13–66, Cl. D7—7.
Wahl Clipper Corp.: *See*—
Myers, Charles S. 205,747.
Weiner, Benjamin F., to Chase Instruments Corp. Packaging tray for cylindrical objects. 205,735, 9–13–66, Cl. D58—13.
Wingfield-Wilson: *See*—
Wilson, Edmund C. 205,713.
White, Leonard L., and J. H. McNeiece. Humidifier. 205,741, 9–13–66, Cl. D62—4.
Wilson, Edmund C., to Wingfield-Wilson. Toy animal figure or similar article. 205,713, 9–13–66, Cl. D34—2.
Zenith Radio Corp.: *See*—
Boldt, Melvin H. 205,725.
Boldt, Melvin H. 205,726.
Boldt, Melvin H. 205,727.
Boldt, Melvin H. 205,728.

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 13TH DAY OF SEPTEMBER, 1966

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

ACF Industries, Inc.: *See*—
Bickhaus, James T. 3,272,486.
Carlson, Harold A. 3,272,482.
Cook, Forrest W., Bickhaus, and Smith. 3,272,487.
Martin, Charles L. 3,272,483.
Newman, Ottis E. 3,272,485.
A & D Fabricating Co., Inc.: *See*—
Dirubbo, Angelo. 3,272,257.
AGA Aktiebolag: *See*—
Mogensen, Sten. 3,272,893.
AMP Inc.: *See*—
Cobaugh, Robert F. 3,273,102.
API Instruments Co.: *See*—
Quittner, George F. 3,273,055.
Abbott Laboratories: *See*—
Von Esch, Anne M., and Crovetti. 3,272,828.
Von Esch, Anne M., and Crovetti. 3,272,833.
Abbott, Richard L., to Commercial Solvents Corp. Production of nitroalkanes. 3,272,874, 9–13–66, Cl. 260—644.
Abendroth, Robert V.: *See*—
Schmitter, Walter P., Abendroth, and Bernard. 3,273,000
Ackley, Charles E., to R. W. Hartnett Co. Article marking machine. 3,272,118, 9–13–66, Cl. 101—37.
Actis, Paul. Cutting and perforating press. 3,272,051, 9–13–66, Cl. 83—527.
Adams, Dale G., to United States of America, Army. Three-way fuze. 3,272,125, 9–13–66, Cl. 102—70.
Adams, Wayne W., and T. Garrison. Agricultural bale-handling machine. 3,272,352, 9–13–66, Cl. 214—7.
Adams-Russell Co., Inc.: *See*—
Curtis, John P. 3,273,079.
Addison Products Co.: *See*—
Knight, Verne C. 3,271,972.
Addressograph-Multigraph Corp.: *See*—
Johnson, Dean W. 3,272,120.
Schulze, Erwin F. C. 3,272,498.
Adise, Herbert H., to Computer Instruments Corp. Tonometer. 3,272,001, 9–13–66, Cl. 73—80.
Adzeries, Ramon M.: *See*—
Quiros, Alejandro M., and Adzeries. 3,273,116.
Aeroprojects Inc.: *See*—
Boyd, Charles A. 3,271,980.
African Explosives and Chemical Industries Ltd.: *See*—
Emby, Gordon N. 3,272,694.
Agie A.G. fur Industrielle Elektronik: *See*—
Strohmeier, Walter, Bernaldo de Quiros, and Ullmann. 3,273,041.
Agfa Aktiengesellschaft: *See*—
Czekalla, Roland. 3,272,106.
Rümpelein, Fritz, and Kopf. 3,273,061.
Ahrns, Wilbur C.: *See*—
De Witt, Frank A., and Ahrns. 3,272,306.
Air Placement Equipment Co., Inc.: *See*—
Pro, George M. 3,272,474.
Air Products and Chemicals, Inc.: *See*—
Doelp, Louis C., Jr. 3,272,760.
Erner, William E., Faarkas, and Graboyes. 3,272,763.
Woolfenden, Brian K. 3,272,520.
Ajac Corp., The: *See*—
Antonious, Anthony J. 3,272,412.
Aktiebolaget Mohogs Mekaniska Verkstad: *See*—
Baumi, Johannes H. 3,272,242.
Aktiebolaget Svenska Flaktfabriken: *See*—
Wallin, Sven. 3,272,415.
Alarm Device Mfg. Co.: *See*—
Malin, Jack. 3,273,090.
Alburn, Harvey E.: *See*—
Grant, Norman H., and Alburn. 3,272,715.
Alco Chemical Corp.: *See*—
Martin, Robert A. 3,272,749.
Alexander, Claude L., to American Can Co. Valve for pressure container. 3,272,403, 9–13–66, Cl. 222—394.
Alexander, David C., and R. H. Dennard, to International Business Machines Corp. Apparatus for translating a waveform. 3,272,995, 9–13–66, Cl. 307—88.5.
Alexander, Laurence R., to Leesona Corp. Delay timer. 3,273,070, 9–13–66, Cl. 328—84.
Alfa-Laval AB: *See*—
Troberg, Bengt E. M. 3,272,179.
Allard, Jules N., to United Shoe Machinery Corp. Shoe machines. 3,271,800, 9–13–66, Cl. 12—12.5.
Allbright, Norman J., and A. C. Boldon, said Allbright assor. to said Boldon. Rendering cooker with hydrostatic charging head. 3,272,599, 9–13–66, Cl. 23—290.5.
Alleaume, Jean H., and D. M. H. Hamel. Flexible and elastic tanks for transporting liquids in bulk. 3,272,373, 9–13–66, Cl. 220—9.
Allegany Instrument Co.: *See*—
Eckard, Ronald G. 3,272,006.
Allen Electric and Equipment Co.: *See*—
Rest, Frederick G., and Newsted. 3,271,938.
Allen, Herbert, to Cameron Iron Works, Inc. Blowout preventer. 3,272,222, 9–13–66, Cl. 137—315.
Allen, Jack W. T., and R. E. Anderson. Multiple connected transformer. 3,273,053, 9–13–66, Cl. 323—48.
Allen, Milton F., to Milton F. Allen Publications, Inc. Detection treatment of paper money and other negotiable paper. 3,272,533, 9–13–66, Cl. 283—7.
Allen, Milton F., Publications, Inc.: *See*—
Allen, Milton F. 3,272,533.
Allenbach, Charles R., T. A. Bradfield, P. E. Gunning, and D. R. Rink, to Union Carbide Corp. Aerosol valve. 3,272,442, 9–13–66, Cl. 239—579.
Allen-Bradley Co.: *See*—
Lawrence, Leland E. 3,272,949.
Allied Chemical Corp.: *See*—
Farah, Basil S., Gilbert, Jones, and Otto. 3,272,857.
Lau, Philip T. S., and Grillot. 3,272,699.
Mueller, Max B., and Largman. 3,272,764.
Spatz, Sydney M., and Steiner. 3,272,843.
Alsop, James F.: *See*—
Clark, Patrick A., Alsop, and Ogle. 3,272,312.
Amalaa Corp.: *See*—
Craig, Bryant F. 3,273,069.
Amalgamated Electric Corp.: *See*—
McRoberts, Charles E. 3,273,022.
Ambrose, Henry A., to Gulf Research & Development Co. Fuel oils. 3,272,605, 9–13–66, Cl. 44—51.
Amco Engineering Co.: *See*—
Anderson, Edwin V., and Mack. 3,272,582.
American Aniline Products, Inc.: *See*—
Taber, David, Renfrew, and Pons. 3,272,792.
American Aniline Products, Inc.: *See*—
Taber, David, Renfrew, and Pons. 3,272,793.
Taber, David, Renfrew, and Pons. 3,272,794.
American Biltrite Rubber Co., Inc.: *See*—
Holmstrom, Ernest R., Slosberg, and Smith. 3,272,688.
Marcus, Natalie S., Holmstrom, and Smith. 3,272,683.
American Bosch Arma Corp.: *See*—
Parenti, William C. 3,273,111.
American Can Co.: *See*—
Alexander, Claude L. 3,272,403.
Grimsley, Arvid K. 3,272,369.
American Chain & Cable Co.: *See*—
Sternberg, Huot W., and Robinson. 3,272,455.
American Cyanamid Co.: *See*—
Buell, Bennett G., and Long. 3,272,829.
Buell, Bennett G., and Long. 3,272,830.
Buell, Bennett G., and Long. 3,272,831.
Chopoorian, John A., and Loeffler. 3,272,646.
Millonis, Jerry P., Hardy, and Baitinger. 3,272,891.
American Home Products Corp.: *See*—
Grant, Norman H., and Alburn. 3,272,715.
Irvine, Douglas S., Bagli, Morand, Vezina, and Wiesner. 3,272,847.
Irvine, Douglas S., Bagli, Morand, Vezina, and Wiesner. 3,272,848.
Marshall, David J., and Revess. 3,272,801.
Wendt, Gerhard R., and Ledl. 3,272,849.
American Hospital Supply Corp.: *See*—
Staunt, Martin. 3,272,229.
American Machine & Foundry Co.: *See*—
Pratt, Aloysius W. 3,273,050.
Rulseh, Roger D. 3,272,931.
American Optical Co.: *See*—
Koester, Charles J., and Williams. 3,273,072.
Buckminster, Lloyd A. 3,271,912.
American Potash & Chemical Corp.: *See*—
Goodrow, Marvin H. 3,272,781.
Paciorek, Kazimiera J. L., and Kratzer. 3,272,846.
American Radiator & Standard Sanitary Corp.: *See*—
McMurtrie, Gilbert, Nagel, and Forth. 3,271,793.
American Seating Co.: *See*—
Barecki, Chester J., and Knapp. 3,272,555.
American Sterilizer Co.: *See*—
Huston, Alfred B. 3,272,589.
Amerio, Pasquale, and R. E. Minnich, to Amerio Refrigerating Equipment Co., Inc. Automatic contact plate freezers. 3,271,973, 9–13–66, Cl. 62—341.
Amerio Refrigerating Equipment Co., Inc.: *See*—
Amerio, Pasquale, and Minnich. 3,271,973.
Ametek, Inc.: *See*—
Easton, Le Roy H. 3,273,002.
Ancet, Victor M. J., and Marius Fayolle (also known as Marcel Fayolle). Mechanism for the control of weft threads in shuttleless looms. 3,272,236, 9–13–66, Cl. 139—122.
Anchor Hocking Glass Corp.: *See*—
Hildebrandt, Frederick V., Ochs, and Foss. 3,272,239.
Anderson, David H., to Bulova Watch Co., Inc. Watch casing with rotatable bezel. 3,271,945, 9–13–66, Cl. 58—43.
Anderson, Edwin V., and J. A. Mack, to Amco Engineering Co. Building components for constructing cabinets. 3,272,582, 9–13–66, Cl. 312—257.
Anderson, Ralph E.: *See*—
Allen, Jack W. T., and Anderson. 3,273,053.
Anderson, William H.: *See*—
Hanson, Roy R. 3,272,411.

Andersson, Karl R.: *See*—
Ohlund, John A. I., and Andersson. 3,272,510.
Andresen, Jack S., and A. B. MacLane, to Beckman Instruments, Inc. Thermal converter type R.M.S. meter utilizing signal storage and comparison. 3,273,059, 9–13–66, Cl. 324—106.
Andresen, John H., Jr., to Intercontinental Dynamics Corp. Pressure-actuated valve for use in aircraft. 3,272,608, 9–13–66, Cl. 98—1.5.
Ankerfarm S.p.A.: *See*—
Caputo, Ezio, and Zannini. 3,272,862.
Ansonia Wire & Cable Co., The: *See*—
Rollins, Gordon C., and Fallon. 3,272,911.
Anstey, Nigel A.: *See*—
Lerwill, William E., and Anstey. 3,273,113.
Anthony, Russel W., to National Broach & Machine Co. Expanding arbors. 3,272,041, 9–13–66, Cl. 82—44.
Antolini, Henry S. Earth-moving equipment. 3,272,264, 9–13–66, Cl. 172—273.
Antonious, Anthony J., to The Ajac Corp. Packet for carrying golf tees and discs. 3,272,412, 9–13–66, Cl. 224—26.
Apple, Garold E. Tree holding device. 3,272,462, 9–13–66, Cl. 248—44.
Arcamone, Federico, and A. Ferretti, to Societá Farmaceutici Italia. α-Hydroxy derivatives of dihydro-D-lysergic and 1-methyl-dihydro-D-lysergic ethylamides. 3,272,823, 9–13–66, Cl. 260—285.5.
Archer, Anthony H., to Louis Newmark Ltd., and T.M.M. (Research) Ltd. Apparatus for the detection of broken yarn and the like on textile machines. 3,272,048, 9–13–66, Cl. 83—370.
Archer, Sydney, C. F. Koelsch, R. R. Lorens, and B. F. Tullar, to Sterling Drug Inc. Process and intermediates for preparing indoles. 3,272,804, 9–13–66, Cl. 260—240.
Arend, Hildegard: *See*—
Belts, Klaus, Rodis, and Panter. 3,272,597.
Armour and Co.: *See*—
Gernandt, Louis E., and Oestreich. 3,271,813.
Schooley, Maurice A., and Shinn. 3,272,702.
Armour Pharmaceutical Co.: *See*—
Beekman, Stewart M. 3,272,704.
Rubino, Andrew M., Martin, and Garizio. 3,272,703.
Armstrong, Alfred: *See*—
Jacobs, William H., Nahikian, and Armstrong. 3,272,380.
Armstrong, Philip N. Digital sorting system. 3,273,127, 9–13–66, Cl. 340—172.5.
Artandi, Charles, and L. D. Bechtol, to Ethicon, Inc. Absorbable collagen prosthetic implant with nonabsorbable reinforcing strands. 3,272,204, 9–13–66, Cl. 128—334.
Asahi Kasei Kogyo Kabushiki Kaisha: *See*—
Ishida, Shinichi. 3,272,777.
Ishida, Shinichi. 3,272,778.
Asbury, Ray W., Sr. Conduit fitting. 3,272,539, 9–13–66, Cl. 285—332.4.
Ash, Eric A., E. A. F. Sell, T. M. Jackson, and L. A. Vinton, to International Standard Electric Corp. Tunable cavity resonator. 3,273,085, 9–13–66, Cl. 333—83.
Ashton, Robert, M. L. Gullickson, and J. G. Butler, to Massey-Ferguson Ltd. Corn harvester. 3,271,940, 9–13–66, Cl. 56—105.
Associated Electrical Industries Ltd.: *See*—
Warman, Bloomfield J. 3,272,924.
Associated Engineering Ltd.: *See*—
Westbrook, Michael H., and Skipworth. 3,272,187.
Aatheimer, Robert W., to Barnes Engineering Co. Combined radiometer and emissometer. 3,272,013, 9–13–66, Cl. 73—355.
Atkins, John H., and G. A. Wood, Jr., to Oversewing Machine Co. of America. Automatic feed apparatus for booksewing machine. 3,272,160, 9–13–66, Cl. 112—21.
Atlas Chemical Industries, Inc.: *See*—
Zech, John D., and Le Maistre. 3,272,845.
Atlas Copco Aktiebolag: *See*—
Ekstrom, Gösta I., and Nordahl. 3,272,035.
Frenl, Letterio. 3,272,357.
Atlas-Pacific Engineering Co.: *See*—
Blakewell, Roland F., Smith, and Loveland. 3,272,311.
Atomic Energy of Canada Ltd.: *See*—
Dunlop, Donald P., and Cousins. 3,272,226.
Au, Tin Y., and E. H. Olson, to E. I. du Pont de Nemours and Co. Method of manufacturing stockings from two-component filaments. 3,271,837, 9–13–66, Cl. 28—74.
Aubery, Francois. Packing machines. 3,271,925, 9–13–66, Cl. 53—128.
Audet, Allan C.: *See*—
Harrison, Walter G., Gary, and Audet. 3,272,354.
Aupee, Jean: *See*—
Kohn, Andre, and Aupee. 3,272,987.
Auto Research Corp.: *See*—
Thomas, Thomas R. 3,272,285.
Automatic Electric Laboratories, Inc.: *See*—
McKeon, Patrick E. 3,272,952.
Automation Industries, Inc.: *See*—
Stebbins, Larry O. 3,272,000.
Automotive Rubber Co., Inc.: *See*—
Millard, Phillip B. 3,272,904.
Avakian, Souren, to The Denver Chemical Mfg. Co. Method and apparatus for determining the sensitivity of body fluid infectants to drugs. 3,272,719, 9–13–66, Cl. 195—103.5.
Avco Corp.: *See*—
Bruck, George, and Freno. 3,272,909.
Inderhees, John A. 3,273,035.
Avellino, Sebastian. Toy boat. 3,272,173, 9–13–66, Cl. 115—22.3.
Averdieck, Edward P. Sliding adjustable drawer. 3,272,583, 9–13–66, Cl. 312—343.
Avery, Hazelton H., ½ to Rush Metal Products, Inc. Torque drive mechanism. 3,272,080, 9–13–66, Cl. 91—186.
Avery Products Corp.: *See*—
Craig, Burnie M. 3,272,301.
Avery, Ronald G.: *See*—
Gibson, Allan R., and Avery. 3,272,726.
Avoset Co.: *See*—
Ewry, Edwin. 3,272,323.
Baarsgard, Eli J. Swingable mailbox structure. 3,272,465, 9–13–66, Cl. 248—145.
Babbage, Thomas A.: *See*—
Luchford, Laurence R., and Babbage. 3,272,185.
Babcock & Wilcox Co., The: *See*—
Wiener, Murray. 3,271,961.
Bachman, William: *See*—
Wallerstein, Lawrence B., and Bachman. 3,271,922.
Badgley, Donald V.: *See*—
Corbin, Ralph L., Kruger, and Badgley. 3,272,656.
Baermann, Max. Magnetic heating and supporting device for moving elongated metal articles. 3,272,956, 9–13–66, Cl. 219—10.61.
Baermann, Max. Permanent magnet device for generating electrical energy. 3,273,001, 9–13–66, Cl. 310—152.
Bagli, Jehan F.: *See*—
Irvine, Douglas S., Bagli, Morand, Vezina, and Wiesner. 3,272,847.
Irvine, Douglas S., Bagli, Morand, Vezina, and Wiesner. 3,272,848.
Baitinger, William F., Jr.: *See*—
Millonia, Jerry P., Hardy, and Baitinger. 3,272,891.
Bakes, Hal H.: *See*—
Schwartz, Norman J., Taylor, and Bakes. 3,272,934.
Balaguer, Rodolfo R., to J. D. Hedges and Co. Ltd. Primary battery. 3,272,655, 9–13–66, Cl. 136—100.
Balamuth, Lewis, and A. Kuris, to Cavitron Ultrasonics Inc. Apparatus for joining thermoplastic sheet material with ultrasonic rotary vibrators. 3,272,682, 9–13–66, Cl. 156—580.
Baldwin-Lima-Hamilton Corp.: *See*—
Stulen, Walter H. 3,271,986.
Balk, Pieter, and M. H. Pilkuhn, to International Business Machines Corp. Majority carrier channel device using heterojunctions. 3,273,030, 9–13–66, Cl. 317—235.
Balkin, Burton E. Method for inducing state of reduced awareness. 3,272,198, 9–13–66, Cl. 128—1.
Ball Bros. Research Corp.: *See*—
Hackett, Kenneth R. 3,273,141.
Balsiger, Harold E., to Landis Tool Co. Master cam actuator. 3,271,905, 9–13–66, Cl. 51—101.
Bankauf, William F.: *See*—
Promin, Robert M., and Bankauf. 3,272,315.
Banks, William P.: *See*—
Hutchinson, Merle, and Banks. 3,272,731.
Barecki, Chester J., and R. T. Knapp, to American Seating Co. Adjustable back lounge chair. 3,272,535, 9–13–66, Cl. 297—369.
Barker, Robert S., to Halcon International, Inc. Preparation of aminated benzenes from hydroxy benzenes. 3,272,865, 9–13–66, Cl. 260—581.
Barley, Leo D., to Harris-Intertype Corp. Adjustable knife and clamp assembly. 3,272,050, 9–13–66, Cl. 83—390.
Barnes Engineering Co.: *See*—
Astheimer, Robert W. 3,272,013.
Barnes, Jeffery W., to Ferranti, Ltd. Gyro-vertical apparatus. 3,272,019, 9–13–66, Cl. 74—5.43.
Barnstead Still and Sterilizer Co.: *See*—
Smith, Verity O. 3,271,935.
Barnum, Leslie F. Molded pallet. 3,272,158, 9–13–66, Cl. 108—51.
Barrieres, Elie L.: *See*—
Edelman, David J., Kaye, and Barrieres. 3,272,126.
Barrows Industries, Inc.: *See*—
Crowley, William G. 3,272,184.
Barrows, Royal L.: *See*—
Dowd, Howard M., Barrows, Landry, Temple, and State Street Bank and Trust Co. 3,272,508.
Barthel, Gunther: *See*—
Hahndorff, Axel, and Barthel. 3,272,728.
Baskin, Herbert B., and R. E. Bonner, to International Business Machines Corp. Applied sequence identification device. 3,273,130, 9–13–66, Cl. 340—172.5.
Bassett, Arthur T., Jr., R. S. Gaugler, and K. E. Jenkins, to General Motors Corp. Tubular thermoelectric array. 3,272,639, 9–13–66, Cl. 136—203.
Bassoff, Arthur B.: *See*—
Gates, Thomas S., Davis, and Bassoff. 3,272,075.
Batelaan, Joost: *See*—
Bourgault, Pierre L., and Batelaan. 3,273,027.
Baum, Theodore M., to Koppers Co., Inc. Mechanism for feeding box blanks. 3,272,499, 9–13–66, Cl. 271—10.
Bauml, Johannes H., to Aktiebolaget Mohogs Mekaniska Verkstad. Device for sawing and stacking sheet material. 3,272,242, 9–13–66, Cl. 143—48.
Bausch & Lomb Inc.: *See*—
Benford, James R. 3,272,070.

Edwards, William R., and R. D. Wesselhoft, to Esso Research and Engineering Co. Production of normal pentenes. 3,272,886, 9–13–66, Cl. 260—677.

Egan, Frank K., & Co.: *See*—
Street, Louis F. 3,271,821.

Egbert, John P., to Criterion Metal Fabricators, Inc. Ball projecting device. 3,272,194, 9–13–66, Cl. 124—26.

Ehrlich, Joseph R. Frosting composition. 3,272,641, 9–13–66, Cl. 106—238.

Ekco Products Co.: *See*—
Paddock, Raymond E. 3,271,989.

Ekey, William J.: *See*—
Maitlen, John J., and Ekey. 3,272,137.

Ekstrom, Gösta I. and S. H. Nordahl, to Atlas Copco Aktiebolag. Hammer driven wrench. 3,272,035, 9–13–66, Cl. 81—523.

Electric & Musical Industries Ltd.: *See*—
De Peignefort Galloway, Robert, and Bull. 3,273,008.
James, Ivanhoe J. P., and Karwowski. 3,272,916.

Electricite de France-Service National: *See*—
Hainzelin, Jean. 3,272,928.

Electronic Specialty Co.: *See*—
Huckabee, Vandel C. 3,273,087.

Electronics & Alloys, Inc.: *See*—
Intrater, Josef, and Hill. 3,272,660.

Elektrophysikalische Anstalt Bernhard Berghaus: *See*—
Berghaus, Bernhard, and Staesche. 3,272,730.

Ellicott Machine Corp.: *See*—
Schmidt, Fred J. 3,272,477.

Elliott Brothers (London) Ltd.: *See*—
Ellis, Stafford M. 3,272,090.

Ellis, Bernard: *See*—
Booker, Sheila M., Ellis, and Petrow. 3,272,797.

Ellis, Stafford M., to Elliott Brothers (London) Ltd. Fail-safe hydraulic actuators. 3,272,090, 9–13–66, Cl. 92—140.

Elwell, Howard A., to Standard Oil Co. Fuel-dispensing system for assuring delivery of uncontaminated fuel. 3,272,337, 9–13–66, Cl. 210—136.

Emby, Gordon N., to African Explosives and Chemical Industries Ltd. Seven-lindane insecticidal fumigating composition and method. 3,272,694, 9–13–66, Cl. 167—30.

Emerson Electric Co., The: *See*—
Brundage, Robert W. 3,272,128.

Emerson, William H., to The B. F. Goodrich Co. Anechooc chamber. 3,273,150, 9–13–66, Cl. 343—18.

Emery, Michael B., to E. I. du Pont de Nemours and Co. Yarn handling mechanism. 3,272,416, 9–13–66, Cl. 226—97.

Emhart Corp.: *See*—
Welch, Nicholas A. 3,271,982.

England, Hilda M. Office mailing machines. 3,271,926, 9–13–66, Cl. 53—188.

Enzymic Malt Co. Ltd.: *See*—
Comrie, Alan A. D., and Dixon. 3,272,718.

Eppler, Richard A., and J. F. MacDowell, to Corning Glass Works. Method of making high-strength devitrified glass bodies. 3,272,610, 9–13–66, Cl. 65—33.

Erdey, Laszlo: *See*—
Paulik, Ferenc, and J., and Erdey. 3,271,996.

Erdman, Vadim N.: *See*—
Monroe, Harold R., and Erdman. 3,273,110.

Ericson, Alvin E.: *See*—
Sachs, John P., Kasting, and Ericson. 3,272,674.

Ericson, Eric A., to General Electric Co. Busway plug enclosure with mounting means. 3,272,372, 9–13–66, Cl. 220—3.9.

Ericson, Eric A., to General Electric Co. Polarizing means for busway plug. 3,273,103, 9–13–66, Cl. 339—22.

Erner, William E., A. Faarkas, and H. Graboyes, to Air Products and Chemicals, Inc. Polymerization catalysis. 3,272,763, 9–13–66, Cl. 260—2.5.

Erwin, Joseph O., Jr., and W. W. Hammel, Jr., to The Singer Co. Pattern control for tufting machine attachments. 3,272,163, 9–13–66, Cl. 112—79.

Esopi, Aldo J. Blade sharpener. 3,271,906, 9–13–66, Cl. 51—102.

Esser, Hermann: *See*—
Ewald, Gert, Zech, and Esser. 3,271,930.

Essex Wire Corp.: *See*—
Murphey, Lloyd H. 3,273,020.

Esso Research and Engineering Co.: *See*—
Edwards, William R., and Wesselhoft. 3,272,886.
Massa, Victor F. 3,272,005.
MacLaren, Donald D. 3,272,734.
Nelson, Joseph F. 3,272,642.
Porter, Walter J., Jr., Watts, and Robbins. 3,272,873.
Peet, Nick P. 3,272,720.
Petro, Anthony J., and Krystow. 3,272,736.

Esterline-Angus Instrument Co., Inc.: *See*—
Tuszynski, Alfons A. 3,273,042.

Ethicon, Inc.: *See*—
Artandi, Charles, and Bechtol. 3,272,204.

Ethyl Corp.: *See*—
Brown, Jerome E., Shapiro, and De Witt. 3,272,606.
Reich, Murray H. 3,272,779.
Sims, Leslie L. 3,272,637.

Eutectic Welding Alloys Corp.: *See*—
Quaas, Joseph F. 3,272,624.
Wasserman, Rene D., and Quaas. 3,272,963.

Evans, Phillip W.: *See*—
Conner, John W., Evans, Isacks, and Neiswender. 3,272,866.
Conner, John W., Evans, Isacks, and Neiswender. 3,272,867.

Evans Products Co.: *See*—
Zenczak, Piotr. 3,272,657.

Ewald, Gert, H. Zech, and H. Esser, to Knapsack-Griesheim Aktiengesellschaft. Pre-treatment of carriers for use in gas/liquid distributing chromatography. 3,271,930, 9–13–66, Cl. 55—67.

Ewing, Alvin L., J. O. Haw, and R. L. Terrell, to E. I. du Pont de Nemours and Co. Chuck for tubular cores. 3,272,447, 9–13–66, Cl. 242—46.5.

Ewry, Edwin, to Avoset Co. Device for the securance of an article such as a safety razor to an aerosol container. 3,272,323, 9–13–66, Cl. 206—47.

Expando Meter Co.: *See*—
Schneider, Kurt H. 3,273,060.

FMC Corp.: *See*—
Fuchs, Robert J. 3,272,588.

Faarkas, Adalbert: *See*—
Erner, William E., Faarkas, and Graboyes. 3,272,763.

Fair-Play Mfg. Co.: *See*—
Foster, Jacques Y., and Thompson. 3,273,140.

Falk Corp., The: *See*—
Schmitter, Walter P., and Bernard. 3,273,000.

Falkenberg, Gustave F., to Dimensional Products, Inc. Headphone assembly. 3,272,926, 9–13–66, Cl. 179—182.

Fallon, Martin, Jr.: *See*—
Burns, Harry J. 3,272,201.

Fallon, William A.: *See*—
Rollins, Gordon C., and Fallon. 3,272,911.

Fannin, Loyd W., to Monsanto Co. Purification of xylenes from styrene by distillation in the presence of combined azeotroping agent and solvent additive. 3,272,723, 9–13–66, Cl. 203—51.

Farah, Basil S., E. E. Gilbert, E. S. Jones, and J. A. Otto, to Allied Chemical Corp. Process for the preparation of aromatic carboxylic acids. 3,272,857, 9–13–66, Cl. 260—516.

Farbenfabriken Bayer Aktiengesellschaft: *See*—
Frohberger, Paul-Ernst, Schlor, Kress, and Heiss. 3,272,695.

Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning: *See*—
Herbst, Willy, and Ludwig. 3,272,662.

Farnsworth, John F., and S. MacDonald, to Koppers Co., Inc. Distributor. 3,272,561, 9–13–66, Cl. 302—28.

Faulkner, Richard R., to Hammond Machinery Builders, Inc. Work-holding device. 3,272,732, 9–13–66, Cl. 204—297.

Faure, Marc, to Societe Bertin & Cie. Movable platform resting on an air cushion enclosed inside at least one yielding preferably circular skirt. 3,272,275, 9–13–66, Cl. 180—7.

Fayolle, Marius: *See*—
Ancet, Victor M. J., and Fayolle. 3,272,236.

Fee, Basil S., to The Dow Chemical Co. Process of reducing the cake-forming tendency of potassium chloride and composition containing same. 3,272,593, 9–13–66, Cl. 23—89.

Fehr, Isaac N., and J. Russ, to Campbell Taggart Associated Bakeries, Inc. Method of controlling microorganisms in food products. 3,272,636, 9–13–66, Cl. 99—214.

Feltgen, Gerard. Tool. 3,272,479, 9–13–66, Cl. 259—73.

Fendler, Robert H., and A. Mitchel. Viscous fluid extrusion apparatus. 3,272,401, 9–13–66, Cl. 222—326.

Fenn, William W.: *See*—
Wood, Albert G., Fenn, Kegelman, and Halpern. 3,273,148.

Fennell, Anthony A. System for adding fluid fuel to furnace blast. 3,272,617, 9–13–66, Cl. 75—42.

Ferguson, Catherine M.: *See*—
Ferguson, James and C. M. 3,272,023.

Ferguson, James and C. M. Power-driven apparatus for oppositely reciprocating a pair of spaced members. 3,272,023, 9–13–66, Cl. 74—55.

Ferguson, Martin J. Sun shield. 3,271,778, 9–13–66, Cl. 2—12.

Fernseh G.m.b.H.: *See*—
Schneider, Hans-Dieter. 3,273,007.

Ferranti, Ltd.: *See*—
Barnes, Jeffery W. 3,272,019.

Ferretti, Aldo: *See*—
Arcamone, Federico, and Ferretti. 3,272,823.

Ferro Mfg. Corp.: *See*—
Moraczewski, Arthur. 3,272,544.
Pickles, Joseph. 3,272,545.

Fiberglas Canada Ltd.: *See*—
Dennis, William J. 3,271,825.

Fichted & Sachs A.G.: *See*—
Axthammer, Ludwig. 3,272,495.

Fields, William F. Means for dispersing water from a roof over adjacent land surface. 3,271,913, 9–13–66, Cl. 52—16.

Fischer, H. G., & Co.: *See*—
Fischer, Warren G. 3,273,015.

Fischer, Warren G., to H. G. Fischer & Co. Electrostatic spray gun system. 3,273,015, 9–13–66, Cl. 317—3.

Fishbein, William, to United States of America, Army. Narrow beam antenna system. 3,273,144, 9–13–66, Cl. 343—5.

Fisher, Arnold: *See*—
Pitkethly, Robert C., Ford, and Fisher. 3,272,887.

Flactiff, Thomas E., and M. R. Holmes, to Cronolux Corp. Time and temperature display sign. 3,273,139, 9–13–66, Cl. 340—334.

Flaherty, John J., and J. M. Mountz, to Magnaflux Corp. Eddy current testing system in which the power applying circuit has a low output impedance relative to the effective input impedance of the test coil unit. 3,273,056, 9–13–66, Cl. 324—40.

Flavel, Sidney, & Co. Ltd.: *See*—
Hughes, Francis, and Williams. 3,272,254.

Flegel, George J., R. L. Mielbeck, and R. D. Dirks, to Josam Mfg. Co. Plumbing fixture carrier. 3,271,794, 9–13–66, Cl. 4—252.

Flick, Francis S., and R. M. Morgan, to Flick-Reedy Corp. Convertible valve device. 3,272,221, 9–13–66, Cl. 137—270.

Flick-Reedy Corp.: *See*—
Flick, Francis S., and Morgan. 3,272,221.

Flinn, George E., to Borg-Warner Corp. Synchronizer. 3,272,291, 9–13–66, Cl. 192—53.

Flint, Edward F., to North American Aviation, Inc. Buoyancy system for underwater conductor cable. 3,272,910, 9–13–66, Cl. 174—101.5.

Flippo, Robert V., and L. H. Holmes, to LTV Electrosystems, Inc. Servo valve synchronizer. 3,272,062, 9–13–66, Cl. 91—384.

Flodell, Stig A. R., to K. A. Davidson. Hinge connection between the back and the seat of a chair and similar articles of furniture. 3,271,811, 9–13–66, Cl. 16—140.

Flook, William M., Jr., and P. A. Vance, Jr., to E. I. du Pont de Nemours and Co. Thermostatic switch employing a matching set of temperature responsive magnetic elements. 3,272,945, 9–13–66, Cl. 200—138.

Flygts Pumpar, Aktiebolaget: *See*—
Franzen, Ingmar. 3,272,136.

Flynn, George M., to Continental Can Co., Inc. Method and apparatus for forming "F" oblong can bodies. 3,271,984. 9–13–66, Cl. 72—210.

Focke, Heinz-Hermann, to Focke & Pfuhl. Method of and device for providing wrapping material with a pull strip. 3,272,673, 9–13–66, Cl. 156—266.

Focke & Pfuhl: *See*—
Focke, Heinz-Hermann. 3,272,673.

Follett, William E.: *See*—
Burton, John A., and Follett. 3,272,351.

Ford, John F.: *See*—
Pitkethly, Robert C., Ford, and Fisher. 3,272,887.

Ford Motor Co.: *See*—
Duffy, James J. 3,272,029.
Smalinskas, Steven. 3,272,032.

Forth, Edward W.: *See*—
McMurtrie, Gilbert, Nagel, and Forth. 3,271,793.

Foscarota, Valentino J. Testing instrument. 3,271,871, 9–13–66, Cl. 33—174.

Foster, Jacques Y., and L. J. Thompson, to Fair-Play Mfg. Co. Combination message and image display unit. 3,273,140, 9–13–66, Cl. 340—334.

Foster Wheeler Corp.: *See*—
Lorenzini, Robert A. 3,272,186.
Maier, Leo A., Jr., and Lorenzini. 3,272,961.

Fountain, George R.: *See*—
Pitzer, Edgar C., Fountain, and Ciaranello. 3,272,738.

Fourcade, Robert: *See*—
Duhoo, Marcel, Fourcade, Haberer, and Mennessier. 3,272,645.
Fournier, Daniel B., and U. A. Strang, to Jered Industries, Inc. Fluid-flow comparator for use in calibrating fluid-flow orifices. 3,271,994, 9–13–66, Cl. 73—3.
Fouts, Thomas R., E. G. Keiffer, and C. T. Wadlington, to Ling-Temco-Vought, Inc. Multi-polarized tracking antenna. 3,273,158, 9–13–66, Cl. 343—792.
Fox Products Co.: *See*—
Godshalk, James B., and Mediar. 3,273,039.
Frampton, Ronald C., to MacPennys Mist Propagation Ltd. Apparatus for watering plants. 3,272,225, 9–13–66, Cl. 137—408.
Franck, Pierre. Electromagnetic device, more particularly for use with contactors, relays and telebreakers. 3,272,940, 9–13–66, Cl. 200—105.
Frangos, John, to Revlon, Inc. Aerosol dispenser for plural fluids. 3,272,389, 9–13–66, Cl. 222—136.
Frangos, John, to Revlon, Inc. Aerosol dispensing apparatus. 3,272,402, 9–13–66, Cl. 222—394.
Frania, Josef, and F. Scheele, to Westinghouse Bremsen-Gesellschaft, m.b.H. Hydraulic pressure regulating valve. 3,272,220, 9–13–66, Cl. 137—116.5.
Frank, Robert K., to Holley Carburetor Co. Magnetic pulse generator ignition distributor. 3,272,930, 9–13–66, Cl. 200—19.
Frank, Wallace E., to The Franklin Institute. Detection and measurement device having a small flexible fiber transmission line. 3,273,447, 9–20–66, Cl. 88—1.
Franklin Institute, The: *See*—
Frank, Wallace E. 3,273,447.
Frantz, Virgil L., to Graham-White Sales Corp. Check valve having head and seat in removable cartridge. 3,272,219, 9–13–66, Cl. 137—112.
Franz Clouth Rheinische Gummiwarenfabrik: *See*—
Paasche, Fritz. 3,272,680.
Franz, Henry P., to Heinemann Electric Co. Circuit-breaker linkage auxiliary tripping arrangement. 3,273,089, 9–13–66, Cl. 335—166.
Franz, Raymond A., and R. N. Moore, to Monsanto Co. Olefin conversion to alicyclic hydrocarbons. 3,272,877, 9–13–66, Cl. 260—666.
Franzen, Ingmar, to Flygts Pumpar Aktiebolaget. Rotary pump unit. 3,272,136, 9–13–66, Cl. 103—87.
Fredholm, Gunnar I. Cover locking device for washing centrifuges. 3,272,296, 9–13–66, Cl. 192—136.
Freeman, Harold A. Language laboratory apparatus. 3,271,883, 9–13–66, Cl. 35—35.
Freeman, Sydney W., to General Signal Corp. Intermittent train control system. 3,272,980, 9–13–66, Cl. 246—63.
Freni, Letterio, to Atlas Copco Aktiebolag. Loading and transportation equipment. 3,272,357, 9–13–66, Cl. 214—41.
Freno, John F.: *See*—
Bruck, George, and Freno. 3,272,909.
Friden, Inc.: *See*—
De Witt, Frank A., and Ahrns. 3,272,306.
Friedman, Samuel: *See*—
Bohlinger, Ernst, and Friedman. 3,271,977.
Friedmann, Walter, to Pharma-Cosma A.G. Rotary brush for skin and body treatment. 3,272,200, 9–13–66, Cl. 128—56.
Frisch, Franz, to Sandoz Ltd. Mixtures of phenyl sulfonamido-halo-benzene azo amino-naphthol sulfonic acids. 3,272,586, 9–13–66, Cl. 8—26.
Frohberg, Paul-Ernst, H. Schlor, R. Kress, and R. Heiss, to Farbenfabriken Bayer Aktiengesellschaft. Vinyl-sulphonic acid ester fungicides. 3,272,695, 9–13–66, Cl. 167—30.
Fuchs, Robert J., to FMC Corp. Method of inhibiting corrosion with slowly soluble phosphate glasses. 3,272,588, 9–13–66, Cl. 21—2.7.
Fuelling, C. W., Inc.: *See*—
Cook, Robert W. 3,273,054.
Fujisawa Pharmaceutical Co, Ltd.: *See*—
Nakano, Hiroshi, Morimoto, Yoshimitsu, and Kimata. 3,272,832.
Fukumoto, Juichiro, and H. Negoro. Process for preparing thermally stable amylase composition. 3,272,717, 9–13–66, Cl. 195—68.
Fullbrook, Allan G., to Dominion Paper Box Co. Ltd. Method and apparatus for filling and sealing holders for tokens, coins or the like. 3,271,923, 9–13–66, Cl. 53—33.
Fuller, John R. D., to Bristol Siddeley Engines Ltd. Variable area nozzles. 3,271,948, 9–13–66, Cl. 60—35.55.
Funck, Dennis L.: *See*—
Busche, Robert M., and Funck. 3,272,771.
Fusco, Rosario. Portable demonstration shoe measuring device. 3,271,861, 9–13–66, Cl. 33—3.
GCA Corp.: *See*—
Herzog, Richard F., Sauermann, and McMahon. 3,272,984.
Gallagher, William R. Sewage disposal system. 3,272,338, 9–13–66, Cl. 210—177.

Herbst, Willy, and H. Ludwig, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Process for after-treating metal surfaces coated with crystalline anti-corrosion layers. 3,272,662, 9–13–66, Cl. 148—6.15.

Hercules Inc.: *See*—
Vandenberg, Edwin J. 3,272,889.

Hercules Powder Co.: *See*—
Geurden, Robert M. 3,272,640.

Her Majesty's Government of the United Kingdom, Minister of Aviation, of Great Britain and Northern Ireland: *See*—
Thomlinson, John. 3,272,460.

Herman, Daniel F., and A. L. Resnick, to National Lead Co. Method of making polymer coated substances and molding them into an article. 3,272,897, 9–13–66, Cl. 264—109.

Herschler, Robert J., and W. L. Shilling, to Crown Zellerbach Corp. Method of combatting aquatic living organisms. 3,272,614, 9–13–66, Cl. 71—2.7.

Herscovici, Stelian, to CSF-Compagnie Generale de Telegraphie Sans Fil. Pulses radar system. 3,273,147, 9–13–66, Cl. 343—7.7.

Herzog, Richard F., G. O. Sauermann, and W. J. McMahon, to GCA Corp. Electron multiplier for measuring the flow of positively charged particles. 3,272,984, 9–13–66, Cl. 250—83.

Heslin, Lawrence J. Device for checking thread pitch diameter concentricity. 3,271,872, 9–13–66, Cl. 33—199.

Hesse, Adolf, to Nordberg Mfg. Co. Yielding bowl locking ring for crushers. 3,272,446, 9–13–66, Cl. 241—215.

Heuff, Jack. Continuous process for addressing and forming envelopes. 3,272,095, 9–13–66, Cl. 93—61.

Hewlett-Packard Co.: *See*—
Cutler, Leonard S. 3,273,073.

Heyer, Walter E., and H. E. Mescher, to Pacific Scientific Co. Heat treating furnace with removable helical insert. 3,272,489, 9–13–66, Cl. 266—4.

Heyerdahl, Torjus B. Tone arm with retractable cartridge and stylus assembly. 3,272,514, 9–13–66, Cl. 274—24.

Heywood, Basil J., W. G. Leeds, and R. F. Collins, to May & Baker Ltd. Glucamine salts of benzonitriles. 3,272,795, 9–13–66, Cl. 260—211.

Hilbush, E. O.: *See*—
Roach, Robert L. 3,272,894.

Hildebrand, Helmut, to Hackethal Draht- und Kabel-Werke Aktiengesellschaft. High-frequency transmission line having plural coaxial conductors of different effective length between source and sink. 3,273,080, 9–13–66, Cl. 333—26.

Hildebrandt, Frederick V., C. S. Ochs, and G. J. Foss, to Anchor Hocking Glass Corp. Headspacer for containers. 3,272,239, 9–13–66, Cl. 141—168.

Hill, Clifford W., and E. A. Obuch, to Union Carbide Corp. Gas shielded arc torch. 3,272,958, 9–13–66, Cl. 219—75.

Hill, Lawrence R.: *See*—
Intrater, Josef, and Hill. 3,272,660.

Hillenbrand, William A., F. J. Burst, and W. D. Drew, to Hill-Rom Co., Inc. Hi-low frame for hospital bed. 3,271,795, 9–13–66, Cl. 5—63.

Hill-Rom Co., Inc.: *See*—
Hillenbrand, William A., Burst, and Drew. 3,271,795.

Hills, Henry C., to Nashua Corp. Photosensitive diazotype materials. 3,272,629, 9–13–66, Cl. 96—75.

Himy, Albert: *See*—
Solomon, Frank, and Himy. 3,272,653.

Hines, Kenneth M. Portable inflated waterway for toy boats. 3,271,896, 9–13–66, Cl. 46—87.

Hinsch, Karl: *See*—
Jorgji, Bernard, and Hinsch. 3,272,228.

Hitachi, Ltd.: *See*—
Kimura, Naokasu. 3,272,997.
Nakano, Seizo and H. 3,272,938.
Tomono, Msami, Koders, and Ueda. 3,272,661.

Hnilicka, Milo P., to National Research Corp. Elongated superconductive product. 3,273,092, 9–13–66, Cl. 335—216.

Hobson, Leland S. Tuned seismic wave communication system. 3,273,112, 9–13–66, Cl. 340—15.

Hock, Gerald A., to The Mead Corp. One-piece partitioned packing box. 3,272,420, 9–13–66, Cl. 229—27.

Hodge, Neville: *See*—
Sowden, Ronald G., and Hodge. 3,272,600.

Hodgson, Albert W. Machine tool pecking devices. 3,273,425, 9–20–66, Cl. 77—32.28.

Hodgson, George T., Jr.: *See*—
Rafferty, John W., and Hodgson. 3,272,585.

Hoehmann, Henry G., to International Business Machines Corp. Pneumatic carrier selector valve, decelerator and hold mechanism. 3,272,456, 9–13–66, Cl. 243—29.

Hoenisch, Walter H., to King-Seeley Thermos Co. Ice vending machine. 3,272,300, 9–13–66, Cl. 194—2.

Hoepli, Max H.: *See*—
Karnath, Gunther. 3,271,968.

Hoff, Rodney G., E. V. Clark, Jr., and C. C. Weeks, to North American Aviation, Inc. Thermionic diode converter system. 3,273,048, 9–13–66, Cl. 322—2.

Hoffman, Clarence A.: *See*—
Gitchel, Wayne B., Hoffman, and Schoeffel. 3,272,740.

Hoffman, Daniel J. N., and T. B. Beeton, to South African Iron and Steel Industrial Corp. Ltd. Production of spheroidized particles. 3,272,615, 9–13–66, Cl. 75—.5.

Hoffman Electronics Corp.: *See*—
Ross, Bernd. 3,273,029.

Hoffman, Joseph H., to Westinghouse Electric Corp. Pressurized seals for the shafts of fans. 3,272,516, 9–13–66, Cl. 277—4.

Hoffmann-La Roche Inc.: *See*—
Bollag, Werner, Gutmann, Hegedus, Kaiser, Langemann, Muller, and Zeller. 3,272,839.

Hoffmann, Richard W.: *See*—
Connoy, Eugene N., Hoffmann, Parkin, and Whitmore. 3,272,138.

Hoffsommer, Robert D., Jr., D. Taub, and N. L. Wendler, to Merck & Co., Inc. Process for preparing 5-(3-aminopropylidene)-5H-dibenzo[a, d]cycloheptene and 5H-dibenzo[a, d]-10,11-dihydro-cycloheptene derivatives. 3,272,864, 9–13–66, Cl. 260—570.8.

Holcombe, Alexander H., and S. R. Koch, to Union Carbide Corp. Apparatus for cryogenic liquid storage containers. 3,272,375, 9–13–66, Cl. 220—15.

Holden, Kenneth G., to Smith, Kline & French Laboratories. 2,2-ethylenetestosterones. 3,272,803, 9–13–66, Cl. 260—239.55.

Holden, Kenneth G., and J. F. Kerwin, to Smith, Kline & French Laboratories. 11,19-substituted progesterones. 3,272,799, 9–13–66, Cl. 260—239.55.

Holdtite Corp.: *See*—
P'Simer, George M. 3,272,554.

Holley Carburetor Co.: *See*—
Dziedzic, Walter F. 3,272,091.
Frank, Robert K. 3,272,930.
Lucas, Alvin S., and Saussele. 3,272,486.
Marsee, Frederick J., Soeters, and Karasinski. 3,271,954.
McCabe, Ralph P., and Wheeler. 3,271,950.
Soeters, Raymond A. 3,272,086.

Hollichem Corp.: *See*—
Shibe, William J., Jr., and Sittenfield. 3,272,751.

Holloway, Jesse C., to Collins Radio Co. Log periodic antenna comprised of parallel-fed quad elements. 3,273,159, 9–13–66, Cl. 343—792.5.

Holmes, John W. Light sources. 3,272,977, 9–13–66, Cl. 240—11.2.

Holmes, Lloyd H.: *See*—
Flippo, Robert V., and Holmes. 3,272,062.

Holmes, Melvin R.: *See*—
Flactiff, Thomas E., and Holmes. 3,273,139.

Holmstrom, Ernest R.: *See*—
Marcus, Natalie S., Holmstrom, and Smith. 3,272,683.

Holmstrom, Ernest R., D. K. Sloseberg, and M. M. Smith, to American Biltrite Rubber Co., Inc. Vinyl sponge laminate. 3,272,688, 9–13–66, Cl. 161—161.

Holsbock, Werner G., and C. J. Mall, to Sperry Rand Corp. Power transmission. 3,271,955, 9–13–66, Cl. 60—53.

Honeywell Inc.: *See*—
Davidson, Thomas J. 3,272,432.
Pendleton, Robert A. 3,272,450.

Schmidt, Roger N. 3,272,986.
Wilks, Robert S. 3,272,078.

Hooley, Eldon R. Poultry head remover. 3,271,815, 9–13–66, Cl. 17—12.

Hopff, Heinrich, and G. Kormany, to J. R. Geigy A.G. Process for the production of diene adducts of hexaethylidene-cyclohexane. 3,272,815, 9–13–66, Cl. 260—250.

Horizons Inc.: *See*—
Sprague, Robert H., Stewart, and Lewis. 3,272,635.

Horne, Ronald, T. W. McGlaughlin, and J. L. Marshall, Jr., to Monsanto Co. Pneumatic denier monitoring apparatus. 3,271,997, 9–13–66, Cl. 73—37.7.

Horowitz, Norman, and P. Spigner. Dental equipment stand. 3,271,859, 9–13–66, Cl. 32—22.

Horwitt, Laurence G., to Casco Products Corp. Dispensing apparatus for fire extinguishers. 3,272,890, 9–13–66, Cl. 222—153.

Houilleres du Bassin du Nord et du Pas de-Calais: *See*—
Duhoo, Marcel, Fourcade, Haberer, and Mennessier. 3,272,645.

Houston, Herbert J., to Slater Steel Industries Ltd. Locking device for use on suspension clamps and the like. 3,272,249, 9–13–66, Cl. 151—6.

Houvener, Irving S., and A. J. Palfey, to The Dow Chemical Co. Expandable dowel. 3,273,444, 9–20–66, Cl. 85—79.

Hovercraft Development Ltd.: *See*—
Cockerell, Christopher S. 3,272,271.
Hall, Kenneth, Bliss, and Charity. 3,272,272.

Howard, George C., and W. G. Bearden, to Pan American Petroleum Corp. Casing packer. 3,272,517, 9–13–66, Cl. 277—26.

Howard, Frank, and A. Langas, to Signode Corp. Magazine closure and guide assembly for stapling implements. 3,272,417, 9–13–66, Cl. 227—123.

Howland, Louis H., V. S. Chambers, and R. MacFarlane, Jr., to United States Rubber Co. Synthetic rubber latex prepared using polyoxyethylated castor oil and anionic dispersing agents. 3,272,767, 9–13–66, Cl. 260—23.7.

Hoya, Wallace K.: *See*—
Biel, John H., and Hoya. 3,272,807.

Hsia, Shwang: *See*—
Uber, Jay J., and Hsia. 3,272,121.

Hubbard, Arthur R., to United Shoe Machinery Corp. Adhesive activator for shoe lasting machines. 3,271,799, 9–13–66, Cl. 12—12.

Hubner, Walter, G. Myska, and H. Riemer, to Durkoppwerke Aktiengesellschaft. Apparatus for cross-cutting elongated webs of fabric. 3,273,435, 9–20–66, Cl. 83—210.

Huckabee, Vandel C., to Electronic Specialty Co. Miniaturized relay. 3,273,087, 9–13–66, Cl. 335—128.

Hudson, H. D., Mfg. Co.: *See*—
Schommer, Jule P. 3,272,180.

Huff, James B.: *See*—
Easton, Joe A. 3,272,287.

Hughes Aircraft Co.: *See*—

Jucker, Ernst, Ebnöther, Stoll, Bastian, and Rissi. 3,272,826.

Sankyo Co. Ltd.: *See*—
Tanabe, Katsumi, Takasaki, Hayashi, Morisawa, Hashimoto, and Okada. 3,272,800.

Sardee Corp., The: *See*—
Sarovich, Steve. 3,273,313.

Sarff, Forest M. Bathtub elevating seat. 3,271,791, 9-13-66, Cl. 4—185.

Sarovich, Steve, to The Sardee Corp. Upward magnetic can conveyor. 3,272,313, 9-13-66, Cl. 198—41.

Sartomer Resins, Inc.: *See*—
Gowman, Daniel J. 3,272,766.

Sass, Hans G., to Industrie-Companie Kleinewefers Konstrucktions-und Handelsgesellschaft, m.b.H., Firma. Rotatable shutter valve. 3,272,223, 9-13-66, Cl. 137—340.

Sauermann, Gerhard O.: *See*—
Hersog, Richard F., Sauermann, and McMahon. 3,272,984.

Saussele, Charles W.: *See*—
Lucas, Alvin S., and Saussele. 3,272,486.

Sawyer, Leslie F., to Colonial Silver Co., Inc. Toothbrush having a removable brush head. 3,271,805, 9-13-66, Cl. 15—176.

Saxman, Theodore E., to The B. F. Goodrich Co. Lining for acid tanks and method of use. 3,272,318, 9-13-66, Cl. 206—2.

Saydlowski, Bernard K., to E. I. du Pont de Nemours and Co. Air knife. 3,272,176, 9-13-66, Cl. 118—63.

Schaevitz Engineering: *See*—
Lipshutz, Joseph. 3,273,096.

Schafer, Heins: *See*—
Sus, Oskar, Rauhut, and Schafer. 3,272,627.

Schalit, Samuel: *See*—
Cutler, Royal A., and Schalit. 3,272,814.
Cutler, Royal A., and Schalit. 3,272,863.

Schallenberg, Elmer E., R. G. Lacoste, and H. D. Kluge, deceased by H. E. Kluge, administratrix, to Texaco Inc. Lubricant containing alkylene oxide reaction products. 3,272,744, 9-13-66, Cl. 252—32.7.

Scharff, Lynton L.: *See*—
Gruber, Leslie G., and Scharff. 3,271,866.

Schauer, Ralph F.: *See*—
Mullery, Alvin P., and Schauer. 3,273,129.

Scheele, Fritz: *See*—
Frania, Josef, and Scheele. 3,272,220.

Schefer, Eli I., and A. E. Rokhsar, to Revlon, Inc. Dispenser for strip material. 3,272,414, 9-13-66, Cl. 225—45.

Schierman, Joseph A.: *See*—
Hanson, Roy R. 3,272,411.

Schlage, Ernest L., to Schlage Lock Co. Magnetic locking device and method of combinating the same. 3,271,983, 9-13-66, Cl. 70—276.

Schlage Lock Co.: *See*—
Schlage, Ernest L. 3,271,983.

Schlör, Hansheimut: *See*—
Frohberger, Paul-Ernst, Schlör, Kress, and Heiss. 3,272,695.

Schlossberg, Louis, E. E. Logue, and P. J. Carrier, to Detrex Chemical Industries, Inc. Composition and method for coating metal surfaces. 3,272 664, 9-13-66, Cl. 148—6.17.

Schmeckenbecher, Arnold F., to International Business Machines Corp. Process for electroplating magnetic alloy onto a platinized chromium substrate. 3,272,727, 9-13-66, Cl. 204—29.

Schmeider, William S., and A. P. Corella, 10% to V. M. Rodgers. Multiple compartment package. 3,272,324, 9-13-66, Cl. 206—47.

Schmidt, Fred J., to Ellicott Machine Corp. Hydraulic spud lifting arrangement for dredges. 3,272,477, 9-13-66, Cl. 254—93.

Schmidt, Roger N., to Honeywell Inc. Solar heat absorbers comprising alternate layers of metal and dielectric material. 3,272,986, 9-13-66, Cl. 250—86.

Schmitter, Lonise A.: *See*—
Schmitter, Walter P., and Bernard. 3,273,000.

Schmitter, Walter P., deceased (by L. A. Schmitter, and R. V. Abendroth, co-executors), and D. G. Bernard, to The Falk Corp. Variable speed thru-motor drive. 3,273,000, 9-13-66, Cl. 310—98.

Schneider, Hans-Dieter, to Fernseh G.m.b.H. Circuit arrangement for producing a sawtooth waveform of high linearity. 3,273,007, 9-13-66, Cl. 315—27.

Schneider, Jack M., to Calmec (Manufacturing) Ltd. Apparatus for moulding articles from plastic materials. 3,271,816, 9-13-66, Cl. 18—4.

Schneider, Jos., & Co., Optische Werke: *See*—
Klemt, Gunter, and Macher. 3,272,073.

Schneider, Julius E., to Phillips Petroleum Co. Oil removal from liquid refrigerant. 3,272,735, 9-13-66, Cl. 208—341.

Schneider, Kurt H., to Expando Meter Co. Expanded scale ammeter including a bridge biased transistor differential amplifier. 3,273,060, 9-13-66, Cl. 324—131.

Schneider, Richard C., and D. C. Stelts. Therapeutic bath fluid circulating apparatus. 3,271,790, 9-13-66, Cl. 4—180.

Schnoebelen, Carl V. Delivery device for a duplicating machine or the like. 3,272,504, 9-13-66, Cl. 271—68.

Schoeffel, Eugene W.: *See*—
Earle, John S., Schoeffel, and Zimmermann. 3,272,739.
Gitchel, Wayne B., Hoffman, and Schoeffel. 3,272,740.

Schoenmakers, Johannes J. M., to North America Philips Co., Inc. Storage case for a tape cartridge. 3,272,325, 9-13-66, Cl. 206—52.

Schommer, Jule P., to H. D. Hudson Mfg. Co. Animal feed proportioning and mixing apparatus. 3,272,180, 9-13-66, Cl. 119—52.

Schooley, Maurice A., and B. M. Shinn, to Armour and Co. Growth promotant process. 3,272,702, 9-13-66, Cl. 167—53.

Schrader, Charles L., and L. W. Ramstrom, to Ingersoll-Rand Co. Rotary impact tool. 3,272,265, 9-13-66, Cl. 173—93.

Schray, Walter H., to United Steel & Wire Co. Stacking and nesting case. 3,272,377, 9-13-66, Cl. 220—19.

Schuetz, John R., to Drott Mfg. Corp. Transmission and steering control mechanism for material handling vehicle. 3,272,280, 9-13-66, Cl. 180—77.

Schulze, Erwin F. C., to Addressograph Multigraph Corp. Intermittent drive for card feed devices or the like. 3,272,498, 9-13-66, Cl. 271—8.

Schuster, Donald H. Regulated conversion system. 3,273,040, 9-13-66, Cl. 321—2.

Schwain, Frank R.: *See*—
Koren, Paul M., and Schwain. 3,272,634.

Schwarts, Norman J., N. E. Taylor, and H. H. Bakes, to Heinemann Electric Co. Circuit breaker unit for abnormally high inrush currents and/or inrush currents of long duration. 3,272,934, 9-13-66, Cl. 200—50.

Schwartz, Sol. Device for packing fabric. 3,272,449, 9-13-66, 242—62.

Schweizer, Hans R., to Eastman Kodak Co. Delta form of quinacridone. 3,272,821, 9-13-66, Cl. 260—279.

Scoggin, Jack S., and L. T. Price, to Phillips Petroleum Co. Extraction of soluble matter from polymer solids. 3,272,787, 9-13-66, Cl. 260—93.7.

Scott, Jerald J.: *See*—
Brand, Bruce B., and Scott. 3,272,484.

Scoville, Andrew E.: *See*—
Yamron, Joseph, and Scoville. 3,272,972.

Seacord, John M.: *See*—
Peterson, Richard C., and Seacord. 3,273,057.

Seale, Virgil L.: *See*—
Kirkpatrick, Willard H., and Seale. 3,272,757.

Searle, G. D., & Co.: *See*—
Lowrie, Harman S. 3,272,808.
Lowrie, Harman S. 3,272,818.
Papesch, Viktor. 3,272,816.

Seckerson, Clifford A., to United-Carr Inc. Fasteners. 3,272,061, 9-13-66, Cl. 85—82.

Sefcik, Robert, to J. Chun & Co. Musical top. 3,272,054, 9-13-66, Cl. 84—83.

Sefton, Robert C., to Koppers Co., Inc. Lightweight concrete. 3,272,765, 9-13-66, Cl. 260—2.5.

Segawa, Kaoru, and H. Osaki, to Nippon Electric Co., Ltd. Printing mechanism for typewriters having plural type-wheels. 3,272,302, 9-13-66, Cl. 197—50.

Seiz, Richard: *See*—
Lorenz, Albert, Muller, Reinchelt, Rosenstock, and Seiz. 3,272,175.

Sekely, Michael E., to Radio Corp. of America. Integrated electrical circuit. 3,272,989, 9-13-66, Cl. 307—88.5.

Sell, Eric A. F.: *See*—
Ash, Eric A., Sell, Jackson, and Vinton. 3,273,085.

Seney, John S., to E. I. du Pont de Nemours and Co. High speed scanning system. 3,272,012, 9-13-66, Cl. 73—341.

Separator Aktiebolaget: *See*—
Thylefors, Henric W. 3,272,430.

Service D'Exploitation Industrielle des Tabacs et des Allumettes: *See*—
Pietrucci, Andre. 3,272,333.

Seulen, Gerhard, and H. Kuhlkars, to Deutsche Edelstahlwerke Aktiengesellschaft, and Allgemeine Elektricitats-Gesellschaft. Method of heating by induction. 3,272,954, 9-13-66, Cl. 219—10.43.

Shadan, Anna M., to Continental Oil Co. Method of improving the wet strength of paper by addition of ethylene-vinyl acetate copolymer thereto. 3,272,690, 9-13-66, Cl. 162—169.

Shano, Charles L., to Motorola Inc. Voltage regulator. 3,273,049, 9-13-66, Cl. 322—28.

Shapiro, Gustave, and R. O. Stone, to United States of America, Commerce. Indenting recorder with illumination means. 3,273,160, 9-13-66, Cl. 346—77.

Shapiro, Hymin: *See*—
Brown, Jerome E., Shapiro, and De Witt. 3,272,606.

Sharpe, Frederick P., to Kelsey-Hayes Co. Adjustable stroke intermittent sheet feeder having plural shuttle means. 3,272,501, 9-13-66, Cl. 271—55.

Shelton, Stephen M., H. G. Poole, and F. R. Wagy, to Oregon Metallurgical Corp. Consumable electrode production of metal ingots. 3,271,828, 9-13-66, Cl. 22—200.

Shenango Ceramics, Inc.: *See*—
Rech, William J. 3,272,895.

Shepard, Francis H., Jr. Electric switch arrangement. 3,273,013, 9-13-66, Cl. 315—168.

Shepard, Lyman K.: *See*—
Solski, Frank A., and Shepard. 3,271,840.

Shepherd, William T., to Texaco Inc. Fire resistant hydraulic fluid. 3,272,747, 9-13-66, Cl. 252—78.

Shera, Brian L., to Pennsalt Chemicals Corp. Apparatus for continuously chlorinating pulp including automatic control of the degree of chlorination. 3,272,691, 9-13-66, Cl. 162—252.

Sherman, Charles A., to Weyerhaeuser Co. Impulse relay. 3,273,024, 9-13-66, Cl. 317—157.

Sherman, David A. Litter barrel mount. 3,272,466, 9-13-66, Cl. 248—146.

Shibe, William J., Jr., and M. Sittenfield, to Hollichem Corp. Cleaning agents containing cyclic imide addition products. 3,272,751, 9-13-66, Cl. 252—106.

Shibuya, Shozo: *See*—
Ito, Jinichi, Shibuya, and Yamada. 3,272,065.

Shields, James R., to Carrier Corp. Heat transfer apparatus having means to separate condensed liquid from the system fluid. 3,271,934, 9-13-66, Cl. 55—269.

Shields, James R., to Carrier Corp. Heat transfer apparatus. 3,272,259, 9-13-66, Cl. 165—158.

Shilling, Wilbur L.: *See*—
Herschler, Robert J., and Shilling. 3,272,614.

Shimizu, Akira, K. Igarashi, J. Hashimoto, deceased (by S. Hashimoto, executor), to Koei Chemical Co., Ltd. Method of producing pyridine. 3,272,825, 9-13-66, Cl. 260—290.

Shinn, Byron M.: *See*—
Schooley, Maurice A., and Shinn. 3,272,702.

Shinn, Charles E., to Royal Typewriter Co., Inc. Xerographic method. 3,272,626, 9-13-66, Cl. 96—1.

Shiraeff, Dimitry A., to General Aniline & Film Corp. Compositions of polymeric N-vinyl-organic compounds and perchloric acid. 3,272,755, 9-13-66, Cl. 252—187.

Shnable, Jack D.: *See*—
Winestock, Bernard J., and Shnable. 3,273,037.

Shrewsbury, Raymond W., to Minnesota Mining and Mfg. Co. Card selector. 3,272,205, 9-13-66, Cl. 129—16.1.

Shugarts, Robert H.: *See*—
Sorenson, Wayne P., Shugarts, and Rilhi. 3,272,178.

Shupe, Irwin S., to Sterling Drug Inc. Stabilized aqueous solution of tetracaine salt. 3,272,700, 9-13-66, Cl. 167—52.

Siegle, John C., and J. Teti, Jr., to E. I. du Pont de Nemours and Co. Submerged arc welding process and flux composition utilising fluorocarbon. 3,272,667, 9-13-66, Cl. 148—23.

Siemens, Halske Akteingesellschaft: *See*—
Kunemund, Friedrich. 3,273,064.

Signode Corp.: *See*—
Howard, Frank, and Langas. 3,272,417.
Langas, Arthur. 3,272,267.
Otto, Howard K. 3,272,113.

Silvern, David H., and K. E. Nichols, to Sundstrand Corp. Turbine cooling device. 3,271,952, 9-13-66, Cl. 60—39.66.

Simmons, Joe J., to Ideal Development Co. Removable dental appliances and methods of making same. 3,271,858, 9-13-Cl. 32—5.

Simpson, George H.: *See*—
Ricker, William C., and Simpson. 3,272,944.

Simpson, Herbert, Corp.: *See*—
Kaufman, John H. 3,272,562.

Sims, James G., to Monsanto Co. Textile filament having apparent variable denier. 3,272,901, 9-13-66, Cl. 264—177.

Sims, Leslie L., to Ethyl Corp. Polish emulsions of symmetrical wax esters of acetylenedicarboxylic acid and saturated alcohols. 3,272,637, 9-13-66, Cl. 106—10.

Sinclair Research, Inc.: *See*—
Case, Everett N., Patinkin, and Young. 3,272,607.
Stahly, Eldon E. 3,272,679.

Spohr, Albert R., to Sunbeam Corp. Vibrator motor for electric shaver. 3,272,998, 9–13–66, Cl. 310—22.
Spra-Con Co., The: *See*—
Harrison, Walter G., Gary, and Audet. 3,272,354.
Sprague Electric Co.: *See*—
Peterson, Richard C., and Seacord. 3,273,057.
Sprague, Robert H., J. A. Stewart, and J. M. Lewis, to Horizons Inc. Compositions containing leuco xanthene dyes and suitable activators. 3,272,635, 9–13–66, Cl. 96—90.
Spunize Co. of America, Inc.: *See*—
Rosenstein, Nathan. 3,271,836.
Squibb, E. R., & Sons, Inc.: *See*—
Lerner, Leonard J., and Weisenborn. 3,272,710.
Staesche, Maria: *See*—
Berghaus, Bernhard, and Staesche. 3,272,730.
Stahly, Eldon E., to Sinclair Research, Inc. High energy fuels and methods. 3,272,879, 9–13–66, Cl. 260—668.
Standard Oil Co. (Indiana): *See*—
Elwell, Howard A. 3,272,337.
Standard Pneumatic Motor Co.: *See*—
Bent, John H. 3,272,079.
Standard Tool & Mfg. Co.: *See*—
Solski, Frank A., and Shepard. 3,271,840.
Stanford Research Institute: *See*—
Myers, Robert E. 3,272,670.
Star Coffee Co.: *See*—
Plagenberg, Walter A. 3,272,370.
Stark, John, Jr. B. E. Denton, and J. W. McLeod, Jr., to Radio Corp. of America. Enclosure for high voltage apparatus. 3,273,021, 9–31–66, Cl. 317—100.
Starkpole Carbon Co.: *See*—
Sullivan, James F. 3,272,941.
Starre, Gerrit, to North American Philips Co. Inc. Reciprocating dry shaver with movable shear plate and additional cutting means. 3,271,854, 9–13–66, Cl. 30—34.1.
Stauffer Chemical Co.: *See*—
Szabo, Karoly. 3,272,892.
Staunt, Martin, to American Hospital Supply Corp. Control unit for air driven dental handpieces. 3,272,229, 9–13–66, Cl. 137—544.
Stebbins, Larry O., to Automation Industries, Inc. Apparatus useful in ultrasonic inspection of pipes. 3,272,000, 9–13–66, Cl. 73—71.5.
Stec, Frederick J., to Continental Can Co., Inc. Easy opening container. 3,272,382, 9–13–66, Cl. 220—54.
Stecker, Earl M.: *See*—
Stoelting, Carl R., and Stecker. 3,272,132.
Steer, Robert W., Jr., to Massachusetts Institute of Technology, Phase repeater servo. 3,273,136, 9–13–66, Cl. 340—198.
Stein, Charles H., and W. Krause, to Keuffel & Esser Co. Scribing instruments. 3,271,862, 9–13–66, Cl. 33—18.
Steiner, Russell I.: *See*—
Spatz, Sydney M., and Steiner. 3,272,843.
Steltz, Douglas C.: *See*—
Schneider, Richard C., and Steltz. 3,271,790.
Stephenson, Lee P., and W. W. Klein, to Chevron Research Co. Ergodic signal picking. 3,273,114, 9–13–66, Cl. 340—15.5.
Sterling Drug, Inc.: *See*—
Archer, Sydney, Koelsch, Lorenz, and Tullar. 3,272,804.
Cutler, Royal A., and Schallt. 3,272,814.
Cutler, Royal A., and Schallt. 3,272,863.
Earle, John S., Schoeffel, and Zimmermann. 3,272,739.
Gitchel, Wayne B., Hoffman, and Schoeffel. 3,272,740.
Shupe, Irwin S. 3,272,700.
Stevens, Daryl W., to Clark Equipment Co. Industrial lift truck. 3,272,365, 9–13–66, Cl. 214—671.
Stevens, Roger W., to United States Steel Corp. Stranded wire structures. 3,271,944, 9–13–66, Cl. 57—145.
Stewart, John A.: *See*—
Sprague, Robert H., Stewart, and Lewis. 3,272,635.

Stewart, John K. Infra red remote controller. 3,272,982, 9–13–66, Cl. 246—187.
Stewart, Orald L., to The Cleveland Metal Abrasive Co. Metal shot producing apparatus. 3,271,992, 9–13–66, Cl. 72—476.
Stieber, Ortwin. Infinitely variable speed power transmission, especially ball friction transmission. 3,272,025, 9–13–66, Cl. 74—198.
Stiehl, Roy T., to E. I. du Pont de Nemours and Co. Method of finishing textile fabric prepared from polyester blend yarns, and resulting fabric. 3,272,587, 9–13–66, Cl. 8—115.7.
Stiles, Alvin B., to E. I. du Pont de Nemours and Co. Catalyst composition comprising mangano-chromia-manganite and a chromate. 3,272,759, 9–13–66, Cl. 252—465.
Stiles, Alvin B., to E. I. du Pont de Nemours and Co. Intermittent water vapor addition during formaldehyde synthesis. 3,272,868, 9–13–66, Cl. 260—603.
Stock, Arthur J., to Stock Equipment Co. Under-bunker conveyor. 3,272,314, 9–13–66, Cl. 198—150.
Stock Equipment Co.: *See*—
Stock, Arthur J. 3,272,314.
Stoelting Bros. Co.: *See*—
Stoelting, Carl R., and Stecker. 3,272,132.
Stoelting, Carl R., and E. M. Stecker, to Stoelting Bros. Co. Pump. 3,272,132, 9–13–66, Cl. 103—9.
Stolbach, Henry J. Slicing knife. 3,271,855, 9–13–66, Cl. 30—283.
Stoll, Kurt. Speed regulating valve. 3,272,083, 9–13–66, Cl. 91—405.
Stone, Richard L., and R. J. Bellatorre, to Wallace-Murray Corp. Double-walled vent pipe coupling. 3,272,537, 9–13–66, Cl. 285—187.
Stone, Robert O.: *See*—
Shapiro, Gustave, and Stone. 3,273,160.
Stong, Guy E.: *See*—
Smith, Gail P., and Stong. 3,272,686.
Stover, Harris A., to Collins Radio Co. Means for measuring signal intensity without interrupting the received signal. 3,273,065, 9–13–66, Cl. 325—67.
Stowell, Charles: *See*—
Haytock, Benjamin, III, and Stowell. 3,272,235.
Strang, Urho A.: *See*—
Fournier, Daniel B., and Strang. 3,271,994.
Stransky, Gustave, to MacGregor & Co. (Naval Architects) Ltd. Power operating means for opening and closing hatch covers. 3,272,255, 9–13–66, Cl. 160—188.
Street, Louis F. to Frank W. Egan & Co. Underwater pelletizer. 3,271,821, 9–13–66, Cl. 18—12.
Stripp, Peter W., to Tecalemit (Engineering) Ltd. Fluid filters for internal combustion engines. 3,271,937, 9–13–66, Cl. 55—307.
Strobel, Albert F., and S. C. Catino, to General Aniline & Film Corp. α-cyano-β,β-diphenylacrylamide compounds. 3,272,-810, 9–13–66, Cl. 260—247.1.
Strobel, Albert F., and S. C. Catino, to General Aniline & Film Corp. Bis-α-cyano-β-substituted cinnamic acid amides and esters. 3,272,855, 9–13–66, Cl. 260—465.
Strohm, William G., and E. F. Yhap, to International Business Machines Corp. Queue reducing memory. 3,273,131, 9–13–66, Cl. 340—172.5.
Strohmeier, Walter, J. G. Bernaldo de Quiros, and W. Ullmann, to Agie A.G. fur Industrielle Elektronik. Circuit with controlled rectifiers and improved ignition thereof. 3,273,041, 9–13–66, Cl. 321—4.
Stromberg-Carlson Corp.: *See*—
Tomaszewski, Carlos A. 3,273,009.

Stubbe, Friedrich: *See*—
Breher, Rudolf. 3,271,845.
Stucki, Jakob. Storage rack. 3,272,581, 9–13–66, Cl. 312—234.4.
Stulen, Walter H., to Baldwin-Lima-Hamilton Corp. Extrusion apparatus and method. 3,271,986, 9–13–66, Cl. 72—267.
Sturnich, Angelo. Kinematographic projecting apparatus incorporating a screen. 3,272,584, 9–13–66, Cl. 352—123.
Suehiro, Yoshiyuki, A. Takashima, T. Suzuki, and H. Doi. Method of producing uranium dioxide powder. 3,272,602, 9–13–66, Cl. 23—354.
Sugden, John W. Merchandising display rack. 3,272,344, 9–13–66, Cl. 211—1.
Sukup, Eugene G., to Sukup Mfg. Co. Method and apparatus for aerating stored grain. 3,272,480, 9–13–66, Cl. 259—111.
Sukup Mfg. Co.: *See*—
Sukup, Eugene G. 3,272,480.
Sullivan, James F., to Starkpole Carbon Co. Overload protected electric switch. 3,272,941, 9–13–66, Cl. 200—116.
Sulzer Bros. Ltd.: *See*—
Brunner, Alfred. 3,271,960.
Sun Oil Co.: *See*—
Bennett, John D., and Peret. 3,272,146.
Hansel, William B. 3,272,598.
McNelis, Edward J. 3,272,775.
Peterson, Henry J. 3,272,859.
Polishuk, Arthur T. 3,272,742.
Young, Elnar T. 3,272,217.
Sunbeam Corp.: *See*—
Spohr, Albert R. 3,272,998.
Sunde, Conrad J.: *See*—
Richey, Thomas B., Jr., and Sunde. 3,272,850.
Sunde, Conrad J., and T. B. Richey, Jr., to Malmstrom Chemical Corp. Purification of acylated lanolin products. 3,272,-851, 9–13–66, Cl. 260—428.
Sundstrand Corp.: *See*—
Silvern, David H., and Nichols. 3,271,952.
Durdin, Augustus C., Kittle, Baits, and Swenski. 3,272,-476.
Surckla, Peter P.: *See*—
Pearch, Lovell E., and Surckla. 3,272,440.
Sus, Oskar, H. Rauhut, and H. Schafer, to Keuffel & Esser Co. Photo thermographic diazo material and its method of use for photocopying. 3,272,627, 9–13–66, Cl. 96—49.
Sus, Oskar: *See*—
Rauhut, Herbert, and Sus. 3,272,630.
Sutaruk, Alex, to Eaton Yale & Towne Inc. Viscous fluid clutch having heat dissipation means. 3,272,292, 9–13–66, Cl. 192—58.
Sutherland, John D., Jr., K. Ganslaa, and R. A. Gerlicher, to Copolymer Rubber and Chemical Corp. Method of coagulating rubbery polymer latices. 3,272,768, 9–13–66, Cl. 260—27.
Sutton, Blaine M.: *See*—
Gordon, Maxwell, and Sutton. 3,272,817.
Sutton, Earl E., to Dominion Electric Corp. Device for drying hair and fingernails. 3,272,966, 9–13–66, Cl. 219—370.
Suzuki, Takashi: *See*—
Suehiro, Yoshiyuki, Takashima, Suzuki, and Doi. 3,272,-602.
Suzumura, Hideo, and H. Miyahara, to Kurashiki Rayon Co., Ltd. Water-resistant adhesives. 3,272,675, 9–13–66, Cl. 156—292.
Swain & Myers, Inc.: *See*—
Peacock, Henry S., and Durham. 3,272,157.
Swan, Alfred H., to Reduction Co., Inc. Apparatus for the manufacture of hose by helically winding an elongated strip of plastic material. 3,272,678, 9–13–66, Cl. 156—429.
Swanson, Ralph G., and A. N. Walus, to E. I. du Pont de Nemours and Co. Epoxy terminated polyester complexes, coating compositions containing same and metal substrates coated therewith. 3,272,647, 9–13–66, Cl. 117—75.
Swedlow, Inc.: *See*—
Lampman, James A., Young, and Hardesty. 3,272,672.
Sweeney, Victor D., and W. U. Kaji, to Metal Pumping Services, Inc. Apparatus and process for adding solids to a liquid. 3,272,619, 9–13–66, Cl. 75—65.
Sweet, Ronald L., to E. I. du Pont de Nemours and Co. Polychloroquinacridone pigments. 3,272,822, 9–13–66, Cl. 260—279.
Swift Mfg. Co.: *See*—
South, Elmer D. 3,271,824.
Sylvania Electric Products Inc.: *See*—
Jackson, Donald L. 3,272,978.
Ricker, William C., and Simpson. 3,272,944.
Symes, William F., to Monsanto Co. Potassium dichloro- and trichloro-isocyanurate complexes. 3,272,813, 9–13–66, Cl. 260—248.
Symonds, John, to E. I. du Pont de Nemours and Co. Method of heat treating nickel base alloy articles up to 20 mils in thickness. 3,272,666, 9–13–66, Cl. 148—13.
Syn-Pak Corp.: *See*—
Ogle, Robert W. 3,272,322.
Knox, Lawrence H. 3,272,802.
Szabo, Karoly, to Stauffer Chemical Co. Method of preparing organic phosphonates by transesterification. 3,272,892, 9–13–66, Cl. 260—982.
Szkudlapski, Alfons H., to Western Electric Co., Inc. Etching of silicon and germanium. 3,272,748, 9–13–66, Cl. 252—79.3.
T.M.M. (Research) Ltd.: *See*—
Archer, Anthony H. 3,272,048.
Taber, David, E. E. Renfrew, and H. W. Pons, to American Aniline Products, Inc. Quaternary ammonium salts of amino halohydrin dyestuffs. 3,272,792, 9–13–66, Cl. 260—155.
Taber, David, E. E. Renfrew, and H. W. Pons, to American Aniline Products, Inc. Quaternary ammonium salts of halohydrin ether dyestuffs. 3,272,793, 9–13–66, Cl. 260—156.
Taber, David, E. E. Renfrew, and H. W. Pons, to American Aniline Products, Inc. Isothiuronium salts of amino bromohydrin dyestuffs. 3,272,794, 9–13–66, Cl. 260—157.
Takafuji, Tsuyoshi, to Kabushikikaisha Yokogawa Denki Seisakusho (Yokojawa Electric Works Ltd.). Electrical signal switching device. 3,273,047, 9–13–66, Cl. 321—48.
Takasaki, Rinji: *See*—
Tanabe, Katsumi, Takasaki, Hayashi, Morisawa, Hashimoto, and Okada. 3,272,800.
Takashima, Akio: *See*—
Suehiro, Yoshiyuki, Takashima, Suzuki, and Doi. 3,272,-602.
Tamarin, Bernard J., to Pull Packaging, Inc. Packaging of cigars or the like. 3,272,321, 9–13–66, Cl. 206—41.2.
Tanabe, Katsumi, R. Takasaki, R. Hayashi, Y. Morisawa, T. Hashimoto, and Y. Okada, to Sankyo Co. Ltd. Process for preparing Δ^4-3-ketosteroids. 3,272,800, 9–13–66, Cl. 260—239.55.
Tanner, Robert L., to Control Data Corp. Lens feed system. 3,273,154, 9–13–66, Cl. 343—753.
Tassone, Bruno A., and J. L. Blake, Jr., to Skf Industries, Inc. Seal for bearings. 3,272,574, 9–13–66, Cl. 308—187.2.
Taub, Daniel M.: *See*—
Owen, Charles E., Peacock, and Taub. 3,273,126.

Wheaton, Robert M.: *See*—
Hansen, Robert D., and Wheaton. 3,272,737.
Wheeler, Clarence W. Carbonating and dispensing apparatus. 3,271,974, 9–13–66, Cl. 62—395.
Wheeler, Dean F.: *See*—
McCabe, Ralph P., and Wheeler. 3,271,950.
Whirlpool Corp.: *See*—
Wood, Donald C. 3,272,652.
White, David U., and H. M. Rebeck, to Brown Citrus Machinery Corp. Juice extractor for testing citrus fruit. 3,272,116, 9–13–66, Cl. 100—112.
White, Gerald N., to The Pavelle Corp. Method of producing arylamino acid color couplers. 3,272,858, 9–13–66, Cl. 260—518.
White Kenneth J., to Dennison Mfg. Co. Copying apparatus. 3,272,067, 9–13–66, Cl. 88—24.
Whitehurst, Joe R., to Ideal Industries, Inc. Stop motion for textile fiber drafting machine. 3,271,823, 9–13–66, Cl. 19—.25.
Whitmore, Charles H.: *See*—
Connoy, Eugene N., Hoffman, Parkin, and Whitmore. 3,272,138.
Whitmore, Max E. Dispensing method and apparatus. 3,272,388, 9–13–66, Cl. 222—129.1.
Whitson, Bobbie L., to Phillips Petroleum Co. Accurate flow control. 3,271,993, 9–13–66, Cl. 73—3.
Whittaker Corp.: *See*—
Long, Roger A. 3,271,852.
Wolcott, Charles E. 3,273,067.
Wiener, Murray, to The Babcock & Wilcox Co. Start-up system for forced flow vapor generator. 3,271,961, 9–13–66, Cl. 60—105.
Wieser, Peter F.: *See*—
Crafts, Walter, and Wieser. 3,272,623.
Wigal, Voorhis F.: *See*—
Tigrett, John B., and Wigal. 3,272,604.
Wilburn, Herbert S., Jr. Centrifugal pump. 3,272,134, 9–13–66, Cl. 103—25.
Wild, Anton J. Packer grid. 3,271,928, 9–13–66, Cl. 53—248.
Wilder, Karl T., to ECD Industries. Article sorting system. 3,272,353, 9–13–66, Cl. 214—11.
Wilks, Robert S., to Honeywell Inc. Controlling apparatus. 3,272,078, 9–13–66, Cl. 91—47.
Williams, Carter P., to Kobe, Inc. Pilot operated pressure regulator. 3,272,227, 9–13–66, Cl. 137—491.
Williams, Ebenezer D., Jr., to E. I. du Pont de Nemours & Co. Process for stabilizing bulked yarns and product thereof. 3,271,943, 9–13–66, Cl. 57—140.
Williams, Noble S.: *See*—
Koester, Charles J., and Williams. 3,273,072.
Williams, Nathan P.: *See*—
Betts, Robert E., and Williams. 3,272,127.
Williams Research Corp.: *See*—
Jones, John F., Benson, and Williams. 3,271,949.
Williams, Sam B.: *See*—
Jones, John F., Benson, and Williams. 3,271,949.
Williams, Shafter L. Apparatus for making and wrapping soft-center candy suckers. 3,272,152, 9–13–66, Cl. 107—4.
Williams, Stanley R.: *See*—
Hughes, Francis, and Williams. 3,272,254.
Williams, W. L.: *See*—
Roach, Robert L. 3,272,894.
Wills, Leonard A. Sanitary sipping-straw dispenser having a reciprocating ejector. 3,272,386, 9–13–66, Cl. 221—254.
Wilson, Gilbert: *See*—
Miks, Claude E., Linton, and Wilson. 3,272,014.
Wilson, Richard L., to Westinghouse Air Brake Co. Railway fluid pressure brake apparatus. 3,272,565, 9–13–66, Cl. 303—8.
Wilson, Walter, and H. May, to British Industrial Plastics Ltd. Copolymers of trioxane another aldehyde having at least two carbon atoms and optionally a third comonomer. 3,272,780, 9–13–66, Cl. 260—73.

Wilson, Walter A.: *See*—
Laycak, John F., and Wilson. 3,272,970.
Wilting, Johannes J., to North American Philips Co. Inc. Self-generating inverter with controlled semiconductor rectifiers. 3,273,076, 9–13–66, Cl. 331—113.
Winberg, Ragnar W. Buckle forming stock. 3,271,830, 9–13–66, Cl. 24—163.
Winchester, Raymond E., Jr., to Monsanto Co. Method and apparatus for forming plastic articles. 3,272,896, 9–13–66, Cl. 264—98.
Windmoeller & Hoelscher: *See*—
Brockmuller, Friedrich F. 3,272,093.
Winestock, Bernard J., and J. D. Shnable, to Controls Co. of America. Control circuit. 3,273,037, 9–13–66, Cl. 318—467.
Winterstein, Alexander, to The Norwich Pharmacal Co. 4-(3,4-dimethoxybenzylideneamino) - 6,7 - dimethoxyquinoline. 3,272,806, 9–13–66, Cl. 260—240.
Witt, Chester J., S. P. Skoll, and H. G. Mojonnier, to Mojonnier Bros. Co. Float operated signal device. 3,272,020, 9–13–66, Cl. 74—18.1
Wittrock, Edward. Support bracket for perforated boards. 3,272,468, 9–13–66, Cl. 248—225.
Wix Corp.: *See*—
Humbert, Kingsley E., Jr. 3,272,336.
Wixon, Harold E., to Colgate-Palmolive Co. Detergent liquid. 3,272,753, 9–13–66, Cl. 252—137.
Woltun, Eberhard: *See*—
Ohnacker, Gerhard, and Woltun. 3,272,811.
Wolcott, Charles E., to Whittaker Corp. Hybrid ring multicoupler for a plurality of pair of transmitters. 3,273,067, 9–13–66, Cl. 325—129.
Wolff, Paul A., to Kerr-McGee Oil Industries, Inc. Method of operating a submersible barge for submarine operations. 3,271,964, 9–13–66, Cl. 61—46.5.
Wood, Albert G., W. W. Fenn, T. D. Kegelman, and H. S. Halpern, to United Aircraft Corp. Terrain-viewing system. 3,273,148, 9–13–66, Cl. 343—11.
Wood, Carl O., to Westinghouse Electric Corp. Rotors of centrifugal fans. 3,272,429, 9–13–66, Cl. 230—134.
Wood, Donald C., to Whirlpool Corp. Method of removing film deposits. 3,272,652, 9–13–66, Cl. 134—34.
Wood, George A., Jr.: *See*—
Atkins, John H., and Wood. 3,272,160.
Wood, George C. Mill mixer and spreader with twin compartments. 3,272,515, 9–13–66, Cl. 275—3.
Wooding, Patrick J., to Consarc Corp. Continuous weighing of a consumable electrode. 3,272,905, 9–13–66, Cl. 13—9.
Woodward Governor Co.: *See*—
Parker, George E. 3,272,234.
Woolfenden, Brian K., to Air Products and Chemicals, Inc. Shaft seal assembly. 3,272,520, 9–13–66, Cl. 277—165.
Woolslayer, Homer J., C. Jenkins, and J. R. Woolslayer, to Lee C. Moore Corp. Oil well drilling apparatus with self-raising drawworks support. 3,271,915, 9–13–66, Cl. 52—122.
Woolslayer, Joseph R.: *See*—
Woolslayer, Homer J., Jenkins, and Woolslayer. 3,271,915.
Worley, Gaston K.: *See*—
Worley, Robert I. and G. K. 3,272,925.
Worley, Robert I. and G. K. Coded disk repertory telephone dialer. 3,272,925, 9–13–66, Cl. 179—90.
Worthey, Jimmy D.: *See*—
Easton, Joe A. 3,272,287.
Wrenshall, Edward N., to Miller Printing Machinery Co. Hooded gas distribution valve for underground use. 3,272,224, 9–13–66, Cl. 137—382.
Wright, Barry, Corp.: *See*—
Weber, Milton N. 3,272,021.
Wright, George C.: *See*—
Ebetino, Frank F., and Wright. 3,272,824.
Xerox Corp.: *See*—
Murray, Thomas C., Roberts, and Kaupp. 3,272,101.
Yamada, Shinichi: *See*—
Kigane, Koji, Yamada, and Isozaki. 3,272,676.
Yamada, Toyoo: *See*—
Ito, Jinichi, Shibuya, and Yamada. 3,272,065.
Yamaguchi, Sakuji. Method of coupling high frequency electric circuit. 3,272,955, 9–13–66, Cl. 219—10.53.
Yamamoto, Takashi, to Nippon Oils and Fats Co. Ltd. Antistatic treatment with a quaternary ammonium perhalogenate and products thereof. 3,272,648, 9–13–66, Cl. 117—139.5.
Yamron, Joseph, and A. E. Scoville, to United Aircraft Corp. Random orientation inertia system. 3,272,972, 9–13–66, Cl. 235—150.25.
Yankers, Francis J. Locking slide fastener. 3,271,832, 9–13–66, Cl. 24—205.11.
Yardney International Corp.: *See*—
Lang, Maurice. 3,272,654.
Solomon, Frank, and Himy. 3,272,653.
Yhap, Ernesto F.: *See*—
Strohm, William G., and Yhap. 3,273,131.
Yonts, Oliver C.: *See*—
Veach, Allen M., and Yonts. 3,272,983.
Yosemite Chemical Co.: *See*—
De Lew, Earl R., and Lazar. 3,272,758.
Yoshimitsu, Hideyuki: *See*—
Nakano, Hiroshi, Morimoto, Yoshimitsu, and Kimata. 3,272,832.
Young, Donald C., to Union Oil Co. of California. Weed oil-fertilizer composition. 3,272,613, 9–13–66, Cl. 71—2.3.
Young, Elnar T., to Sun Oil Co. Systems for proportioning fluids. 3,272,217, 9–13–66, Cl. 137—101.19.
Young, Fred W., and R. G. Hummer, to Unarco Industries, Inc. Nestable cart. 3,272,528, 9–13–66, Cl. 280—33.99.
Young, Glenn E.: *See*—
Lampman, James A., Young, and Hardesty. 3,272,672.
Young, Hobert D.: *See*—
Case, Everett N., Patinkin, and Young. 3,272,607.
Young, Robert G., to Sperry Rand Corp. Friction brake. 3,272,288, 9–13–66, Cl. 188—67.
Zack, Andre. Method and device for manufacturing buttons consisting of several elements. 3,273,427, 9–20–66, Cl. 79—5.
Zajic, James E., to Kerr-McGee Oil Industries, Inc. Extraction of metal values using denitrifying microorganisms. 3,272,621, 9–13–66, Cl. 75—101.
Zajic, James E.: *See*—
Goren, Mayer B., Zajic, and Dunlap. 3,272,716.
Zanni, Alexander J. Precision wire severing apparatus. 3,271,904, 9–13–66, Cl. 51—98.
Zannini, Enzo: *See*—
Caputo, Ezio, and Zannini. 3,272,862.
Zarich, Ennio J. Electrical chance device. 3,272,511, 9–13–66, Cl. 273—141.
Zarm, Horst, to North American Philips Co., Inc. Transit latch for phonograph. 3,272,512, 9–13–66, Cl. 274—1.
Zech, Horst: *See*—
Ewald, Gert, Zech, and Esser. 3,271,930.
Zech, John D., and J. W. Le Maistre, to Atlas Chemical Industries, Inc. Bisglycidyl ethers of isohexides. 3,272,845, 9–13–66, Cl. 260—347.8.
Zeiss Ikon Aktiengesellschaft: *See*—
Ploke, Martin. 3,272,103.
Zenczak, Piotr, to Evans Products Co. Method of making a battery separator. 3,272,657, 9–13–66, Cl. 136—148.
Zenith Radio Corp.: *See*—
De Vries, Adrian J., Morris, and Roschke. 3,272,906.
Zenk, Robert R., to Gisholt Corp. Spring loaded bearing arrangement. 3,272,570, 9–13–66, Cl. 308—6.
Zettlemoyer, Albert C., J. J. Chessick, and N. Tcheurekdjian. Nucleating process. 3,272,434, 9–13–66, Cl. 239—2.
Zeyen, Fritz-Otto: *See*—
Koll, Roman, and Zeyen. 3,272,918.
Ziegler, George F., to Bausch & Lomb Inc. Microscope objective having two doublets. 3,272,071, 9–13–66, Cl. 88—57.
Ziegler, George F., to Bausch & Lomb Inc. Three member microscope objective. 3,272,072, 9–13–66, Cl. 88—57.
Zimmermann, Frederick J.: *See*—
Earle, John S., Schoeffel, and Zimmermann. 3,272,739.
Zoretic, Max A. Device for launching, landing and portaging a boat. 3,271,798, 9–13–66, Cl. 9—1.
Zukin, Arthur S., to Hughes Aircraft Co. Conversion systems. 3,273,142, 9–13–66, Cl. 340—347.

CLASSIFICATION OF PATENTS

ISSUED SEPTEMBER 13, 1966

NOTE.—First number, class; second number, subclass; third number, patent number

2– 12	:	3,271,778
98	:	3,271,779
146	:	3,271,780
202	:	3,271,781
236	:	3,271,782
		3,271,783
4–134	:	3,271,784
		3,271,785
160	:	3,271,786
172	:	3,271,787
		3,271,788
		3,271,789
180	:	3,271,790
185	:	3,271,791
247	:	3,271,792
252	:	3,271,793
		3,271,794
5– 63	:	3,271,795
82	:	3,271,796
348	:	3,271,797
8– 10	:	3,272,585
26	:	3,272,586
115.7	:	3,272,587
9– 1	:	3,271,798
12– 12	:	3,271,799
12.5	:	3,271,800
13– 9	:	3,272,905
14– 71	:	3,271,801
15– 21	:	3,271,802
		3,271,803
119	:	3,271,804
176	:	3,271,805
		3,271,806
223	:	3,271,807
256.5	:	3,271,808
526	:	3,271,809
539	:	3,271,810
16–140	:	3,271,811
197	:	3,271,812
17– 1	:	3,271,813
7	:	3,271,814
12	:	3,271,815
18– 4	:	3,271,816
8	:	3,271,817
		3,271,818
12	:	3,271,819
		3,271,820
		3,271,821
		3,271,822
19– .22:		3,271,824
.25:		3,271,823
65	:	3,271,825
159	:	3,271,826
21– 2.7	:	3,272,588
98	:	3,272,589
22– 85	:	3,271,827
200	:	3,271,828
23– 22	:	3,272,590
50	:	3,272,591
88	:	3,272,592
89	:	3,272,593
110	:	3,272,594
200	:	3,272,595
259.1	:	3,272,596
277	:	3,272,597
284	:	3,272,598
290.5	:	3,272,599
344	:	3,272,600
349	:	3,272,601
354	:	3,272,602
24–153	:	3,271,829
163	:	3,271,830
200	:	3,271,831
205.11:		3,271,832
230	:	3,271,833
25– 7	:	3,271,934
26– 15	:	3,271,835
28– 72	:	3,271,836
74	:	3,271,837
29– 2.16:		3,271,838
33	:	3,271,839
		3,271,840
95.1	:	3,271,841
96	:	3,271,842
155.5	:	3,271,843
155.63:		3,271,844
157.1	:	3,271,845
157.3	:	3,271,846
191	:	3,272,603
229	:	3,271,847
29–407	:	3,271,848
420.5	:	3,271,849
460	:	3,271,850
492	:	3,271,851
494	:	3,271,852
568	:	3,271,853
30– 34.1	:	3,271,854
41.6	:	3,271,857
283	:	3,271,855
343	:	3,271,856
32– 5	:	3,271,858
22	:	3,271,859
		3,271,860
33– 3	:	3,271,861
18	:	3,271,862
46	:	3,271,863
56	:	3,271,864
74	:	3,271,865
75	:	3,271,866
94	:	3,271,867
143	:	3,271,868
151	:	3,271,869
174	:	3,271,870
		3,271,871
199	:	3,271,872
34– 5	:	3,271,873
		3,271,874
		3,271,875
45	:	3,271,876
		3,271,877
		3,271,878
35– 17	:	3,271,879
		3,271,880
19	:	3,271,881
31	:	3,271,882
35	:	3,271,883
		3,271,884
36– 2.5	:	3,271,885
7.2	:	3,271,886
14	:	3,271,887
72	:	3,271,888
38–143	:	3,271,889
43– 4	:	3,271,890
15	:	3,271,891
42.03:		3,271,892
43.14:		3,271,893
65	:	3,271,894
44– 42	:	3,272,604
51	:	3,272,605
69	:	3,272,606
70	:	3,272,607
46– 31	:	3,271,895
87	:	3,271,896
92	:	3,271,897
118	:	3,271,898
210	:	3,271,899
47– 38.1	:	3,271,900
49– 17	:	3,271,901
483	:	3,271,902
51– 8	:	3,271,903
98	:	3,271,904
101	:	3,271,905
102	:	3,271,906
141	:	3,271,907
165	:	3,271,908
		3,271,909
		3,271,910
206	:	3,271,911
216	:	3,271,912
52– 16	:	3,271,913
36	:	3,271,914

U.S. DEPARTMENT OF COMMERCE

OFFICIAL GAZETTE of the UNITED STATES PATENT OFFICE

September 13, 1966 Volume 830 Number 2

TRADEMARKS

NOTICES

United States Adopted Names

List No. 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
descinolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the

CONDITION OF TRADEMARK APPLICATIONS AS OF JULY 31, 1966

Total number of applications awaiting action [excluding renewals and Sec. 12(c)]	28,840
Date of oldest new application	July 15, 1965
Date of oldest amended application (filing date)	July 6, 1962

C. M. WENDT, Director, Trademark Examining Operation

TRADEMARK EXAMINING DIVISIONS, EXAMINERS AND TRADEMARK CLASSES UNDER EXAMINATION	Oldest Application: New	Oldest Application: Amended
(I) L. J. BETTENDORF (Acting), Classes 2, 4, 5, 8, 11, 12, 13, 14, 15, 16, 17, 19, 20, 21, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 39, 41, 42, 43, 44	7-15-65	2-24-64
(II) F. H. WETHERBEE (Acting), Classes 1, 3, 6, 7, 9, 10, 18, 22, 38, 40, 45, 46, 47, 48, 49, 50, 51, 52; Service Marks, Classes 100, 101, 102, 103, 104, 105, 106, 107; Collective Membership Marks, Class 200; Certification Marks, Classes A and B	9-25-65	7-6-62

Registrations Issued—498—No. 814,753 to No. 815,250
Renewals Issued—70

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402 to whom all subscriptions should be made payable and all communications addressed; subscription price, $12.00 per annum, foreign mailing $4.00 additional; single copies, 25 cents each.

PRINTED COPIES OF TRADEMARK REGISTRATIONS are furnished by the Patent Office for 20 cents each. Address orders to the Commissioner of Patents, Washington, D.C., 20231.

period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name;* all other names on the list are *proposed for adoption.*

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldezone: antibacterial
*nitarsone: veterinary histomonastat
*nitrazepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic
*prednival: topical anti-inflammatory
*prilocaine hydrochloride: local anesthetic
*propiram fumarate: analgesic
*pyrantel tartrate: anthelmintic
quilaxine maleate: oxytocic
*rifamide: antibacterial
*roxarsone: veterinary growth simulant
seperidol hydrochloride: neuroleptic
*sodium ampicillin: antibiotic
*sodium edetate: chelating agent
*sodium ethacrynate: diuretic
sulfabenz: veterinary antibacterial and anticoccidial
sulfafen: antibacterial; anticoccidial agent
*tetramisole hydrochloride: anthelmintic
*tetroquinone: treatment of keloids
thyroglobulin: thyroid preparation
*trimoxamine hydrochloride: antihypertensive
*trisodium edetate: chelating agent
*viridofulvin: antifungal antibiotic
zolertine hydrochloride: vasodilator; anti-adrenergic; antihypertensive

Trademark Suits

Notices under 15 U.S.C. 1116; Trademark Act of July 5, 1946

Reg. No. 167,769 (AMOCO), The American Oil Company, Gasoline, motor fuels, and lubricating oils; **Reg. No. 335,766,** same, Naphtha; **Reg. No. 657,012,** same, Gasoline, motor fuel, naphtha, lubricating oil and grease, flushing oil, and heating oil; **Reg. No. 704,187,** same, Additives for lubricating oils and greases; **Reg. No. 722,940,** same, Plasticizers to impart flexibility or elasticity to plastics, resins, rubber elastomers, etc.; **Reg. No. 730,612,** same, Synthetic resins for general use in the industrial arts; **Reg. No. 736,984,** same, Agricultural chemicals to control the growth of weeds and noxious plants and promote the growth of agricultural products, herbicides and insecticides, **filed** Apr. 15, 1966, D.C., S.D. Calif. (Los Angeles), Doc. 66–644–PH, *The American Oil Company* v. *Ogden B. Armour et al.* Final consent judgment in favor of plaintiff; defendants enjoined June 13, 1966.

Reg. No. 335,766. (See Reg. No. 167,769.)

Reg. No. 425,005 (SLITTERS'), Michael J. Schlitters, doing business as Screw Machine Tool Company, Screw machine and turret lathe tool holders and parts—namely, cut-off slides, form slides, form tool holders, etc., **filed** July 12, 1966, D.C., E.D. Mich. (Detroit), Doc. 28664, *Screw Machine Tool Company* v. *Slater Tool and Engineering Corporation et al.*

Reg. No. 426,781 (AEROJET), Aerojet Engineering Corporation, Thrust motors whose general purpose is to provide thrust by means of a combustion process, and includes all the component parts of such motors; **Reg. No. 633,546** (AEROJET-GENERAL), Aerojet-General Corporation, Rockets, rocket motors, and jet assist take-off units; **Reg. No. 633,548** (AEROJET), same, Internal combustion engines, marine engines, components thereof, and components associated therewith; **Reg. No. 746,156** (AEROJET-GENERAL), same, Aircraft and component parts thereof, **filed** Nov. 15, 1965, D.C., S.D. Calif. (Los Angeles), Doc. 65–1640–IH, *Aerojet-General Corp.* v. *Marquette Corporation.* Order of dismissal without prejudice Mar. 18, 1966.

Reg. No. 514,366 (NAKEN'S TARNISH PROOF SILVERWARE CHEST AND DESIGN), M. I. Naken Co., Chests for receiving and storing table flatware, **filed** July 19, 1966, D.C., S.D. Calif. (Los Angeles), Doc. 66–1180–PH, *M. I. Naken Co.* v. *William Naken.*

Reg. No. 575,391 (THE RED BOOK), The Reuben H. Donnelley Corporation, Classified telephone directories; **Reg. No. 588,850** (RED BOOK BUYERS' SERVICE), same, Providing buying information as to sellers of all kinds of merchandise and services and who advertise in the telephone directories known as "The Red Book," **filed** Jan. 27, 1966, D.C., S.D.N.Y., Doc. 66/266, *The Reuben H. Donnelley Corp.* v. *Directory Advertising Counselors, Inc. et al.* Consent judgment—defendants enjoined July 7, 1966.

Reg. No. 588,850. (See Reg. No. 575,391.)

Reg. No. 593,368 (AQUA NET in script), Rayette, Inc., Water soluble freon dispensed hair dressing, **filed** July 14, 1966, D.C., S.D.N.Y., Doc. 66/2133, *Rayette-Faberge, Inc.* v. *Riverton Laboratories, Inc.*

Reg. No. 602,098 (OTOSONE), Broemmel Pharmaceuticals, Sterile solution containing cortisone for topical use only—namely, as an ear drop and for skin infections and irritations, **filed** July 12, 1966, D.C., N.D. Calif. (San Francisco), Doc. 45405, *Broemmel Pharmaceuticals* v. *Evsco Pharmaceutical Co. et al.*

Reg. No. 627,996 (UNITED AIR LINES AND DESIGN), United Air Lines, Inc., Transportation of persons, mail, and property by air; **Reg. No. 676,462** (UNITED), same, **filed** July 12, 1966, D.C., S.D.N.Y., Doc. 66/2066, *United Air Lines, Inc. et ano.* v. *Dan Brechner & Co., Inc.*

Reg. No. 633,546. (See Reg. No. 426,781.)

Reg. No. 633,548. (See Reg. No. 426,781.)

Reg. No. 657,012. (See Reg. No. 167,769.)

Reg. No. 676,462. (See Reg. No. 627,996.)

Reg. No. 704,187. (See Reg. No. 167,769.)

Reg. No. 722,940. (See Reg. No. 167,769.)

Reg. No. 730,612. (See Reg. No. 167,769.)

MARKS PUBLISHED FOR OPPOSITION

SECTION 1

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Application for the registration of these marks in more than one class has been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of this publication. See Rules 2.101 to 2.105.

A separate fee of twenty-five dollars for each class opposed must accompany the opposition.

[NOTE: For publication of marks presented in applications for registration in one class, see section 2.]

SN 200,217. Weyerhaeuser Company, Tacoma, Wash. Filed Aug. 19, 1964.

SILVAPLEX

Class 2—Receptacles

For Molded Wood Trays.

Class 12—Construction Materials

For Doors.

Class 32—Furniture and Upholstery

For Counter Tops, Table Parts, and Phonograph Cabinets.

First use Mar. 13, 1964.

SN 200,903. Bond Street Ltd., New York, N.Y. Filed Aug. 31, 1964.

The mark consists of a bud-shaped ornamental tab of metallic composition.

Class 3—Baggage, Animal Equipments, Portfolios, and Pocketbooks

For Handbags, Purses, Wallets, Cosmetic Purses, Passport Cases, Key Cases, and Eyeglass Cases.

Class 8—Smokers' Articles, Not Including Tobacco Products

For Cigarette Cases.

First use at least as early as 1948.

SN 202,611. Morton Manufacturing Company, Chicago, Ill. Filed Sept. 24, 1964.

MODU-LINE

Class 12—Construction Materials

For Construction Walls With Base Assemblies.

Class 32—Furniture and Upholstery

For Display and Partitioning Systems Including Gondolas, Drawer Stack-On Units, Promotional Ends, Display Walls With Base Assemblies, and Box Base Series.

First use July 6, 1964.

SN 213,510. Alken-Murray Corporation, New York, N.Y. Filed Mar. 8, 1965.

Class 6—Chemicals and Chemical Compositions

For Boiler Compounds, Rust and Corrosion Inhibitors.

Class 15—Oils and Greases

For Fuel Oil Additives.

Class 52—Detergents and Soaps

For Sludge, Rust, Scale and Corrosion Cleaning and Removing Preparations.

First use June 15, 1964.

SN 232,046. Morton International, Inc., Chicago, Ill. Filed Nov. 3, 1965.

ADCOTE

Owner of Reg. Nos. 749,280, 795,832, and 796,595.

Class 5—Adhesives

For Adhesives for Industrial Use—Namely, Primers, Extrusion Primers, Heat Seal Adhesives, and Joining or Laminating Adhesives All for Use With Paper, Films, and Foils; Adhesives reactivated by Solvents, Water or Heat and Pressure Sensitive Adhesives.

First use June 9, 1959.

Class 6—Chemicals and Chemical Compositions

For Chemicals for Industrial Use—Namely, Organosols and Plastisols.

First use June 25, 1959.

Class 16—Protective and Decorative Coatings

For Protective and Decorative Coatings for Industrial Use—Namely, Lacquers, Primers and Paints, Both Organic Solvent Base and Water Base; Underprint and Overprint Coatings, Gloss Coatings, Heat Resistant Gloss Coatings, Heat Seal Moisture and Vapor Resistant Coatings, All for Use With Paper, Films and Foils; Paper Plate Coatings, Slip Coatings; Functional and Barrier Coatings for Metal, Plastic Films, Plastics, Cloth, Paper, Wood, and Foamed Plastics.

First use July 31, 1959.

SN 232,969. Morrie Chaitlen, d.b.a. C. & E. Marshall Co., Chicago, Ill. Filed Nov. 19, 1965.

MOSELEY

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Watchmakers' Tools, Machines and Supplies Including Balance Screw Holders, Gravers, Crystal Grinders, Lathes, Lathe Chucks, Pivot Polishers, Adjustable Roller Removers, Sleeve Wrenches, Staking Tools, and Screw Driver Sharpeners.

Class 26—Measuring and Scientific Appliances

For Main Spring Gauges.

Class 37—Paper and Stationery

For Watch Record Books.

First use as early as 1915.

SN 237,637. Woodford Manufacturing Co., Des Moines, Iowa. Filed Feb. 1, 1966.

WOODFORD

Class 13—Hardware and Plumbing and Steam-Fitting Supplies

For Water Hydrants.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

For Dock Plates.

First use Nov. 29, 1962; 1929 as to "Woodford."

SN 240,491. Hedwin Corporation, New York, N.Y. Filed Mar. 9, 1966.

Talk O' the Table

Owner of Reg. No. 803,200.

Class 2—Receptacles

For Coasters, Trays, Napkin Rings, and Lazy Susans.
First use Apr. 19, 1965.

Class 50—Merchandise Not Otherwise Classified

For Table Placemats and Doilies.
First use Sept. 23, 1964.

SECTION 2

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Opposition under section 13 may be filed within thirty days of publication. See Rules 2.101 to 2.105.

A fee of twenty-five dollars must accompany the opposition.

[NOTE: For publication of marks presented in a combined application for registration in more than one class, see section 1.]

Class 3—Baggage, Animal Equipments, Portfolios, and Pocketbooks

SN 235,716. Reliable Luggage, Inc., West Pittsburg, Pa. Filed Jan. 3, 1966.

Shu-Pak

Owner of Reg. No. 656,237.

For Flexible Elastic Shoe Retainers Disposed in the Lids or Covers of Traveling Bags and Suitcases.

First use June 20, 1955.

Class 4—Abrasives and Polishing Materials

SN 224,515. The Cleanola Company, Glenshaw, Pa. Filed July 29, 1965.

CLEANOLA

For Preparations for Cleaning and Polishing Wood, Glass, Metal, and Other Surfaces.

First use Jan. 24, 1900.

Class 5—Adhesives

SN 220,919. The Delta Company, Wheeling, Ill. Filed June 11, 1965.

3D

For Spray-On Solvent Based Adhesives.
First use Apr. 12, 1965.

Class 6—Chemicals and Chemical Compositions

SN 204,477. Johnson Nurseries (Kingston) Limited, Kingston, Ontario, Canada. Filed Oct. 21, 1964.

SCENT-OFF

Priority claimed under Sec. 44(d) on Canadian application filed Apr. 24, 1964; Reg. No. 143,537, dated Jan. 21, 1966.

For Evaporative Dog and Cat Repellent—Namely Wax Impregnated With Repellent Odoriferous Chemicals, Coated on Elongated Flexible Wire-Like Twist-Ties, Sticks, and Spatulas and in the Form of Rigid Pencils, Crayons, and Push-Up Dispensers.

SN 212,809. Private Brands, Inc., Kansas City, Mo. Filed Feb. 25, 1965.

STOPIT

For Herbicide.
First use Feb. 15, 1965.

SN 214,856. FMC Corporation, New York, N.Y. Filed Mar. 24, 1965.

DURAPHOS

For Phosphates for Use in Preventing Scale, Corrosion and "Red" Water in the Treatment of Water Systems.
First use Feb. 11, 1965.

SN 230,908. The Sherwin-Williams Company, Cleveland, Ohio. Filed Oct. 21, 1965.

PERMACHLOR

For Pigments.
First use Oct. 28, 1955.

SN 231,774. Sandoz, Inc., Hanover, N.J. Filed Oct. 28, 1965.

S

Owner of Reg. Nos. 300,570, 315,685, and 796,648.

For Fiber, Textile, Paper, Leather, Plastic, and Paint Processing Chemicals; Dishwashing, Laundering, and Cosmetic Additives and Dyestuffs.

First use 1890.

SN 233,771. Baxter Laboratories, Inc., Morton Grove, Ill. Filed Dec. 2, 1965.

SWAN COTE

Applicant disclaims the exclusive use of the word "Cote" apart from the mark as shown.

For Stain, Soil, and Water Repellent for Fabrics.
First use Sept. 28, 1962.

SN 236,021. Standard Oil Company of California, San Francisco, Calif. Filed Jan. 7, 1966.

CHEVRON

For Chemical Ingredients Used in the Manufacture of Synthetic Detergents.
First use July 1, 1965.

SN 236,364. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GESABAL

Owner of Reg. Nos. 719,834, 736,644, and others.

For Chemical Ingredient Used in the Manufacture of Herbicides.

First use Dec. 21, 1965.

SN 236,365. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GARDOTOP

Owner of Reg. No. 719,834.

For Chemical Ingredient Used in the Manufacture of Herbicides.

First use Dec. 23, 1965.

SN 236,366. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

ANOFEX

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Dec. 21, 1965.

SN 236,367. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

AROPENE

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,368. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GESATAMIN

Owner of Reg. Nos. 406,217, 780,822, and others.

For Chemical Ingredient Used in the Manufacture of Herbicides.

First use Dec. 21, 1965.

SN 236,369. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

STENTAN

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 23, 1965.

SN 236,370. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GESADOM

Owner of Reg. Nos. 406,217, 780,823, and others.

For Chemical Ingredient Used in the Manufacture of Insecticides.

First use Dec. 21, 1965.

SN 236,371. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GENALON

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,373. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

CARDOPRIM

Owner of Reg. Nos. 720,195 and 790,904.

For Chemical Ingredient Used in the Manufacture of Herbicides.

First use Dec. 23, 1965.

SN 236,374. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

CAMPAGARD

Owner of Reg. Nos. 688,968, 727,860, and 790,906.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,375. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

CAMPAPRIM

Owner of Reg. Nos. 790,904, 790,906, and others.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,376. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

MURAL

For Chemical Ingredient Used in the Manufacture of Insecticides.
First use Dec. 21, 1965.

SN 236,377. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

SALITAL

For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 23, 1965.

SN 236,378. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

MILOGARD

Owner of Reg. No. 727,860.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,379. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

GESAFRAM

Owner of Reg. Nos. 406,217, 780,822, and others.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,380. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

TOPAZOL

Owner of Reg. No. 790,904.
For Chemical Ingredient Used in the Manufacture of Herbicides.
First use Dec. 21, 1965.

SN 236,725. The Euclid Chemical Company, Cleveland, Ohio. Filed Jan. 18, 1966.

SURFHARD

For Concrete Floor Hardening and Dustproofing Composition, Consisting of a Magnesium-Zinc Silicofluoride Solution Combined With Oxalin.
First use on or about Feb. 1, 1955.

SN 236,730. The Euclid Chemical Company, Cleveland, Ohio. Filed Jan. 18, 1966.

EUCON WR

For Water Reducing Additive for Concrete Mixes, Comprising a Sodium Lignin Sulfonate Formulation.
First use on or about Mar. 1, 1955.

SN 236,750. Hess Oil & Chemical Corporation, Perth Amboy, N.J. Filed Jan. 18, 1966.

HEXSOL

For Solvents for Use in Industry, Science, Agriculture, and Horticulture.
First use Apr. 1, 1946.

SN 236,751. Hess Oil & Chemical Corporation, Perth Amboy, N.J. Filed Jan. 18, 1966.

AGSOL

For Solvents for Use in Industry, Science, Agriculture, and Horticulture.
First use Oct. 1, 1963.

SN 236,756. Hess Oil & Chemical Corporation, Perth Amboy, N.Y. Filed Jan. 18, 1966.

LACASOL

For Diluent for Use in Industry, Science, Agriculture, and Horticulture.
First use Apr. 1, 1946.

SN 237,196. Biological Research, Inc., Bridgeton, Mo. Filed Jan. 25, 1966.

FORMAFIX

For Tissue Penetrating Fixative for Preservation of Biological and Surgical Specimens, and Other Tissues.
First use Aug. 31, 1965.

SN 237,197. Biological Research, Inc., Bridgeton, Mo. Filed Jan. 25, 1966.

TISSUEFIX

For Tissue Penetrating Fixative for Preservation of Biological and Surgical Specimens, and Other Tissues.
First use Aug. 31, 1965.

SN 238,325. Zevel Corporation, La Mirada, Calif. Filed Feb. 7, 1966.

KN-48

For Chemical Toilet and Holding Tank Deodorant.
First use on or about Jan. 15, 1964.

SN 238,839. Corn Products Company, New York, N.Y. Filed Feb. 15, 1966.

TANZOSE

For Corn Molasses, Corn Hydrol, and Other Preparations for Use in the Tanning and Leather Industries and for Manufacturing Purposes.
First use at least as early as Dec. 29, 1964.

Class 7—Cordage

SN 237,363. Mantaline Corporation, Mantua, Ohio. Filed Jan. 26, 1966.

MANTA-LINE

For Tie-Down Lines Formed of Synthetic Rope and Connectors Therefor, Including Plastic Hooks, Plastic Eyes, and Metal Hooks.
First use June 29, 1964.

Class 8—Smokers' Articles, Not Including Tobacco Products

SN 228,962. Adolf Waldmann, Pforzhei, Germany. Filed Sept. 29, 1965.

USUS

The English translation of the word "Usus" is "custom." Owner of German Reg. No. 783,499, dated Feb. 2, 1963.
For Cigar and Cigarette Holders Made of Metal and Synthetic Plastic, and Cigar and Cigarette Cases Made of Metal.

Class 10—Fertilizers

SN 236,381. Geigy Chemical Corporation, Ardsley, N.Y. Filed Jan. 13, 1966.

BINUTRIN

For Fertilizer.
First use Dec. 21, 1965.

SN 236,887. Glenn J. Elliott, d.b.a. Clarel Laboratory, McHenry, Ill. Filed Jan. 20, 1966.

NU-BUD

For Plant Fertilizer.
First use Mar. 25, 1958.

Class 11—Inks and Inking Materials

SN 228,848. Sun Chemical Corporation, New York, N.Y. Filed Sept. 28, 1965.

HYDROJET

Owner of Reg. No. 765,327.
For Printing Inks.
First use Aug. 30, 1965.

SN 235,187. J. M. Huber Corporation, Borger, Tex. Filed Dec. 23, 1965.

HUBERFLEX

For Printing Inks.
First use June 3, 1965.

SN 235,785. A. P. Little, Inc., Rochester, N.Y. Filed Jan. 4, 1966.

EXECUTIVE

Owner of Reg. No. 254,133.
For Typewriter Ribbons, Carbon Paper, and Infra-Red Copy Paper.
First use July 31, 1928.

SN 236,902. A. P. Little, Inc., Rochester, N.Y. Filed Jan. 19, 1966.

SILON

For Ribbons for Typewriters and for Data Processing Machines.
First use April 1963.

Class 12—Construction Materials

SN 210,271. Chemically Prestressed Concrete Corporation, Van Nuys, Calif. Filed Jan. 21, 1965.

CHEMSTRESS

For Construction Materials—Namely, a Portland Type of Cement Which Produces Expansive Concrete.
First use Jan. 5, 1965.

SN 226,275. The O'Malley Lumber Company, Phoenix, Ariz. Filed Aug. 23, 1965.

For Prefabricated Roof Trusses.
First use Aug. 2, 1965.

SN 226,661. Howmet Corporation, New York, N.Y., by change of name from Howe Sound Company, Dallas, Tex. Filed Aug. 27, 1965.

DECOR-WALL

For Panels for Use as Facing of Commercial and Industrial Buildings.
First use Apr. 28, 1965.

SN 227,955. Pittsburgh Plate Glass Company, Pittsburgh, Pa. Filed Sept. 16, 1965.

Spandreline

Owner of Reg. No. 613,161.
For Structural Glass Panels.
First use at least as early as May 26, 1965.

SN 228,145. Florida Tile Industries, Inc., Lakeland, Fla. Filed Sept. 20, 1965.

florida tile

No exclusive claim is made to the word "Tile" apart from the mark as shown. Owner of Reg. No. 685,378.
For Ceramic Tiles.
First use Mar. 1, 1960.

SN 231,938. Readco Industries Inc., Reading, Mass. Filed Nov. 1, 1965.

Glaze-cote

For Polyurethane Component for Making Seamless Flooring Which Is Incorporated Into the Seamless Flooring During In-Situ Fabrication Thereof.
First use June 1965.

SN 231,940. Readco Industries Inc., Reading, Mass. Filed Nov. 1, 1965.

READCO

For Materials Used for Making Seamless Flooring and Counters—Namely, Polyurethane Coatings, Thinners, Catalysts, Liquid Pigments, Color-Retaining Liquids, and Multicomposition Elastomeric Plastic Floor Underlayments.
First use June 1965.

SN 234,859. Swedlow Inc., Garden Grove, Calif. Filed Nov. 26, 1965.

SWEDCAST 300

Owner of Reg. No. 705,423.
For Cast Acrylic Sheets.
First use Aug. 16, 1965.

SN 234,940. Shur-Line Manufacturing Co., Inc., Lancaster, N.Y. Filed Dec. 20, 1965.

SHUR-WEDGE

Owner of Reg. No. 659,814.
For Wedges Adapted To Be Driven Between Clapboards To Vent Moisture and Reduce Paint Peeling.
First use on or about May 19, 1961.

SN 234,975. United States Steel Corporation (Delaware corporation), Pittsburgh, Pa., by merger and change of name from United States Steel Corporation (New Jersey corporation), Pittsburgh, Pa. Filed Dec. 20, 1965.

AIR-DEK

For Steel Mats for Forming Aircraft Landing Strip.
First use Feb. 19, 1965.

SN 235,186. Holmes Company, Inc., Lakeland, Fla. Filed Dec. 23, 1965.

Insultherm

For Blended Glass Fiber Insulating Material.
First use Oct. 1, 1964.

SN 237,215. General Refractories Company, Philadelphia, Pa. Filed Jan. 25, 1966.

PERAMAX

For Refractory Brick.
First use Mar. 5, 1965.

SN 237,332. General Refractories Company, Philadelphia, Pa. Filed Jan. 26, 1966.

FLEXLOK

Owner of Reg. No. 788,380.
For Refractory Tile.
First use March 1934.

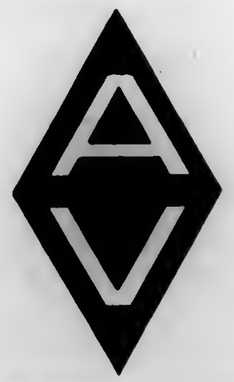
SN 237,334. General Refractories Company, Philadelphia, Pa. Filed Jan. 26, 1966.

RIDGE

For Refractory Brick.
First 1878.

Class 13—Hardware and Plumbing and Steam-Fitting Supplies

SN 233,151. United-Carr Incorporated, Boston, Mass. Filed Nov. 22, 1965.



For Fasteners, Connectors, and Attaching Devices of Various Types Used in Household Construction and Industrial Arts for Mounting and Connecting Various Parts, Whether of Plastic, Wood, Metal, Fabric or Fiberboard—Namely, Separable Snap Fasteners and Component Parts Thereof, Screw Thread Fasteners and Component Parts Thereof, Rotary Stud Fasteners, Molding Fasteners and Component Parts Thereof, Rivets, Threaded Nuts, Tubing, and Wiring Fasteners and Component Parts Thereof; Yieldable Studs, Plug Buttons, Furniture Glides and Component Parts Thereof, Quick Attachable and Detachable Fasteners and Component Parts Thereof, Tape End and Swing Clips and Component Parts Thereof, Grommets, Metallic Washers, Retaining Fasteners for Construction Panels and Retaining Fasteners for Tubing and Wiring.
First use Aug. 10, 1964.

SN 234,856. United States Steel Corporation (Delaware corporation), Pittsburgh, Pa., by merger and change of name from United States Steel Corporation (New Jersey corporation), Pittsburgh, Pa. Filed Dec. 17, 1965.

The drawing is lined for red.
For Steel Tubular Products.
First use Dec. 1, 1965.

SN 235,143. Albert Voigt Industries, Inc., Hicksville, N.Y. Filed Dec. 22, 1965.

For Metal Mounting Members for Furniture Wall Systems; Wood, Glass, and Plastic Shelves, and Cabinet Units and Case Goods Associated With Such Metal Members.
First use September 1959.

SN 235,305. Hydrotherm, Inc., Northvale, N.J. Filed Dec. 27, 1965.

HYDROTHERM

For Devices for Separating Air From Water.
First use January 1946.

SN 237,536. Charter Resign and Manufacturing Corporation, Minneapolis, Minn. Filed Jan. 28, 1966.

CHARTER MATIC

For Coffee Making Apparatus.
First use June 2, 1964.

SN 247,243. Molded Specialties, Inc., Cleveland, Ohio. Filed June 3, 1966.

TRI-CON

For Hose Nozzles.
First use first half of 1934.

Class 16—Protective and Decorative Coatings

SN 228,606. Philip W. Bailey, Seattle, Wash. Filed Sept. 27, 1965.

OLYMPIC

Owner of Reg. Nos. 426,174 and 548,666.
For Wood Stains.
First use Apr. 1, 1938.

SN 228,678. Griffiths Bros. & Co., London, Limited, Wednesfield, Wolverhampton, England. Filed Sept. 27, 1965.

FERRODOR

Owner of British Reg. No. 222,325, dated Apr. 19, 1899.
For Anti-Corrosive Paints for Metal.

SN 230,963. Turco Paint & Varnish Co., Inc., Philadelphia, Pa. Filed Oct. 21, 1965.

COLOUR CUPBOARD

For Oil or Water Base Semi-Gloss, Low Sheen, All-Purpose Indoor and Outdoor Paints.
First use Aug. 18, 1965.

SN 231,076. Electro-Coatings, Inc., Oakland, Calif. Filed Oct. 22, 1965.

NYE-KOTE

For Electroless Metallic Alloy Sold for Use as and in the Form of a Coating.
First use Nov. 3, 1964.

SN 231,941. Readco Industries Inc., Reading, Mass. Filed Nov. 1, 1965.

For Coating Materials Used in In Situ Fabrication of Plastic Surfaces, Principally Floors and Counters—Namely, Polyurethane Coatings, Thinners, Catalysts, Liquid Pigments, Color Retaining Liquids, and Multicomposition Elastomeric Plastic Floor Underlayments.
First use June 1965.

SN 233,387. Poraflor, Inc., Woodside, N.Y. Filed Nov. 26, 1965.

PORAFLOR

For Seamless Polymeric Resin Coatings Applied by Pouring, Troweling or Spraying Over Existing Floorings.
First use May 1964.

SN 235,449. American Lacquer Solvents Co., Phoenixville, Pa. Filed Dec. 28, 1965.

AMER-FLINT

For Catalyzed Synthetic Resin Base Enamel.
First use Dec. 9, 1962.

SN 239,395. T. C. Esser Company, Milwaukee, Wis. Filed Feb. 23, 1966.

POLY-LUSTRE

For Acrylic Latex Finishes for Use on Walls and Woodwork.
First use Jan. 3, 1966.

Class 17—Tobacco Products

SN 228,355. Wally Frank, Ltd., New York, N.Y. Filed Sept. 22, 1965.

JOBEY

For Tobacco Products—Namely, Pipe Tobacco.
First use Aug. 3, 1965.

SN 228,357. Wally Frank, Ltd., d.b.a. Hollco, New York, N.Y. Filed Sept. 22, 1965.

GOLDEN HORN

For Tobacco—Namely, Pipe Tobacco.
First use June 1963.

SN 234,179. Consolidated Cigar Corporation, New York, N.Y. Filed Dec. 8, 1965.

PLEBES

For Cigars.
First use Nov. 23, 1965.

SN 234,889. Erik Edinger, Copenhagen, Denmark. Filed Dec. 20, 1965.

Owner of Danish Reg. No. 2,592, dated Oct. 2, 1965.
For Smoking Tobacco.

SN 234,958. Turmac Tobacco Company N.V., Frederiksplein, Netherlands. Filed Dec. 20, 1965.

JOHANNES CULEMBORG

The name "Johannes Culemborg" is fictitious. Owner of Dutch Reg. No. 151,847, dated Apr. 23, 1964.
For Cigarettes.

SN 237,461. P. Lorillard Company, New York, N.Y. Filed Jan. 27, 1966.

TRUE

For Cigarettes.
First use Jan. 20, 1966.

Class 18—Medicines and Pharmaceutical Preparations

SN 234,559. Geigy Chemical Corporation, Ardsley, N.Y. Filed Dec. 14, 1965.

ORTEM

For Hematinic Preparation.
First use Nov. 30, 1965.

SN 236,427. Tamara Royal Jelly Products, Ltd., d.b.a. Tamara Products, New York, N.Y. Filed Jan. 13, 1966.

GINROY

For Food Supplements Containing Vitamins.
First use July 1965.

SN 239,010. C-B Drug Company, Charlotte, N.C. Filed Feb. 17, 1966.

C-B-O

For Medicated Ointment.
First use on or about Sept. 1, 1939.

SN 239,114. Black Rock Pharmaceuticals, Inc., West Memphis, Ark. Filed Feb. 18, 1966.

GENETTE

For Vaginal Suppository.
First use Jan. 14, 1966.

Class 19—Vehicles

SN 220,621. The Kraus Accessories Company, d.b.a. California Custom Accessories Mfg. Company, Gardena, Calif. Filed June 7, 1965.

Applicant disclaims the word "Custom" apart from the mark as shown.
For Automobile Accessories—Namely, Scoops, Radiator Caps, Oil Caps, Hub Caps, Interior Knobs, Gear Shift Balls, Grills, and Pedals.
First use Oct. 10, 1964.

SN 224,056. Adventure Line Manufacturing Co., Inc., Parsons, Kans. Filed July 23, 1965.

ADVENTURE WAGON

The word "Wagon" is disclaimed except as a part of the mark as shown. Owner of Reg. No. 749,322.
For Camper Vehicles, in the Nature of Motor Homes, and Parts and Components Thereof.
First use July 9, 1965.

SN 224,714. The Buehler Corporation, Indianapolis, Ind. Filed Aug. 2, 1965.

THUNDERBALL

For Jet Boats.
First use June 30, 1965.

SN 229,814. Jeffboat, Incorporated, Jeffersonville, Ind. Filed Oct. 11, 1965.

Sunliner

For Houseboats.
First use Aug. 27, 1965.

SN 229,865. Outboard Marine Corporation, Waukegan, Ill. Filed Oct. 11, 1965.

SPORTSMAN

Owner of Reg. No. 549,756.
For Boats.
First use during April 1964.

SN 229,874. Rockwell-Standard Corporation, Pittsburgh, Pa. Filed Oct. 11, 1965.

PAYMASTER

For Components for Vehicles—Namely, Trailer Axles and Leaf Springs.
First use June 16, 1965.

SN 230,176. Mair & Son, Inc., Union Gap, Wash. Filed Oct. 14, 1965.

CHINOOK

For Pick-Up Truck Campers, House Trailers, and Self-Propelled Mobile Homes.
First use on or about Sept. 20, 1956, on pick-up truck campers and house trailers.

SN 230,346. American Metal Products, Inc., Auburn, Mass. Filed Oct. 18, 1965.

CHECK-A-MATIC

For Grocery Carts, Including Means for Mechanical Ejection of Merchandise Therein.
First use Aug. 2, 1965.

SN 230,347. American Metal Products, Inc., Auburn, Mass. Filed Oct. 18, 1965.

CART-A-MATIC

For Grocery Carts, Including Means for Mechanical Ejection of Merchandise Therein.
First use Aug. 2, 1965.

SN 230,417. Moulton Bicycles Limited, Bradford-on-Avon, England. Filed Oct. 18, 1965.

MM

For Bicycles and Parts Thereof.
First use Nov. 10, 1962; in commerce Nov. 30, 1963.

SN 230,983. Westinghouse Electric Corporation, Baltimore, Md. Filed Oct. 21, 1965.

DEEPSTAR

For Manned Submersible Vehicles Used for Underseas Exploration and Study.
First use in or about February 1964.

SN 236,807. Ronald Larry Davis, d.b.a. Torrentair, Arlington, Va. Filed Jan. 19, 1966.

TORRENTAIR

For Heating System for Automobiles With Air-Cooled Engine.
First use Aug. 19, 1965.

SN 245,167. Dayco Corporation, Dayton, Ohio. Filed May 9, 1966.

COLOR MATE

For Automobile Floor Mats.
First use on or about Jan. 19, 1966.

Class 20—Linoleum and Oiled Cloth

SN 228,938. The Ruberoid Co., Jenkintown, Pa. Filed Sept. 29, 1965.

SOFTRED

Owner of Reg. Nos. 626,450 and 805,042.
For Flexible Waterproof Wall, Floor, and Table Top Covering Materials Consisting in Whole or in Part of Organic Plastic.
First use Aug. 23, 1965.

SN 237,540. Congoleum-Nairn Inc., Kearny, N.J. Filed Jan. 28, 1966.

HIGHLIGHT

For Plastic Coverings of the Smooth Surface, Resilient Type for Surfaces Such as Floors, Walls, Countertops, and the Like in the Form of Rolls, Rugs, and Tiles.
First use Jan. 10, 1966.

Class 21—Electrical Apparatus, Machines, and Supplies

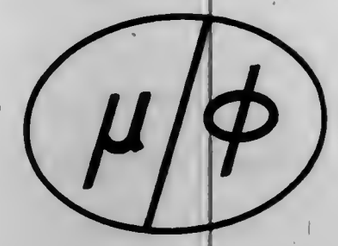
SN 208,876. Advance Transformer Co., Chicago, Ill. Filed Dec. 28, 1964.

FUSE LINK

For Fluorescent Lamp Ballast Having a Temperature Sensitive, Non-Resetting Protector Built Therein.
First use on or about May 1, 1962.

SN 215,526. MIAL S.p.A., Milan, Italy. Filed Apr. 1, 1965.

MIAL



Owner of Italian Reg. No. 143,762, dated June 16, 1958.
For Electrical Components—Namely, Capacitors, Resistor-Type Potentiometers, Metal Film Resistors, Carbon Film Resistors, and Parts Therefor.

SN 215,527. MIAL S.p.A., Milan, Italy. Filed Apr. 1, 1965.

MIAL

Owner of Italian Reg. No. 112,330, dated May 3, 1952.
For Electrical Components—Namely, Capacitors, Resistor-Type Potentiometers, Metal Film Resistors, Carbon Film Resistors, and Parts Therefor.

SN 220,868. Microphase Corporation, Cos Cob, Conn. Filed June 10, 1965.

The symbol "μ" is the Greek letter mu and the symbol "φ" is the Greek letter phi.

For Electronic and Microwave Components and Solid State Devices—Namely, Electrical Filters of Low Pass, High Pass, Band Pass, and Band Elimination Types in the High Frequency, Very High Frequency, Ultra High Frequency and Microwave Ranges, Including Waveguide and Coaxial Types; Channel Filters; Multiplexers; Preselectors; Equalizers; Mixers; Hybrids; Power Dividers; Frequency Modulators; Harmonic Generators; Converters; Frequency Multipliers; Detectors; Amplifiers; Pre-Amplifiers; Antenna Feeders and Couplers; Diode Switches; Stable Transistor Power Supplies; Phase Shifters; Variable Attenuators; Telemetry Converters; and Microwave Receivers.

First use on or about Nov. 23, 1954.

SN 223,275. Audiophonics Corporation, Beverly, Mass. Filed July 14, 1965.

CERRA-DYNAMIC

For Microphones.
First use May 7, 1965.

SN 223,359. Self-Organizing Systems, Inc., Garland, Tex. Filed July 14, 1965.

CHEMTRON

For Magnetically Actuated Reed Relays and Electrochemical Devices of the Solion Type—Namely, Solion Tetrodes and Solion Diodes.
First use on or before Dec. 17, 1964.

SN 223,787. The Gutan Company, North Hill, Pa. Filed July 20, 1965.

B-A-P

For Selenium Rectifier With Resistor, for Attachment to an Induction Coil in an Ignition System for Internal Combustion Engines.
First use Mar. 25, 1965.

SN 223,976. Delta Electronics, Alexandria, Va. Filed July 22, 1965.

Applicant disclaims the word "Electronics" apart from the mark as a whole.

For Electronic Equipment—Namely, Tuning Network, Antenna Switching Equipment, Impedance Bridges, Antenna Systems, Tunable Filters, Monitor Amplifiers, Antenna Multicouplers, Folding Antennas, and Power Inverters.

First use Jan. 28, 1963.

SN 224,006. John D. McDonald, d.b.a. Figuremagic, Dallas, Tex. Filed July 22, 1965.

For Electronic Exercise Machines for Muscle Toning and Temporarily Increased Calorie Consumption in Humans.
First use Apr. 10, 1961.

SN 224,551. Pinkerton Security, Inc., Detroit, Mich. Filed July 29, 1965.

For Electronic Security Equipment for Fire and Burglary Protection, and Automatic Telephone Dialing Alarm Systems.
First use June 23, 1964.

SN 225,745. Electronic Engineering Company of California, Santa Ana, Calif. Filed Aug. 16, 1965.

STAKSWITCH

Applicant disclaims the word "Switch" apart from the mark as shown.

For Electric Switches, Including Multiple Switch Assemblies.
First use June 18, 1965.

SN 227,895. The Verplex Company, Essex, Conn. Filed Sept. 15, 1965.

PORT-A-LIER

For Lamps and Lighting Fixtures.
First use March 1965.

SN 228,222. Vapor Corporation, Chicago, Ill. Filed Sept. 20, 1965.

The drawing is lined for red.

For Static Inverter for Converting Direct Current to Alternating Current.
First use Mar. 31, 1965.

SN 229,264. Merkle-Korff Gear Co., Chicago, Ill. Filed Oct. 4, 1965.

MK

Owner of Reg. No. 686,628.
For Fractional Horsepower Electric Motors.
First use November 1964.

SN 229,332. Atlas Supply Company, Springfield, N.J. Filed Oct. 5, 1965.

ATLAS

Owner of Reg. Nos. 298,350, 598,695, and others.
For Signal Flasher for Use on Automobiles.
First use Aug. 13, 1965.

SN 231,818. Emerson Electric Co., St. Louis, Mo. Filed Oct. 29, 1965.

NU/RATE

For Electrical Motors.
First use Sept. 27, 1965.

SN 240,601. Electronized Chemicals Corporation, Burlington, Mass. Filed Mar. 10, 1966.

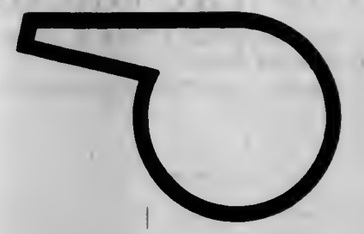
INSULTITE

For Heat-Shrinkable Insulation, Such as Tubing and Tape.
First use Mar. 23, 1965.

SN 240,703. Bivar Company, Palo Alto, Calif. Filed Mar. 11, 1966.

For Dissolvable Spacer Rings for Circuit Board Components.
First use Oct. 15, 1965.

Class 22—Games, Toys, and Sporting Goods



SN 216,704. Kohner Bros., Inc., New York, N.Y. Filed Apr. 16, 1965.

Owner of Reg. No. 676,923.

For Construction Toys, Educational Toy Blocks, Toy Hobby Craft Kits, Action Toys, and Component Parts, for Playing Skill and Spelling Games.
First use Mar. 31, 1965.

SN 229,140. Shakespeare Company, Kalamazoo, Mich. Filed Oct. 1, 1965.

For Golf Balls.
First use Aug. 23, 1965.

SN 233,731. Northwestern Golf Company, Chicago, Ill. Filed Dec. 1, 1965.

MUSCLE BACK

For Golf Clubs.
First use on or about Aug. 1, 1965.

Class 23—Cutlery, Machinery, and Tools, and Parts Thereof

SN 199,788. Canadian Allis-Chalmers Limited, Lachine, Quebec, Canada. Filed Aug. 13, 1964.

FLEX-TEX

Priority claimed under Sec. 44(d) on Canadian application filed Apr. 22, 1964; Reg. No. 141,363, dated Aug. 20, 1965.

For Couplings of the Type Utilized To Transmit Torque Between Driving and Driven Shafts.
First use June 22, 1964; in commerce June 22, 1964.

SN 201,301. Pemco, Inc., Roselle, Ill., by change of name from Pavement Equipment Mfg. Co., Roselle, Ill. Filed Sept. 4, 1964.

PEMCO

For Oil Tight Casings for Protection of Chains, Belts, and Gears, Chain and Belt Guards, and Motor Reducer Covers.
First use December 1958.

SN 219,904. James C. Price, d.b.a. The Hi-Fog Company, Montebello, Calif. Filed May 27, 1965.

For Liquid Insecticide Spray Equipment.
First use Oct. 16, 1961.

SN 221,881. American Chain & Cable Company, Inc., New York, N.Y. Filed June 24, 1965.

CONTROLMASTER

For Throttle and Shift Control Mechanisms for Marine Use.
First use Mar. 15, 1965.

SN 222,382. Koehler-Dayton, Inc., Dayton, Ohio. Filed June 30, 1965.

ATLAS VAC-MACHINE

No claim is made to exclusive rights in the word "Machine" apart from the mark as shown.

For Plastic Forming and Packaging Machinery, and Parts Therefor.

First use June 1958.

SN 223,857. Gebrüder Busatis, Remscheid-Lennep, Germany. Filed July 16, 1965.

BUSATIS

Priority claimed under Sec. 44(d) on German application filed Feb. 3, 1965; Reg. No. 805,846, dated June 24, 1965.

For Agricultural Reapers and Parts Therefor—Namely, Drive and Transmission Chains, Pivot Pins, Reaper Bars, Knife-Grinding Machines, Drive Rods, Shoe Plates, Cleaning Plates, Knife Holders, Fingers, Finger Plates, Knife Heads and Knife Head Plates; and Commercial Machine Knives—Namely, Reaper Blades, Special Cutter Knives, and Twine Knives.

SN 224,516. The Cleanola Company, Glenshaw, Pa. Filed July 29, 1965.

CLEANOLA

For Manually and Mechanically Operated Spray Guns and Industrial Spraying Equipment for Applying Paint and Other Protective and Decorative Coatings.

First use Jan. 24, 1900.

SN 228,262. Landbouwwerktuigen- en Machinefabriek H. Vissers N.V., Nieuw Vennep, Netherlands. Filed Sept. 21, 1965.

PENTON

Owner of Dutch Reg. No. 153,073, dated July 8, 1964.

For Fertilizer Spreaders.

SN 228,543. Ladish Co., Cudahy, Wis. Filed Sept. 24, 1965.

LAD-ALLOY

For Saw Blades.

First use May 13, 1965.

SN 228,544. Ladish Co., Cudahy, Wis. Filed Sept. 24, 1965.

LAD-CUT

For Saw Blades.

First use May 13, 1965.

SN 228,659. Delta Manufacturing and Engineering Corp., Dallas, Tex. Filed Sept. 27, 1965.

HWB

For Hot Water Blast Apparatus, Industrial Cleaning Apparatus, and Vehicle Washing Apparatus.

First use on or about Aug. 1, 1962.

SN 228,820. Graphic Engineers, Inc., San Bernardino, Calif. Filed Sept. 28, 1965.

Count-o-veyor

For Machines for Conveying, Counting and Stacking Newspapers or Other Printed Material Delivered by Printing Presses.

First use Apr. 26, 1963.

SN 228,825. Kaspar Wire Works, Incorporated, Shiner, Tex. Filed Sept. 28, 1965.

"K-MECH"

For Coin Responsive Mechanism for Use With Article Dispensing Apparatus.

First use Jan. 11, 1965.

SN 228,986. Black, Sivalls & Bryson, Inc., Kansas City, Mo. Filed Sept. 30, 1965.

PINEHURST

For Lawn Mowers.

First use July 1, 1964.

SN 229,021. Miniature Precision Bearings, Inc., d.b.a. Split Ballbearing, Keene, N.H. Filed Sept. 30, 1965.

SBB

For Ballbearings.

First use April 1957.

SN 229,399. Applied Power Industries, Inc., Milwaukee, Wis. Filed Oct. 6, 1965.

DYNAWINCH

For Hydraulic Winches for Mobile and Construction Equipment.

First use July 27, 1965.

SN 230,685. Walter Peters, Solingen-Wald, Germany. Filed Oct. 20, 1965.

Laurus

For Scissors and Shears for Household and Garden Use; Carving Sets; Tool Sets for Home Use and Consisting of Pocket-Knife, Pliers, Hammer, Screwdriver, Awl, Drill, Tape Measure, Corkscrew, Tin Opener, Chisel, File, Wrench, Saw; Fondue and Cocktail Forks, Nutcrackers, Bottle Openers, Can Openers, Nut Pickers, and All Kinds of Forks, Spoons, and Knives.

First use 1936; in commerce January 1960.

SN 231,077. Eltra Corporation, Brooklyn, N.Y. Filed Oct. 22, 1965.

LINOFILM

For Phototypesetting Machines, and Parts and Supplies for Such Machines, Including Particularly Typographical Font Plates, and Auxiliary Equipment for Such Machines Such as Tape Reading Devices; and Keyboard Operated Machines for Producing Control Tapes for Phototypesetting Machines, and Parts and Supplies for Such Machines, Including Particularly Typographical Character Width Coding Elements, and Auxiliary Equipment for Such Machines Such as Tape Reading Devices and a Control Setting and Selecting Device; Photocomposing Machines; and Storage Racks and Magazines for the Aforesaid Width Coding Elements and Font Plates, Respectively; and Tape Splicing Apparatus; and Machines for Reading Tapes Simultaneously To Provide a Composite Tape; and Tape Converters for Reading Tapes of One Format and Producing Tapes of a Different Format; and Apparatus for Processing Photosensitive Papers and Films That Have Been Exposed in Phototypesetting and Photocomposing Machines.

First use 1950 on phototypesetting machines.

SN 231,609. Ronald J. Vlasin, d.b.a. V & V Manufacturing Company, Crete, Nebr. Filed Oct. 24, 1965.

SCOTCH VALVE SAVER

The words "Valve Saver" are disclaimed apart from the mark as shown.

For Valve Resurfacing Tools.

First use May 17, 1965.

SN 232,614. The Torrington Company, Torrington, Conn. Filed Nov. 12, 1965.

PROGRESS THROUGH PRECISION

The drawing is lined for the color green, but the color forms no part of the mark. Owner of Reg. Nos. 202,735, 793,288, and others.

For Anti-Friction Bearings Including Straight Roller, Tapered Roller, Spherical Roller, Needle and Ball Bearings; Ball Slide Bearings; Ball, Roller and Needle Thrust Bearings; Needle and Bearing Races; Also Self-Aligning Ball Bushings; Cage and Roller Assemblies; and Small Machine Parts Made to Customers' Specifications.

First use Mar. 1, 1965.

SN 232,840. Howell Macduff, d.b.a. Edward D. Strand Company, West Boylston, Mass. Filed Nov. 17, 1965.

BLACK STRAND

For Metal Cutting Tools.

First use on or about May 22, 1950.

SN 234,337. Crown Controls Corporation, New Bremen, Ohio. Filed Dec. 10, 1965.

HANDLE WITH CROWN

Owner of Reg. No. 701,748.

For Materials Handling Equipment Including Hand Propelled Hand Lift Trucks, Power Propelled Hand Lift Trucks, Hand Propelled Power Lift Trucks, Lift Trucks, Power and Hand Propelled Pallet Trucks, Power Tugs, Fork Lift Trucks, Platform Lift Trucks, Drum and Carton Handlers, Special Application Lift Trucks, Power Propelled Power Lift Trucks, Power Propelled Power Lift Pallet Trucks, and Accessories and Parts Therefor.

First use Nov. 26, 1965.

SN 235,636. Draper Corporation, Hopedale, Mass. Filed Jan. 3, 1966.

TRU-LOC

For Shuttle Spring Assemblies.

First use Aug. 5, 1963.

SN 236,715. Herbert C. Brauchla, Fremont, Ohio. Filed Jan. 18, 1966.

BRAUCHLASIZER

For Riffle Screen Sizing Units.

First use during September 1965.

SN 237,580. Morton International, Inc., Chicago, Ill. Filed Jan. 28, 1966.

For Seed Treating Equipment, Equipment for Dispensing Salt and Brine, Brine Spraying Equipment, and Topping Equipment.

First use on or about Oct. 7, 1965.

SN 237,606. Washington Forge, Incorporated, Englishtown, N.J. Filed Jan. 28, 1966.

For Stainless Steel Flatware.

CLASSIC STAR

First use on or about Jan. 15, 1958.

SN 237,607. Washington Forge, Incorporated, Englishtown, N.J. Filed Jan. 28, 1966.

TROPIC STAR

For Table and Kitchen Cutlery—Namely, Table Knives, Forks and Spoons, Spatulas, Cleavers, Carving Sets, Steak Sets, and Paring and Bread Knives.

First use on or about June 1, 1959.

SN 237,609. Washington Forge, Incorporated, Englishtown, N.J. Filed Jan. 28, 1966.

MIRILUIM

For Carving Knives, Kitchen Knives, and Steak Knives.
First use on or about Nov. 1, 1956.

SN 244,551. Guhl & Scheibler A.G., Basel, Switzerland. Filed Apr. 29, 1966.

COLLAMAT

Owner of Swiss Reg. No. 197,508, dated Apr. 2, 1963.
For Equipment for the Automatic Adherence and Detachment of Self-Adhesive Labels.

SN 247,550. Brown & Sharpe Manufacturing Company, North Kingstown, R.I. Filed June 8, 1966.

FLICR

For Pneumatic Relay Valve.
First use Nov. 12, 1965.

Class 24 — Laundry Appliances and Machines

SN 228,347. Eastern Cyclone Industries, Inc., Clifton, N.J. Filed Sept. 22, 1965.

The mark consists of the letters "ECI."
For Machinery Particularly Adaptable for the Laundry and Textile Fields, Including, but Not Limited to, Lint Collectors, Washer and Dry Tumblers, Loading Hoppers, Air Head Washer and Tumbler Loading Hoppers, Pneumatic Classifying Systems, Belt Conveyors, Sour, Blue and Bleach Tanks, Soap Supply System, Small Piece Counters, and Other Related Material Handling Equipment Such as Rail Systems, Sling Loaded Bag Systems, and Roller and Skate Conveyors.
First use approximately November 1963.

Class 26 — Measuring and Scientific Appliances

SN 206,917. CSF—Compagnie Generale de Telegraphie Sans Fil, Paris, France. Filed Nov. 25, 1964.

OSCILLOPERTURBOGRAPHE MASSON-CARPENTIER

For Electromechanical Recorder, With Memory, for Recording Disturbances.
First use January 1958; in commerce January 1958.

SN 213,769. Engineering Model Associates, Los Angeles, Calif. Filed Mar. 10, 1965.

For Model Parts for Engineering and Structural Designs.
First use Jan. 11, 1956.

SN 217,512. Safety-Sight, Inc., Baltimore, Md. Filed Apr. 27, 1965.

"SAFETY SIGHT"

For Indicator and Sight Glasses for Use in Vehicle Radiators.
First use Feb. 10, 1965.

SN 218,328. The Sheffield Corporation, Dayton, Ohio. Filed May 7, 1965.

CORDAX

For Position Monitoring Device for Taking Measurements.
First use on or about Feb. 17, 1965.

SN 224,621. Ingenjorsfirma A. Alfredéen AB, Bandhagen, Sweden. Filed July 30, 1965.

COMBIMETER

For Pneumatic Measuring Apparatus for Making Multiple Measurements.
First use on or about Nov. 1, 1958; in commerce on or about Apr. 1, 1964.

SN 225,100. B-D Laboratories, Inc., East Rutherford, N.J. Filed Aug. 6, 1965.

For Laboratory Ware—Namely, Petri Dishes, Culture Tubes, Slide Plates, Filtering Funnels, Fluid Containers, Swab in Container, and Similar Products.
First use on or about Apr. 11, 1960.

SN 230,657. Latronics Corporation, Latrobe, Pa. Filed Oct. 20, 1965.

INFRATIO

For Pyrometers.
First use Sept. 15, 1965.

SN 230,659. Latronics Corporation, Latrobe, Pa. Filed Oct. 20, 1965.

RECORDETTE-4 STRIPCORDER

For Temperature Recording Instruments.
First use Aug. 23, 1965.

Class 31 — Filters and Refrigerators

SN 218,686. Pall Corporation, Glen Cove, N.Y. Filed May 12, 1965.

TRI-DOT

The drawing is lined for red, but color is not claimed as a part of the mark.
For Filter Fittings.
First use Aug. 25, 1964.

SN 221,223. Technical Development Company, Glenolden, Pa. Filed June 15, 1965.

TURBOMAG

For Combination Oil Filter and Detection Unit for Turbine Engines.
First use July 23, 1964.

Class 32 — Furniture and Upholstery

SN 222,910. Beco Products Corporation, Chicago, Ill. Filed July 8, 1965.

For Frames for Pictures and Photos.
First use June 23, 1965.

SN 224,721. Cleveland Chair Company, Inc., Cleveland, Tenn. Filed Aug. 2, 1965.

Leisure King...

For Upholstered Reclining Chairs.
First use Apr. 19, 1965.

SN 235,398. Eclipse Sleep Products, Inc., Brooklyn, N.Y. Filed Dec. 28, 1965.

RESILON

For Mattresses and Bedding Items—Namely, Cushions.
First use Dec. 1, 1965.

Class 34 — Heating, Lighting, and Ventilating Apparatus

SN 225,006. Cardinal Products Company, Saginaw, Mich. Filed Aug. 5, 1965.

Cardinal

Owner of Reg. No. 757,348.
For Gas-Fired, Make-Up Air Heating Systems, Louvres, Dampers, Roof Hoods, Confessional Fans, and Louvred Penthouses.
First use Sept. 4, 1958.

SN 230,174. Lucky Furniture Manufacturing Company, Inc., Etowah, Tenn. Filed Oct. 14, 1965.

CHILLER-DILLER

For Cooling or Warming Food Storage Unit for Installation in Motor Vehicles.
First use Oct. 5, 1965.

Class 35 — Belting, Hose, Machinery Packing, and Nonmetallic Tires

SN 245,168. Dayco Corporation, Dayton, Ohio. Filed May 9, 1966.

FABRIFLEX

For Fluid Conveying Hose.
First use on or about Feb. 17, 1966.

Class 36 — Musical Instruments and Supplies

SN 197,747. Monumental Films and Recordings Inc., Baltimore, Md. Filed July 13, 1964.

MONUMENTAL

Owner of Reg. No. 651,490.
For Commercial Recordings and Commercial Tapes.
First use Dec. 15, 1953.

SN 223,457. Rheem Manufacturing Company, New York, N.Y. Filed July 15, 1965.

Owner of Reg. Nos. 530,594, 731,608, and others.
For Sound Recording and Sound Reproducing Apparatus—Namely, Tape Recorders and Tape Sound Reproducers, Parts and Accessories Therefor Including Tapes, and Guitar Amplifiers.
First use June 10, 1965.

SN 223,458. Rheem Manufacturing Company, New York, N.Y. Filed July 15, 1965.

ROBERTS

Owner of Reg. Nos. 717,601, 723,043, and 731,608.
For Sound Recording and Sound Reproducing Apparatus—Namely, Tape Recorders and Tape Sound Reproducers, Parts and Accessories Therefor, Unrecorded and Pre-Recorded Tapes, Phonographs, and Guitar Amplifiers.
First use May 1958.

SN 244,949. Soundex Radio Corp., Brockton, Mass. Filed May 5, 1966.

SOUNDEX STEREO 8

The term "Stereo 8" is disclaimed apart from the mark as shown.
For Stereo Tape Sound Reproducing Systems for Automobiles.
First use Apr. 29, 1966.

Class 37 — Paper and Stationery

SN 222,195. The Parker Pen Company, Janesville, Wis. Filed June 28, 1965.

TOUCHÉ

For Writing and Marking Pens, Mechanical Pencils, and Pen Nibs.
First use Feb. 5, 1965.

SN 223,723. Reynolds Metals Company, Richmond, Va. Filed July 19, 1965.

SHRINKASE

For Plastic Film for Packaging.
First use on or about June 29, 1965.

SN 225,410. Edmund Scientific Co., Barrington, N.J. Filed Aug. 10, 1965.

PIKKER-UPPERS

For Adhesive Devices, Such as Pencil Tops and Finger Rings, for Lifting Papers and Small Objects.
First use July 1, 1965.

SN 225,888. Norcross, Inc., New York, N.Y. Filed Aug. 17, 1965.

PASTEL POODLES

For Wrapping Paper.
First use May 12, 1965.

SN 227,608. Nationwide Papers Incorporated, Chicago, Ill. Filed Sept. 10, 1965.

Pen-Ease

Owner of Reg. No. 361,523.
For Printing Papers, Bond Paper, Duplicator Paper, and Mimeograph Paper.
First use during July 1955.

SN 228,573. Standard International Corporation, Holyoke, Mass. Filed Sept. 24, 1965.

TIDY WRAP

Applicant disclaims any exclusive rights in the word "Wrap" apart from the mark as shown. Owner of Reg. Nos. 578,572, 771,733, and others.
For Wrapping Paper Used for Foods.
First use Aug. 19, 1965.

SN 229,316. Venus Pen & Pencil Corporation, New York, N.Y. Filed Oct. 4, 1965.

FLAG

For Pencils.
First use Aug. 31, 1965.

SN 229,739. Arvey Corporation, Chicago, Ill. Filed Oct. 11, 1965.

SANI-SEAL

For Envelopes.
First use on or about June 22, 1965.

SN 230,222. The Albrecht Company, Baltimore, Md. Filed Oct. 15, 1965.

ATTACH-O-STRIP

For Self-Adhesive Strips Attached to Loose Leaf Sheets To Fit in a Ring Binder Without the Need for Punching Holes.
First use Sept. 23, 1965.

SN 235,297. Hammermill Paper Company, Erie, Pa. Filed Dec. 27, 1965.

BonDuGraph

For Paper for Writing, Printing, Duplicating, and General Office Use.
First use Oct. 6, 1965.

SN 236,532. Weyerhaeuser Company, Tacoma, Wash. Filed Jan. 14, 1966.

TORINO

For Text and Cover Paper.
First use Sept. 30, 1965.

SN 236,990. Gulf Oil Corporation, Pittsburgh, Pa. Filed Jan. 21, 1966.

SPENSEAL

For Heat Laminated Cellophane for Packaging Materials.
First use at least as early as Dec. 6, 1965.

SN 237,356. Kimberly-Clark Corporation, Neenah, Wis. Filed Jan. 26, 1966.

DELICARE

For Lotion Treated Bathroom Tissue Especially for Hemorrhoid Sufferers.
First use July 15, 1964.

SN 237,740. The Procter & Gamble Company, Cincinnati, Ohio. Filed Feb. 1, 1966.

United States Adopted Names

List No. 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
descinolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name;* all other names on the list are *proposed for adoption.*

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldesone: antibacterial
*nitarsone: veterinary histomonastat
*nitrazepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic

•prednival: topical anti-inflammatory
•prilocaine hydrochloride: local anesthetic
•propiram fumarate: analgesic
•pyrantel tartrate: anthelmintic
quilaxine maleate: oxytocic
•rifamide: antibacterial
•roxarsone: veterinary growth simulant
seperidol hydrochloride: neuroleptic
•sodium ampicillin: antibiotic
•sodium edetate: chelating agent
•sodium ethacrynate: diuretic
sulfabenz: veterinary antibacterial and anticoccidial
sulfafen: antibacterial; anticoccidial agent
•tetramisole hydrochloride: anthelmintic
•tetroquinone: treatment of keloids
thyroglobulin: thyroid preparation
•trimoxamine hydrochloride: antihypertensive
•trisodium edetate: chelating agent
•viridofulvin: antifungal antibiotic
zolertine hydrochloride: vasodilator; anti-adrenergic; anti-hypertensive

Disclaimer

3,019,211.—*Harry E. Albert*, Lafayette Hill, Pa. USE OF PHENYLENE DI-TERTIARY AMINES IN RUBBER. Patent dated Jan. 30, 1962. Disclaimer filed May 11, 1966, by the assignee, *The Firestone Tire & Rubber Company*.

Hereby enters this disclaimer to claims 1, 2, 4 and 5 of said patent.

Adjudicated Patents

(C.A. Minn.) Schwank Patent No. 2,775,294 (158—116), for RADIANT BURNER, *Held* invalid. *American Infra-Red Radiant Co.* v. *Lambert Industries, Inc.*, 360 F.2d 977; 149 USPQ 722.

(C.A. Mo.) Graves Patent No. 2,842,072 (107—14), for FOOD PROCESSING MACHINE. Claims 1 to 3 *Held* invalid. *Kell-Dot Industries, Inc.* v. *Graves*, 261 F.2d 25; 149 USPQ 717.

(C.A. Minn.) Schwank Patent No. 2,870,830 (239—590), for GAS BURNER, *Held* invalid and not infringed. *American Infra-Red Radiant Co.* v. *Lambert Industries*, 360 F.2d 977; 149 USPQ 722.

(C.A. Tex.) Levey and Harvey Patent No. 3,000,576 (172—760), for SPRAY GUN. Claims 1 to 6 and 8 *Held* valid and infringed. *Gray Co.* v. *Speed-Flo Mfg. Corp.*, 361 F.2d 489; 149 USPQ 801.

(C.A. Ill.) Skirow Patent No. 3,064,872 (229—15), for CUP CONTAINER. Claims 6 and 7 *Held* invalid and not infringed. *Skirow* v. *Roberts Colonial House, Inc.*, 361 F.2d 388; 149 USPQ 882.

(C.A. Calif.) Page Reissue Patent No. 25,122 (128—142), for SAFETY-FIRST UNDERWATER BREATHING APPARATUS. Claims 1 to 18 *Held* invalid. *Page* v. *U.S. Divers Co.*, 361 F.2d 478; 149 USPQ 805.

Notification Re Conflict in Assignment in Certain Applications

Effective September 12, 1966, Assignment Branch will discontinue mailing notification in cases where there is a conflict in assignment between an original application and its divisional, continuation, substitute, or continuation-in-part application.

Assignments from original applications are applied without charge ONLY to divisional, continuation, or substitute applications where the date of the assignment is prior to the filing date of the later-filed application. (Continuation-in-part applications require separate assignments if they are to be issued to the assignee.)

Practitioners are reminded of the provisions of Rule 334. Unless an assignment is filed at or prior to the date of payment of the issue fee, the patent will normally be issued in the name of the inventor.

Section 306 of the Manual of Patent Examining Procedures will be amended appropriately.

W. R. ARMSTRONG,
Director, Office of Patent Services.

Concurred:
(Signed) R. A. WAHL,
Assistant Commissioner.

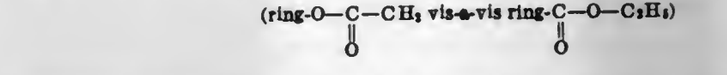
DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

IN RE PHILIP M. CARABATEAS

No. 7476. Decided March 24, 1966. Petition for rehearing denied May 5, 1966

[53 CCPA —; 357 F.2d 998; 149 USPQ 44]



1. PATENTABILITY—COMPOUND—"REVERSE ESTERS"—OBVIOUSNESS—IMPROVEMENT IN ACTIVITY—*In re Carabateas* (52 CCPA 1386) REVIEWED.

"We have re-examined the Elpern references on which heavy reliance was placed in our original Carabateas opinion [52 CCPA 1386]. While we are of the view that those references, together with Cutler, collectively establish obviousness of the structural formula and analgesic activity both of appellant's compounds claimed there and in the present compound, we think we erroneously concluded in Carabateas that the Elpern patents would suggest to one of ordinary skill that *any improvement* in analgesic activity would necessarily inhere in compounds derived from piperidinol,

when compared to otherwise identical compounds of the carboxylate structure,

2. SAME—SAME—SAME—SAME—*In re Carabateas* (52 CCPA 1386) REVIEWED.

"* * * we assumed [in *In re Carabateas*, 52 CCPA 1386] that the '4-acetoxy' compound of Elpern II was identical to (e.g. the exact 'reverse ester') the *ethyl*-4-carboxylate compound of Elpern I but for reversal of the ester linkage. In fact it is not, as comparison of the respective structures

demonstrates. We think such a comparison of ester homologues to be too tenuous to suggest that any improvement would be obtained solely because of reversal of the ester linkage. That comparison being the controlling evidence in Carabateas, we think the decision there rendered necessarily is incorrect."

3. SAME—SAME—OBVIOUSNESS—GREATER EFFECTIVENESS.

"In the absence of a suggestion in the present record that the nature of appellant's improvement would be expected, we think appellant has presented clear and convincing evidence of the greater effectiveness of the claimed compound over the prior art, sufficient here to establish patentability of the compound. *In re Lohr*, 50 CCPA 1274, 317 F.2d 338, 137 USPQ 548. Under the circumstances, we think the record fails to support a finding that the subject matter as a whole would be obvious to one of ordinary skill in the art."

4. SAME—PARTICULAR SUBJECT MATTER—1-(3-HYDROXY-3-PHENYLPROPYL)-4-PHENYL-4-PROPIONOXY-PIPERIDINE.

The decision of the Board of Appeals, refusing a claim to 1-(3-hydroxy-3-phenylpropyl)-4-phenyl-4-propionoxy-piperidine as unpatentable over the prior art, is reversed.

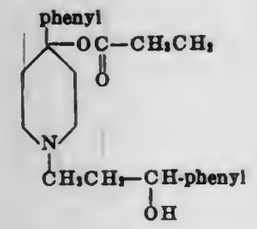
APPEAL from the Patent Office. Serial No. 85,195.

REVERSED.

Laurence and Laurence (*Dean Laurence*, *Herbert I. Sherman* of counsel) for appellant.

Clarence W. Moore (*Jack E. Armore* of counsel) for the Commissioner of Patents.

Before WORLEY, *Chief Judge*, and RICH, MARTIN, SMITH, and ALMOND, JR., *Associate Judges*



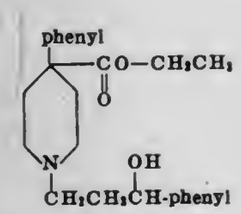
WORLEY, *Chief Judge*, delivered the opinion of the court.

This appeal is from the decision of the Board of Appeals affirming the Examiner's rejection of claims 1 and 2 in appellant's patent application [1] for "4-aryl-4-(lower acyloxy)-1-(3-aryl-3-hydroxypropyl)-piperidines and their preparation." Appellant has withdrawn appeal of claim 2.

The appealed subject matter is represented by the chemical compound of claim 1:

1. 1-(3-hydroxy-3-phenylpropyl)-4-phenyl-4-propionoxy-piperidine.

That compound has the structural formula



and is useful as an analgesic.

The references are:

Elpern II, 2,846,437, August 5, 1958.
Elpern I, 2,850,500, September 2, 1958.
Pohland II, 2,904,550, September 15, 1959.
Pohland I, 2,951,080, August 30, 1960.
Cutler et al., 2,962,501, November 29, 1960.

The disclosure of those references was reviewed by this court in *In re Carabateas*, 52 CCPA 1386, 345 F.2d 1013, 145 USPQ 549, 551–3, and need not be further detailed here beyond noting that Cutler and Pohland I disclose an analgesic of the structural formula

The Examiner found appellant's piperidinol ester obvious from a consideration of the Cutler, Elpern and Pohland patents, employing reasoning similar to that used by the Examiner in Carabateas.

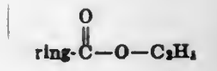
Appellant contends that an affidavit showing the compound of claim 1 to be nineteen times more active as an analgesic than the "reverse ester" compound of Cutler and Pohland I when administered subcutaneously is persuasive evidence of unobviousness and patentability of the compound.[2] As reference to our decision in Carabateas will establish, we thought the Elpern patents collectively suggested that *piperidinol* esters having the structure of appellant's compounds there claimed would possess greater analgesic activity, perhaps twice as great, than the "reverse esters" which Cutler obtained from the requisite piperidine *carboxylic acid*. We also referred to a Braenden publication in that record, not relied on by the Examiner in his rejection,

[1] Serial No. 85,195, filed January 27, 1961.

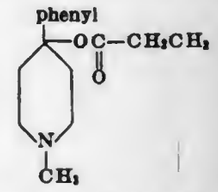
[2] That figure was established by a finding that appellant's compound and that of Cutler were 3220 times and 173 times, respectively, more potent than meperidine, a well known analgesic, on a molar basis.

which showed that in changing from the carboxylate structure of meperidine

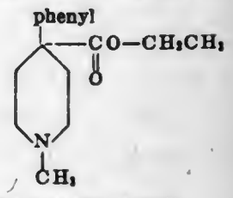
to the "reverse" structure



the substituent being in the 4-position of the ring, and the remainder of the molecule being kept the same, a five to ten-fold increase in analgesic activity is observed.[3]



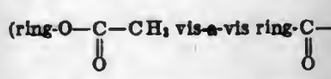
[1] We have re-examined the Elpern references on which heavy reliance was placed in our original Carabateas opinion. While we are of the view that those references, together with Cutler, collectively establish obviousness of the structural formula and analgesic activity both of appellant's compounds claimed there and the present compound, we think we erroneously concluded in Carabateas that the Elpern patents would suggest to one of ordinary skill that *any improvement* in analgesic activity would necessarily inhere in compounds derived from piperidinol,



when compared to otherwise identical compounds of the carboxylate structure,[4]

[3] That appears consistent with the discussion in *In re Lunsford*, 51 CCPA 1000, 327 F.2d 526, 140 USPQ 425, wherein it was observed that the analgesic prodine, having the formula

is more potent than the analgesic meperidine, having the formula



The Braenden reference is not in the present record.

[4] We said in Carabateas:

> Referring to the Elpern patents, it will be seen that the Elpern II "1-(3-phenoxypropyl)-4-acetoxy" compound, which has the same sort of ester structure as appellant's compounds, possesses *twice* the analgesic activity of the Elpern I ethyl (3-phenoxypropyl)piperidine-4-carboxylate. Compared with the Elpern I ethyl (2-phenoxy*ethyl*)piperidine-4-carboxylate and ethyl (4-phenoxy*butyl*)piperidine-4-carboxylate esters, this same Elpern II compound, albeit not the exact "reverse ester" but instead a homolog thereof, is, respectively, *four* and *eight times* more effective as an analgesic. We believe this amply suggests that esters having the structure of appellant's compounds will posses greater analgesic activity than their "reverse esters."

[2] In drawing that conclusion, we assumed that the "4-acetoxy" compound of Elpern II was identical to (e.g. the exact "reverse ester") the *ethyl*-4-carboxylate compound of Elpern I but for reversal of the ester linkage. In fact it is not, as comparison of the respective structures

demonstrates. We think such a comparison of ester homologues to be too tenuous to suggest that any improvement would be obtained solely because of reversal of the ester linkage. That comparison being the controlling evidence in Carabateas, we think the decision there rendered necessarily is incorrect.

[3] In the absence of a suggestion in the present record that the nature of appellant's improvement would be expected, we think appellant has presented clear and convincing evidence of the greater effectiveness of the claimed compound over the prior art, sufficient here to establish patentability of the compound. *In re Lohr*, 50 CCPA 1274, 317 F.2d 338, 137 USPQ 548. Under the circumstances, we think the record fails to support a finding that the subject matter as a whole would be obvious to one of ordinary skill in the art.

[4] The decision of the Board is reversed.

REVERSED.

RICH, *J.*, concurring.

I am satisfied this is a clear case for reversal, but for reasons other than those stated by the majority.

While I agree that the art of record collectively establishes obviousness of the structural formula and analgesic activity of the compound defined by the claim on appeal, I am unable to agree that a finding of *an* improvement in activity in esters of the type here involved, obtained from piperidinols, compared to those obtained from piperidine carboxylic acids, would be wholly *unexpected* to one of ordinary skill in the art with those references before him. To conclude otherwise, it seems to me, is to deny the realities of the situation; for the plain fact is that, without exception, the Elpern II compounds demonstrate potency greater than that possessed by the Elpern I compounds. While those compounds differ structurally in two respects, there is no reason to believe that either is *not* responsible, at least in part, for that increase in activity.

I would therefore reverse on what to me is a much sounder basis, both in law and on the facts presented, namely that the art makes no suggestion whatever that a reversal of the ester linkage would result in an increased activity *approximating the nineteen-fold increase found by appellant*. At the very best, the art suggests an increase of the order of four to eight times. This is a far cry from what appellant found.

The question is not, it seems to me, whether the art suggests *an* improvement, but rather whether it reasonably suggests *the particular* improvement relied upon for patentability in both its qualitative and quantitative sense. See *In re Lunsford* (P.A. 7478), decided March 17, 1966, 53 CCPA —, —F.2d —, — USPQ —. As in all section 103 cases, the important consideration is: does the prior art make obvious to those of ordinary skill what appellant has found?

U.S. Court of Customs and Patent Appeals

EUGENE F. SCHWARZENBEK AND JOHN TURKEVICH *v.* BERNARD L. EVERING, JOHN R. COLEY, AND WILLIAM A. WILSON

No. 7490. Decided April 7, 1966

[53 CCPA —; 357 F.2d 1018; 149 USPQ 213]

1. INTERFERENCE—PRIORITY—THIRD PARTY INVENTORSHIP.

"An attempt to establish third party inventorship could avail Schwarzenbek et al. nothing in this proceeding since, as they concede in their brief, 'a party to an interference who is otherwise entitled to priority may not be defeated by his adversary on the basis of proof that the invention was in fact made by a third party, a stranger to the interference * * *.'"

2. SAME—DISCLAIMER.

"It is clear that neither Evering nor his co-inventors stated or intended to state that they did not invent the subject matter defined by the count. Rather, they and their assignee have continuously prosecuted the interference with the obvious goal of prevailing on priority and ultimately obtaining a claim corresponding to the count in a patent issuing on their application. Schwarzenbek et al., not having overcome the record date of Evering et al., cannot be adjudged prior inventors on the basis of actions or statements of the senior party which are neither a deliberate disclaimer of the entire subject matter defined by the count nor a clear averment that they are not the inventors of the subject matter so defined."

APPEAL from the Patent Office. Interference No. 89,674.

AFFIRMED.

John C. Quinlan, Arnold G. Gulko (*James W. Clement, Marylin Klosty, Max Dressler* of counsel) for appellants.

Arthur G. Gilkes, Edward B. Beale (*Malvin R. Mandelbaum, James H. Callahan, Douglas G. Brace* of counsel) for appellees.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

RICH, *Acting Chief Judge*, delivered the opinion of the court.

This appeal is from the decision of the Board of Patent Interferences awarding priority of invention in Interference No. 89,674 to Evering, Coley and Wilson, hereinafter Evering et al.

The interference involves an application of Evering et al., entitled "Oxidative Reactivation of Platinum Hydroforming Catalysts," Serial No. 601,073, filed July 30, 1956, as a continuation-in-part of application Serial No. 292,294, filed June 7, 1952. Schwarzenbek and Turkevich, hereinafter Schwarzenbek et al., are involved on their application for "Reaction of Platinum and/or Palladium Catalysts," Serial No. 294,707, filed June 20, 1952. Evering et al. are senior party as the result of the Examiner having granted a motion to shift the burden of proof on the basis of the filing date of their parent application. The Evering et al. applications are assigned to Standard Oil Company (Indiana), hereinafter Standard, and the Schwarzenbek application to M. W. Kellogg Company,[1] hereinafter Kellogg.

The invention in issue relates to hydroforming, the process of converting petroleum naphthas, in a stream of added hydrogen in the presence of a catalyst at elevated temperature, to high octane gasoline or aromatic hydrocarbons through dehydrogenation and aromatization of the naphthas. One catalyst used in hydroforming comprises small amounts of platinum on alumina. Although such platinum-alumina catalysts tend to become temporarily deactivated by the deposition of carbonaceous material thereon during hydroforming, it has been found that the catalyst can be regenerated to restore its activity by oxidation with a diluted air stream at an elevated temperature to remove the carbonaceous material. In certain cases, as stated in the Schwarzenbek et al. application, the platinum-alumina catalysts "can be used for prolonged periods of time, including many regenerations with a diluted air stream and at an elevated temperature, before the activity of the catalyst for a specific reaction or process declines permanently." By the process of the invention, one reactivates a platinum-alumina catalyst whose activity has so declined by subjecting it

[1] On January 1, 1963, this company became, by merger, a division of Pullman Incorporated.

to a first oxidative treatment for a period under a first set of conditions and then subjecting it to a second oxidative treatment under more severe oxidizing conditions.

The single count in issue, separated into numbered parts and with added emphasis for convenience in making future reference thereto, is reproduced below:

(1) A method of treating a deactivated, carbon-containing, platinum-alumina, hydroforming catalyst which has been subjected to *many* regenerations with a dilute air stream and has gradually accumulated residual carbon whereby its activity is impaired,

(2) which method comprises subjecting said deactivated catalyst to a first oxidative treatment at a temperature in the range of about 750 to 900° F. with a gas mixture containing more than about 0.5 and less than about 10 percent of oxygen for a period of time sufficient to remove readily combustible carbon, and then subjecting the catalyst to a second oxidative treatment with a gas mixture containing free oxygen under more severe oxidizing conditions than are employed in the first oxidative treatment, said second oxidative treatment being at a carbon-burning temperature not substantially higher than 925° F.

(3) for a period of time of at least about 15 minutes and sufficient to remove substantially all residual carbon and thereby to restore substantially the catalytic properties of the catalyst.

Neither party took priority testimony. However, Schwarzenbek et al. offered evidence including depositions of the applicants Evering, Coley and Wilson and certain other Standard employees and also exhibits from the records of Standard and its employees. The evidence relates to activities at Standard in connection with reactivation of platinum-alumina hydroforming catalysts, including the prosecution of certain patent applications.

Before the Board, Schwarzenbek et al. apparently questioned the finding of support for the count in the Evering et al. parent application which resulted in the granting of the motion to shift the burden of proof. They were not successful on that issue, however, and now expressly state that they do not argue it before this court.

The sole issue that remains is whether Evering et al. have "disclaimed" the invention in issue and as a consequence are not entitled to prevail in the interference, as they have. In their brief, Schwarzenbek et al. summarize their position as follows:

• • • because of *disclaimers* made by appellees in their sworn oral testimony in the proceeding below, appellees do not belong in this interference at all, and are thus not entitled to prevail here on the basis of the filing date of *either* their parent or their continuation-in-part application.

In particular, Schwarzenbek et al. rely on oral testimony of Evering et al. as constituting a disclaimer. They point out that their counsel read the portion of the count beginning with "subjecting said deactivated catalyst to a first oxidative treatment" and extending to the end (see parts (2) and (3) above) and then elicited the following testimony.

Q922. Dr. Evering, did you and Coley and Wilson discover the method described by the words which I have just read? A. No.

Schwarzenbek et al. also urge that Evering "deliberately and expressly disclaimed the *entire preamble of the count apart from the single word 'many,'*" relying on the following testimony elicited by their counsel:

Q925. Dr. Evering, in your view, did you and Coley and Wilson invent: "A method of treating a deactivated carbon-containing platinum-alumina, hydroforming catalyst which has been subjected to regeneration with a dilute air stream and has gradually accumulated residual carbon whereby its activity is impaired ... ."?

To help you in answering that question I call your attention to the fact that I read it largely from the first five lines of Schwarzenbek Deposition Exhibit 3 and omitted to read the word "many." A. Will you read me the question again, please.

Q925. (Read by the reporter.)

By the WITNESS:

A. No, but if there are not "many" regenerations, it is hard for me to say how a gradually accumulated residual carbon can be built up on the catalyst.

Topping that testimony of Evering with the contention that the preamble, including particularly the word "many," has no effect on the method of the count, Schwarzenbek et al. reach the conclusion that Evering's testimony constitutes a disclaimer of the entire count.

In their brief, Schwarzenbek et al. discuss at length the evidence of activities of other Standard workers, including particularly Schmitkons and Shields, who worked on reactivation of platinum-alumina catalysts during approximately the same period as Evering et al. and filed a patent application on that subject on the same date the parent Evering et al. application was filed. They also discuss the file histories of the concurrently filed applications, including action and comments before the Patent Office in response to a Patent Office requirement that a line of division be maintained between the subject matter claimed in the two applications.[2] Schwarzenbek et al. seem to imply that the aforementioned evidence leaves a question whether Schmitkons and Shields were not the inventors of the subject matter in issue instead of Evering et al. However, they state that third party inventorship is not being raised [3] and that reference has been made to the work of Schmitkons and Shields merely to help refresh the recollection of Evering et al. as to what they considered the gist of their invention and to "help show that Dr. Evering's sworn disclaimer in his oral testimony was *no precipitate, poorly thought out or inadvertent statement*, but an act as deliberate and knowing as it could possibly be."

The Board found there was neither an implied nor an express disclaimer of the count, resulting in Evering et al. being adjudged prior inventors on the basis of the filing date of their parent application. After discussing the evidence relating to the activities and application of Schmitkons and Shields, to statements made by counsel which emphasized the significance of carbon contents of the catalyst not set out in the count in distinguishing the invention of the parent Evering et al. application from that claimed by Schmitkons and Shields, and to testimony of Evering and his co-applicant Coley confirming some of counsel's statements, the Board stated:

It is our opinion that a disclaimer cannot be inferred from statements or testimony with respect to some different process or about some other matter. In other words, a disclaimer of the process of the count cannot, in our view, be made inadvertently. We believe that a disclaimer on the part of Evering et al. would require a clear statement or averment by them or on their behalf which relates directly to the count of this interference. It is our opinion that this is

[2] One point of Schwarzenbek et al. is that particular carbon contents of the catalyst disclosed in the Evering et al. application, but not set out in the present count, were relied on as distinguishing the invention thereof from that of Schmitkons and Shields.

[3] An attempt to establish third party inventorship could avail Schwarzenbek et al. nothing in this proceeding since, as they concede in their brief, "a party to an interference who is otherwise entitled to priority may not be defeated by his adversary on the basis of proof that the invention was in fact made by a third party, a stranger to the interference • • •." Also see *Foster* v. *Antisdel*, 14 App. D.C. 552, *Mortsell* v. *Laurila*, 49 CCPA 1028, 301 F.2d 947, 133 USPQ 380.

the minimum that would be required in order that the holdings in *Oliver* v. *Felbel* [20 App. D.C. 255, 1902 C.D. 565] and *Townsend* v. *Corey* [1905 C.D. 548] be applied here. In the absence of any direct statement about the process *as fully defined in the count* we find no basis in the evidence of a disclaimer of the count by Evering et al. In the old classical theory of a patentable combination, all of the elements, alone or separately, were presumed to be old. Obviously, an inventor could disclaim each element separately, while still asserting his right to claim the combination.

With respect to the charge that there has been an express disclaimer, the Board further commented:

The record indicates that Evering et al. contemplate that their invention includes subjecting a deactivated carbon-containing catalyst to the recited two stage oxidation only after the catalyst has undergone a number of cycles of hydroforming and mild oxidative treatment so that some refractory, hard to remove carbon has accumulated thereon. It is clear from the answers given by Evering to questions 923 to 926 * * * that subjecting the catalyst first to a number of cycles of hydroforming and mild regeneration is essential to the Evering et al. invention and that Evering et al. consider such a process distinctly different from a process which involves merely subjecting a deactivated hydroforming catalyst to simple two stage oxidation. It is quite evident to us that Evering, when he denied that Evering et al. had invented the broad two step oxidative catalyst reactivation method, had no intention of disclaiming the method of the count of interference. In this respect the situation here is similar to that in *Fishburn et al.* v. *Vincent*, 24 CCPA 1079, 33 USPQ 156, 88 F.2d 711, cited by Evering et al., where the court held that the appellee (Vincent) had no intention of disclaiming the count and that the situation there differed from situations "which involved an unqualified disclaimer of the invention set forth in the counts."

We have carefully considered the testimony and exhibits offered in evidence and we fail to find therein any deliberate and unequivocal disclaimer of the *method of the count of interference*. The testimony alleged by Schwarzenbek et al. to constitute the disclaimer by Evering et al., does not relate directly to the method as defined in the count, but to a method which is substantially different therefrom. As we pointed out above, we are of the opinion that a disclaimer of the subject matter of the count cannot be inferred by statements made with respect to other and different methods, particularly where it is evident that no such disclaimer was intended.

We find no error in the Board's position. While the argument of Schwarzenbek et al. here emphasizes the testimony of Evering as constituting a disclaimer, with the other evidence relating to prosecution history of the patent applications and the activities of Schmitkons and Shields as supporting circumstances, the reasoning of the Board clearly demonstrates the invalidity of that argument. [2] It is clear that neither Evering nor his co-inventors stated or intended to state that they did not invent the subject matter defined by the count. Rather, they and their assignee have continuously prosecuted the interference with the obvious goal of prevailing on priority and ultimately obtaining a claim corresponding to the count in a patent issuing on their application. Schwarzenbek et al., not having overcome the record date of Evering et al., cannot be adjudged prior inventors on the basis of actions or statements of the senior party which are neither a deliberate disclaimer of the entire subject matter defined by the count nor a clear averment that they are not the inventors of the subject matter so defined.

The cases of *Oliver* v. *Felbel* (C.A., D.C. 1902), 20 App. D.C. 255, 1902 C.D. 565, and *Townsend* v. *Corey* (Comm'r. Pat. 1905), 1905 C.D. 548, are relied on by Schwarzenbek et al. here as they were before the Board. Those cases may be precedent for awarding priority of

invention, in appropriate circumstances, to the opponent of a party who does actually disclaim the subject matter of an interference.[1] However, they so differ factually from the present case that they furnish no reason for finding that there has been a disclaimer of the count in issue here. Thus, the basis for the court's finding of a disclaimer in the *Oliver* case was a deliberate negative answer by Oliver to the following question deliberately propounded to him by his own counsel during the taking of testimony:

Do you claim to be the inventor of a device or mechanism embracing the particular combination of parts or elements specified in the issue of interference, as you understand them?

In *Townsend*, the Commissioner of Patents ruled that judgment was properly awarded to the opponent of a party who stated in a signed stipulation that he "does not claim to be the inventor of the subject matter of the interference issue." Moreover, it seems clear that in both of the cited cases the interest of the party making the disclaimer was in preventing his opponent from obtaining the subject matter in issue rather than in getting it himself.

The Board additionally considered the question of the weight to be given the word "many" in the introductory part of the count. Citing *Kropa* v. *Robie*, 38 CCPA 858, 187 F.2d 150, 88 USPQ 478, it concluded that the introductory phrase of the count including "many" is necessary to the definition of the process of the count. While we find no error in that conclusion, we think a separate ruling on the significance of the word "many" is unnecessary to the determination of the present controversy. Our finding that Evering et al. did not intend to disclaim *the subject matter defined in the count* and did not make a clear statement of disclaimer of *that subject matter* is enough to compel affirmance of the award of priority to them.

The decision is affirmed.

AFFIRMED.

U.S. Court of Customs and Patent Appeals

IN RE BURTON B. SANDIFORD

No. 7628. Decided April 14, 1966

[53 CCPA —; 358 F.2d 756; 149 USPQ 301]

1. PATENTABILITY—OBVIOUSNESS—RELATIVE STABILITY OF NON-IONIC AND IONIC SUBSTANCES.

"Appellant asserts discovery of the unexpected superiority of HEC for water flooding by reason of its stability in oil field brines. The Solicitor counters, effectively we think, that the art knew that solutions of HEC, being non-ionic, were generally more stable in the presence of salts and acids than those utilizing CMC, the latter being an anionic thickener."

2. SAME—PARTICULAR SUBJECT MATTER—"WATER FLOODING."

The decision of the Board of Appeals, refusing certain claims in an application entitled "Water Flooding" as unpatentable over the prior art, is affirmed as to some of the claims and reversed as to the others.

APPEAL from the Patent Office. Serial No. 32,550.

MODIFIED.

Sol Shappirio, *Robert E. Strauss* for appellant.

Joseph Schimmel (*L. F. Parker* of counsel) for the Commissioner of Patents.

---

[1] It is noted that Rule 262 of the Rules of Practice of the Patent Office provides for judgment against a party to an interference who files a written disclaimer of the invention in issue "with the written consent of the assignee when there has been an assignment."

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and Judge WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

ALMOND, *J.*, delivered the opinion of the court.

Burton B. Sandiford appeals from the decision of the Board of Appeals affirming the rejection of method claims 1 to 6, inclusive, of appellant's application,[1] entitled "Water Flooding," as unpatentable over the prior art under 35 U.S.C. 103. No claims have been allowed.

The claimed invention relates to an improvement in the viscous water flooding method for displacing oil from a subterranean oil-bearing reservoir in the process of secondary petroleum recovery. It appears that reliance cannot be had on natural forces and pumping to induce the residual oil to the withdrawal well but resort must be had to other means to accomplish this desired end. A conventional method is to inject water or brine into the reservoir to force the oil contained therein towards a production well. This method, it seems, does not obviate the difficulty which is experienced in bringing about a complete areal sweep of the water which has a natural inclination to penetrate directly toward the withdrawal well in a narrow channel. It was found expedient, therefore, to increase the viscosity of the water or brine by adding certain materials thereto designed to reduce the tendency of the water to channel in the reservoir and thereby improve the displacement process and the ultimate recovery of the oil. The claims on appeal cover the use of, allegedly, a new additive for this purpose, namely, hydroxyethyl cellulose (HEC), as well as a new modification of the method of using it.

In addition to the viscous nature of HEC in aqueous solutions, the application states that it exhibits other characteristics which make it valuable in reservoir flood waters. Among these are: (1) inertness to sands and non-adsorption thereon; (2) does not cause plugging of sands; (3) relative stability in oil field substances containing detrimental chemical reacting agents; (4) stability under turbulence and agitation, and (5) a beneficial viscosity-shear relationship, namely, "high viscosities under low shear rates such as are encountered at the oil-water interface in a flooding process, and * * * lower viscosities under high shear rates * * * at the injection sites."

Claim 1 is reproduced as representative:

1. In the method of recovering oil from a subterranean oil bearing reservoir wherein an aqueous fluid is injected into said reservoir through at least one injection well and displaced oil is withdrawn from said reservoir through at least one production well spaced therefrom, the improvement which comprises employing as said aqueous fluid a viscous aqueous solution of hydroxyethyl cellulose having a viscosity at 75° F. between about 10 and 1000 centipoises.

The references are:

Binder et al. (Binder), 2,731,414, January 17, 1956.
Cardwell et al. (Cardwell), 2,778,427, January 22, 1957.
Sandiford et al. (Sandiford), 2,827,964, March 25, 1958.
Park, 2,961,400, November 22, 1960.

Binder discloses the basic concept of using viscosity increasing agents as thickeners for the same purpose disclosed by appellant. The agent is added to a portion of the flood water and the resulting solution (having a volume of about 0.05 to 0.3 times the pore volume of the reservoir to be flooded) is injected into the reservoir, and thereafter the unthickened, relatively nonviscous flood water is injected into the well whereby the oil in the formation is displaced by the viscous aqueous solution which in turn is displaced by the unthickened water.

Binder does not mention HEC as such. Among the thickening agents disclosed is carboxy methyl cellulose (CMC), 1 to 2 percent of which will serve to increase viscosity to about 1000 centipoises. The amount of viscous solution used should be about 0.05 to 0.30 of the volume of hydrocarbon pore space in the reservoir.

Cardwell relates to a method of acidizing an earth formation penetrated by the bore of the well to increase the output of oil and gas therefrom. The patent teaches the use of water-soluble cellulose ethers as viscosity increasing agents for dilute aqueous solutions used in oil well acidization and fracturing. Cellulose ethers disclosed for this purpose are, inter alia, CMC and HEC. The patentee states that by including in the hydrochloric acid solution the cellulose ethers in a stated percentage range by weight, they "at least temporarily thicken or increase the viscosity of the acid solution and deposit a water absorbent gel-like film or coating on the surface of the earth formation to be acidized."

Sandiford relates to the use of thickening agents in water flooding processes. It is disclosed that brines are conventionally used as the aqueous flooding medium in such processes and the use of a surface active agent is also a conventional practice.

Park discloses the use of water-soluble cellulose ethers and esters for controlling clay swelling in water flooding and other well treating processes. This patent also teaches the use of brine as the flooding medium in a water flooding process. According to Park, swelling of the silicates in the reservoir can be inhibited by the addition of slight amounts (less than 0.1 weight percent) of a cellulose derivative to the water. Fourteen such derivatives are disclosed including both HEC and CMC. Relative to these derivatives as viscosity increasing agents for water, the patentee states that the operability of his process "is independent of the viscosity grade of the cellulose derivative employed. So long as the viscosity is not so great that the cellulose cannot be dispersed in the treating liquid, it may be used in the invention."

The Examiner rejected the claims as "lacking invention" over Binder in view of the Cardwell and Park patents. He pointed out that Binder disclosed the basic concept of utilizing viscosity increasing agents in water flooding processes, for which purpose CMC is specifically disclosed. He further noted that both Cardwell and Park teach the similarity and equivalence of HEC and CMC and that these cellulosic ether derivatives are viscosity increasing agents, concluding that it would be an obvious expedient to one skilled in the art with the teachings of these references before him to substitute HEC for the CMC thickener in water flooding processes such as disclosed by Binder. With reference to the limitation in claim 3 reciting "oil field brine" as the flooding medium, the Examiner regarded such use of this substance as a conventional practice in the art as taught by both Sandiford and Park. As to claim 6 which broadly calls for "a surface active agent," included in the flooding medium, the Examiner observed that this is a common practice in the art as shown by Sandiford.

[1] Serial No. 32,550, filed May 31, 1960.

In its affirmance of the Examiner's decision, the Board stated:

> We agree with the Examiner that the secondary references would suggest the use of hydroxyethyl cellulose in place of the carboxymethyl cellulose employed in the process of Binder et al. * * *

It is apparent that both the method claimed by appellant and that disclosed by Binder relate directly to improved secondary methods of recovering oil from a subterranean reservoir. Both employ the steps of injecting a viscous aqueous cellulosic solution (appellant about 10 to 1000 centipoises, Binder 100 to 1000 centipoises) into the oil bearing reservoir through injection wells until about .001 to 0.30 (Binder .05 to 0.30) times the pore volume to be flooded is injected.

It may be said, therefore, that appealed claims 1 and 2 distinguish over Binder only in that they call for the use of HEC instead of CMC as an aqueous solution viscous additive. We think that the record amply sustains the holdings below that this difference would be obvious from the prior art. Cardwell teaches the use of HEC and CMC to increase the viscosity of the acid solution employed in his secondary oil recovery technique. Park, which relates to the control of swelling of silicates in secondary oil recovery, discloses the use of CMC and HEC as viscosity increasing agents for water. Park refers to the High Polymers Text,[2] which reads:

> Sodium carboxymethyl cellulose thickens water solutions without precipitation over a pH range of 4 to 12 and does not gel from water solutions upon heating. It is not precipitated from solution by dilute solutions of salts of alkali or alkaline earth metals; it is precipitated from solution by strong acids, by salts of amphoteric multivalent metals, and by salts of heavy metals.

Under the caption "Hydroxyethyl Cellulose," it is further stated:

> The use of hydroxymethyl cellulose result[s] from its solubility in cold and hot water, its salt and solvent compatibility, and its effectiveness as a protective colloid. Hydroxyethyl cellulose thickens solutions over a wide range of pH without precipitation.

It seems apparent therefore that those skilled in the subject art were fully apprised that both HEC and CMC could be used as solution thickeners over a wide range of pH values without precipitation.

Of equal obviousness is the use of brine (claim 3) as an aqueous liquid in water flooding, taught by Park. The same conclusion follows that a surface active agent (claim 6) as an additive to an aqueous solution could be used, as taught by Cardwell.

[1] Appellant asserts discovery of the unexpected superiority of HEC for water flooding by reason of its stability in oil field brines. The Solicitor counters, effectively we think, that the art knew that solutions of HEC, being non-ionic, were generally more stable in the presence of salts and acids than those utilizing CMC, the latter being an anionic thickener.

With regard to the use of HEC, the main thrust of appellant's argument is that although HEC and CMC are chemical derivatives of cellulose, they are not obvious equivalents as viscous additives in water flooding because of chemical differences which make HEC a superior additive. Appellant seeks to support these contentions by reliance upon several tests and affidavits purporting to establish lack of equivalency between the two derivatives and the superiority of HEC over CMC.

The Examiner pointed out that an affidavit in order to prove inoperativeness of a patented invention must make a strong and conclusive showing and deemed the limited showing made by appellant insufficient to establish that CMC, claimed as being useful in water flooding in Binder, is inoperative for this purpose. The record supports the observation of the Solicitor that the core used by appellant was saturated with brine prior to the introduction of the oil, a condition not called for by the claims. There is no test establishing that sand cores not so saturated would be plugged when flooded by a viscous aqueous solution of CMC. The disclosures of the prior art clearly indicate that they would not be.

We have heretofore noted the prior art's recognition of the non-ionic nature of solutions of HEC and their superior characteristic of stability in the presence of salts and acids over CMC. This, we think, would clearly suggest to one skilled in the art to use HEC in place of CMC in a core such as used by appellant in his tests.

Claims 4 and 5 specify that one or more thickened HEC solutions having successively decreasing viscosities are injected after the injection of the first thickened HEC solution. The purpose of this gradual viscosity decrease is stated in the specification:

> To avoid any sharp demarcations in viscosity which could adversely affect the relative mobilities and cause channelling, the addition of hydroxyethyl cellulose can gradually be lessened through a series of incremental decreases rather than discontinuing the addition abruptly. In this manner, water present in the flooded interval is always adjacent water of approximately equal viscosity and the tendency of the less viscous water to channel into through [sic] more viscous water is substantially eliminated. * * *

With regard to the above limitation in claims 4 and 5, the Examiner remarked:

> If this gradual lowering of viscosity were considered to be an advantage, it would be obvious to one skilled in the art to gradually lessen the quantity of the HEC in this manner. Appellant has not shown that there is in fact any actual advantage in following the flood-front with aqueous media of gradually reduced viscosity (as set forth in claims 4 and 5) as opposed to the follow-up with flood water containing no thickener as shown by Binder et al. Appellant has not even alleged that the particular procedure of claims 4 and 5 produces any unobvious advantages.

We cannot agree with the Examiner. First, we believe the rejection is based upon faulty reasoning. The prior art neither teaches nor suggests gradually decreasing the viscosity of the following liquid. Binder merely discloses following the initial viscous injection with unthickened water. Any suggestion for the gradual decrease must have originated with appellant's specification, not the prior art. It is, of course, improper to utilize appellant's own teachings to reject claims under the guise of 35 U.S.C. 103. Second, appellant does disclose an advantage to be gained by the gradual decrease—the inhibition or elimination of channeling. We see no reason to doubt this allegation.

[2] For the reasons above stated, we affirm the Board's decision as to claims 1–3, and 6, and reverse the Board's decision as to claims 4 and 5.

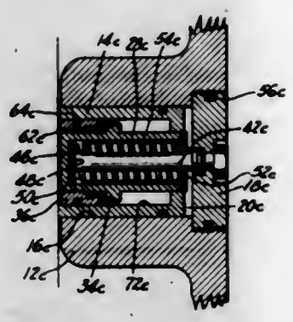
REISSUES

SEPTEMBER 20, 1966



Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

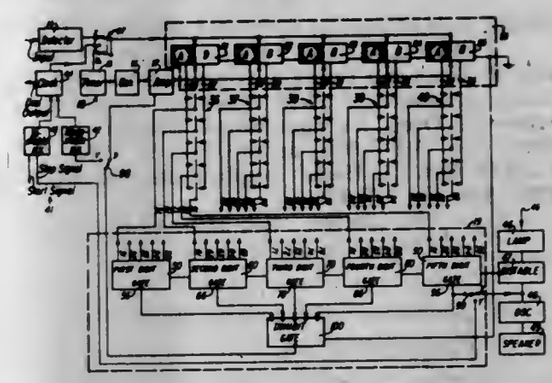
26,078
COMBINATION ADJUSTER AND RESET MECHANISM

James A. Tankersley and Paul A. Driscoll, South Bend, Ind.; said Tankersley assignor to The Bendix Corporation, a corporation of Delaware

Original No. 3,095,064, dated June 25, 1963, Ser. No. 572,855, Mar. 21, 1956. Application for reissue June 26, 1964, Ser. No. 390,254

14 Claims. (Cl. 188—72)

10. In a brake or the like: a cylinder housing having a bore therein; a piston, reciprocably slidable in a forward actuating direction and a rearward retraction direction, located in said bore; said piston having a rear face, an opening in said rear face, and a bore terminating at said opening in said rear face; an element gripping the wall of said piston bore; a member fixedly secured to said housing at a location opposite said piston bore and extending in a forward direction from said housing; said element being slidable relative to said member; a lost motion stop connection between said member and said element when said element is moved forwardly; whereby upon movement of said piston in a forward direction, said piston and element will move as a unit until said element is stopped by said lost motion stop connection and upon further forward movement of said piston, said gripping connection between said element and piston will be overcome and said piston will move forwardly relative to said element and be gripped thereby at a new position thereon; and resilient means operatively connected to said element and said member reacting on said member to provide a retraction force on said element and piston as a unit after actuation of said piston.



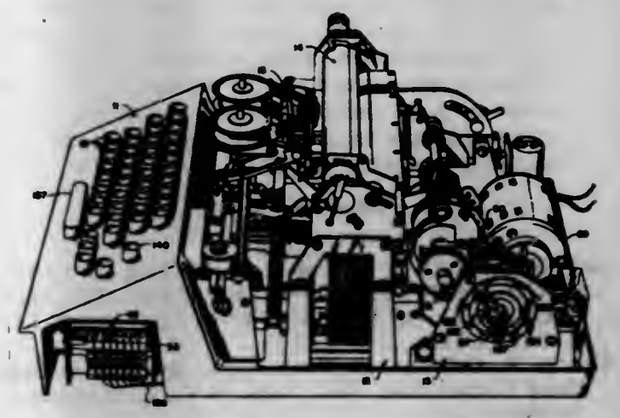
26,079
SELECTIVE CALLING APPARATUS

Martin Cooper, Skokie, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Original No. 3,080,547, dated Mar. 5, 1963, Ser. No. 771,641, Nov. 3, 1958. Application for reissue May 5, 1964, Ser. No. 375,688

12 Claims. (Cl. 340—164)

1. An electronic selector device for providing selective response to a call signal which includes pulse information representing the digits of a code call associated with the device, and for generating such call signal for transmission, said selector device including in combination, a binary counter circuit for counting the pulse information of the call signal, a plurality of gates selectively connected to said counter circuit, said counter circuit actuating said gates in sequential order when the output therefrom corresponds to the count of the first digit and then to the sum of the first digit and the succeeding digits of the call signal in order, decoding control circuit means for controlling said counter circuit and said gates in a decoding mode to provide selective response to the call signal, encoding control circuit means for operating said

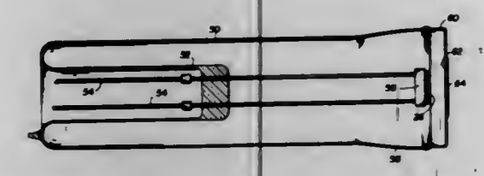


counter circuit and said gates in an encoding mode for generating the call signal for transmission, and means for selectively conditioning said decoding control circuit means and said encoding control circuit means.

26,080
TELEGRAPH TRANSMITTER DISTRIBUTOR STARTING MECHANISM

Arthur A. Hagstrom, Roselle, Ill., assignor to Teletype Corporation, Skokie, Ill., a corporation of Delaware

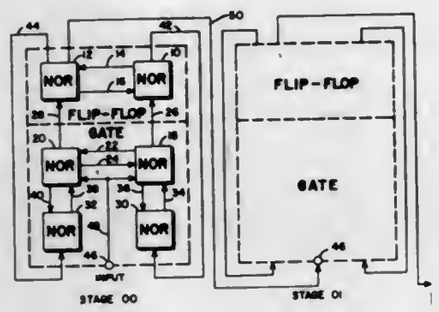
Original No. 3,133,988, dated May 19, 1964, Ser. No. 159,240, Dec. 14, 1961. Application for reissue Feb. 3, 1966, Ser. No. 532,506



9 Claims. (Cl. 178—17)

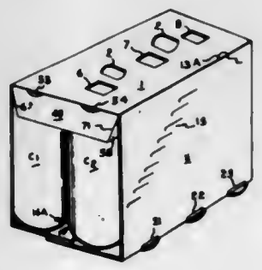
9. In a key controlled telegraph transmitter having a plurality of permutatively settable members, keys for actuating said members and contacts controlled by said members, a cyclically operable distributor having serializing elements connected to said contacts, a universal control member operated by said keys each time any one of them is operated, and means actuated by said universal control member for initiating a single cycle of operation of said distributor each time a key is operated comprising a pivot rod, a trip lever oscillatable on said pivot rod by said universal control member, an intermediate lever oscillatably, and slidably mounted on said pivot rod for oscillation by said trip lever, a blocking lever oscillatable about said pivot rod from a blocking position to a non-blocking position by said intermediate lever, a distributor-

start lever normally blocked by said blocking lever and operable to initiate a cycle of operation of said distributor when the blocking lever is moved to the non-blocking position, means on said intermediate lever for engagement by said trip lever to oscillate the intermediate lever and for engagement by the distributor-start lever to slide the intermediate lever out of position to be oscillated, and spring means to oscillate the intermediate lever to position to release said blocking lever for movement back to blocking position.



26,081
SHORT PULSE-HIGH ENERGY FIELD EMISSION TYPE ELECTRON RADIATION TUBE
Walter P. Dyke and Frank J. Grundhauser, McMinnville, Oreg., assignors to Field Emission Corporation, McMinnville, Oreg., a corporation of Oregon
Original No. 3,173,006, dated Mar. 9, 1965, Ser. No. 232,021, Oct. 22, 1962. Application for reissue July 2, 1965, Ser. No. 472,078
20 Claims. (Cl. 250—49.5)

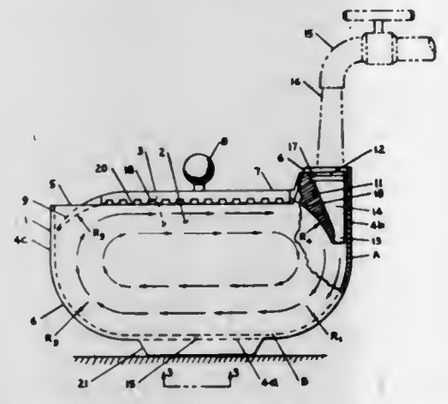
1. An electron radiation device comprising envelope means having a vacuum therein,
an anode structure forming part of said envelope means, said anode structure having a thin metallic wall portion capable of being penetrated by high speed electrons,
electron emitting means supported in said envelope means including a field emission cathode for directing electrons toward said wall portion when a high voltage pulse is applied between said anode and said cathode,
means for supporting material to be subjected to electron radiation adjacent and on the other side of said wall portion from said electron emitting means,
an electrical connecting means for said electron emitting means and said anode structure to enable high voltage, high current electric discharges to be produced between said electron emitting means and said anode structure to cause electrons to penetrate said wall and into said material.



26,082
ASYNCHRONOUS BINARY COUNTER REGISTER STAGE WITH FLIP-FLOP AND GATE UTILIZING PLURALITY OF INTERCONNECTED (NOR) LOGIC CIRCUITS
George T. Osborne, St. Paul, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Original No. 3,139,540, dated June 30, 1964, Ser. No. 226,524, Sept. 27, 1962. Application for reissue June 4, 1965, Ser. No. 462,787
11 Claims. (Cl. 307—88.5)

5. A bistable register stage comprising:
a bistable flip-flop circuit alternatively switchable to a set and clear operating condition, said flip-flop including a first pair of cross-coupled logic circuits, a set input circuit, a clear input circuit, a set output circuit, and a clear output circuit;
a gating circuit for controlling the switching of said flip-flop, said gating circuit including a second pair of cross-coupled logic circuits, an output circuit of one of said second pair coupled to said clear input circuit and an output circuit of the other of said second pair coupled to said set input circuit;
a third pair of logic circuits, each circuit of said third pair having input and output circuits, one of said third pair cross-coupled with one of said second pair and the other of said third pair cross-coupled with the other of the second pair;

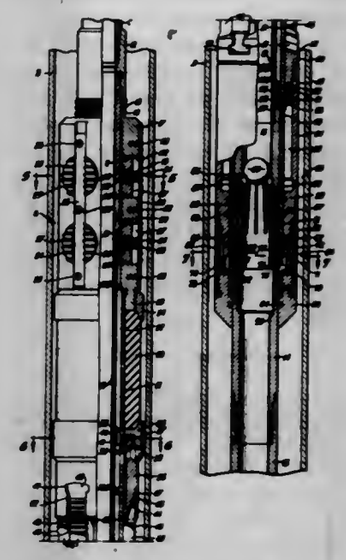
means coupling said clear output circuit to an input circuit of the one of said third pair;
means coupling said set output circuit to an input circuit of the other of said third pair; and
means for receiving input signals coupled to an input circuit of each of said second pair.



26,083
ARTICLE CARRIER
Homer W. Forrer, Jonesboro, Ga., assignor to The Mead Corporation, a corporation of Ohio
Original No. 3,203,584, dated Aug. 31, 1965, Ser. No. 221,565, Sept. 5, 1962. Application for reissue Jan. 24, 1966, Ser. No. 526,952
2 Claims. (Cl. 220—115)

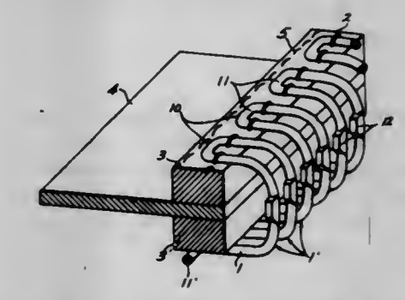
1. A package comprising two rows of cylindrical objects arranged in close parallel relation to each other, the objects having chimed ends, a rectangular main wall disposed in flat parallel relation to the ends of the objects, said main wall being slightly wider than twice the diameter of the objects including their chimes, a pair of [rectangular] side walls foldably joined respectively along opposite side edges of said main wall and adjacent the sides of the objects, a pair of lap panels having their side edges foldably joined respectively to the edges of said side walls remote from said main wall and extending in flat parallel relation to the ends of the objects remote from said main wall, means securing said lap panels together to form a composite wall of a width slightly less than said main wall, an anchor panel foldably joined to each end edge of each side wall, said anchor panels being at least as wide as the radii of the objects and being folded flat against the inside of said side walls, an end panel foldably joined to each end of said main panel and disposed in normal relation to said main panel and adjacent the sides of the objects, a pair of slots formed in the fold line between each end panel and said main panel, each slot corresponding to one row of objects and being arranged to receive the chime of the end can in one row of objects, a generally

triangular web panel foldably joined to each end of each end panel and to the adjacent end of the adjacent anchor panel and with the vertex of said web panel at the adjacent corner of said main panel, the anchoring angle (A) defined by the fold line between each anchor panel and the adjacent web panel and by the fold line between each anchor panel and the adjacent side wall being substantially greater than forty-five (45) degrees and the web angle (W) defined by the fold line between each web and the adjacent anchor panel and by each web and the adjacent end panel being slightly greater than said anchoring angle, and a plurality of chime receiving slots formed along the fold lines between each lap panel and the associated side wall.



26,084
FRUIT AND VEGETABLE WASHING DEVICE WITH VERTICAL CIRCULATIVE FLOW AND RIBBED COVER
Charles W. Ranson, 7906 Agnew Ave., Los Angeles, Calif. 90045
Original No. 3,207,482, dated Sept. 21, 1965, Ser. No. 249,894, Jan. 7, 1963. Application for reissue Nov. 29, 1965, Ser. No. 514,760
11 Claims. (Cl. 259—4)

1. A washing device including two side walls extending longitudinally and vertically and spaced apart, a lateral wall extending between said side walls to provide a bottom wall and two opposite end walls and connecting with said side walls in unitary relation, and the inner surface of said bottom wall and the inner surface of at least one of said end walls substantially faired to provide a substantially curved inner surface at the region of juncture, and said walls *substantially* terminating upwardly to provide an upper opening, and a cover member adapted for said opening, and a plurality of channels in said cover member from the inner surface thereof, and with said cover member in normal installed position said channels *substantially* traversing container wall edges *to provide for liquid exhaust flow while preventing the egress of small wash units.*



26,085
HYDRAULICALLY ACTUATED WELL PACKERS
William D. Myers, Houston, Tex., assignor to Baker Oil Tools, Inc., Los Angeles, Calif., a corporation of California
Original No. 3,112,796, dated Dec. 3, 1963, Ser. No. 99,598, Mar. 30, 1961. Application for reissue Aug. 20, 1965, Ser. No. 482,660
22 Claims. (Cl. 166—120)

1. In apparatus adapted to be set in a well bore: a body; normally retracted means disposed about said body and adapted to be expanded outwardly into engagement with the wall of the well bore; upper actuating means engaging an upper portion of said normally retracted means and comprising an upper setting sleeve surrounding said body; lower actuating means engaging a lower portion of said normally retracted means and comprising a lower setting sleeve; hydraulically operable means on said sleeves *movable toward each other* for shifting said upper and

lower actuating means relative to each other to expand said normally retracted means, said hydraulically operable means on each sleeve being slidable along the other sleeve; and means for enabling fluid pressure to act on said hydraulically operable means.

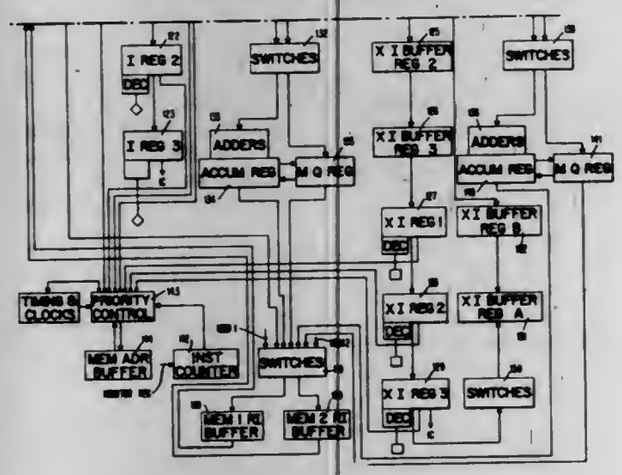
26,086
SLIDE FASTENERS
Josef Ruhrmann, Stuttgart-Vaihingen, Kurt Streicher, Echterdingen, near Stuttgart, and Ernst Popovitsch, Echterdingen, near Stuttgart-Bussnau, Germany, by Talon, Inc., Meadville, Pa., a corporation of Pennsylvania
Original No. 3,149,387, dated Sept. 22, 1964, Ser. No. 174,815, Feb. 21, 1962, which is a continuation of Ser. No. 714,801, Feb. 12, 1958, which in turn is a division of Ser. No. 617,336, Oct. 22, 1956. Application for reissue Oct. 22, 1965, Ser. No. 505,140
21 Claims. (Cl. 24—205.1)

1. A stringer for a slide fastener comprising a filamentary structure having a series of substantially U-shaped scoop portions arranged one behind the other substantially in parallel relation so as to provide two series of transverse portions disposed in juxtaposition with the transverse portions in each series being substantially parallel to one another,
the inner end of each of said transverse portions in each of said series being connected only to the inner end of a preceding transverse portion and, the inner end of each of the opposed transverse portions in the other series being connected only to a succeeding transverse portion so as to provide a series of substantially U-shaped [heel] portions,
each of said U-shaped portions having a substantially longitudinally extending base portion

an elongated tape arranged along one side of said transverse portions so that the scoop portions extend outwardly from the marginal edge of the tape,

the transverse portions of each series being located substantially in a common longitudinally extending plane *substantially parallel to said tape*, and with said [heel] base portions also being located substantially in a common longitudinally extending plane *located substantially perpendicular both to the plane of the tape and to the transverse portions*, and

means independent of said transverse portions for attaching the same solely in cooperation therewith to the marginal edge portion of the tape between said scoop portions and said heel portions of said filament so as to bind the filament and tape securely together at said transverse portions whereby the heel portions are exposed.



26,087

MULTI-COMPUTER SYSTEM INCLUDING MULTIPLEXED MEMORIES, LOOKAHEAD, AND ADDRESS INTERLEAVING FEATURES

Stephen W. Dunwell and Clarence Ernest Stephens, Poughkeepsie, William R. Stringfellow, Wappingers Falls, and Vaughn D. Winkler, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Original No. 3,202,969, dated Aug. 24, 1965, Ser. No. 862,967, Dec. 30, 1959. Application for reissue Nov. 26, 1965, Ser. No. 526,638

29 Claims. (Cl. 340—172.5)

19. A data word storage arrangement for an electronic digital computer machine, said data word storage arrangement comprising first and second separate multiple-word storage devices, both of said devices including a plurality of separate data word storage locations, common signal input/output connections for each of said storage devices, signal-controlled address selection means for rendering any chosen one of said word storage locations accessible through said input/output connections, address selection control means having an address signal input for receiving a digital form address number signal defining any chosen one of said data word storage locations in said storage arrangement and control signal outputs selectively energizable in accordance with the address number defined by the address signal applied to said address signal input, and circuit means interconnecting said control signal outputs of said address selection control means with said address selection means of said word storage devices to render a word storage location in said first multiple word storage device accessible through said input/output connections in response to a first address number signal to render a word location in said second multiple word storage device accessible through said input/output connection in response to a second address signal having an address number consecutive to the address number of said first address signal and to render a word storage location in said first multiple word storage device accessible through said input/output connection in response to a third address signal having an address number consecutive to the address number of said second address signal, said circuit means operative to render a multiple word storage device accessible before the completion of an access operation at a previously addressed multiple word storage device.

26,088

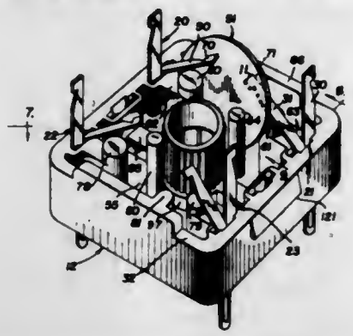
BEARING COMPOSITION

Robert Rulon-Miller and Saul Ricklin, Bristol, R.I., assignors to Dixon Corporation, a corporation of Rhode Island

No Drawing. Original No. 3,122,505, dated Feb. 25, 1964, Ser. No. 102,104, Apr. 11, 1961. Application for reissue Feb. 24, 1965, Ser. No. 452,039

46 Claims. (Cl. 252—12)

24. A composition of matter consisting essentially of a homogeneous mixture of the three components polytetrafluoroethylene present by volume of 50% to 80%, a silicate selected from the group consisting of glass, talc, mica and aluminum silicate and a third material selected from the group consisting of aluminum, molybdenum, silver, copper, lead, lead oxide and copper oxide, the silicate being present by volume in from equal parts to twice the third material, whereby the presence of the third material imparts increased wear resistance as compared with a two part mixture of polytetrafluoroethylene wherein the silicate or third material would be present in amount equal to the sum of the silicate and the third material in the three part mixture.



26,089

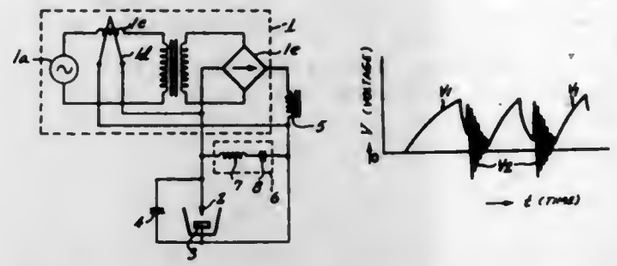
COUPLING DEVICE

John J. Antalek, Glenview, Ill., assignor, by mesne assignments, to Thompson Ramo Wooldridge Inc., Euclid, Ohio, a corporation of Ohio

Original No. 3,130,350, dated Apr. 21, 1964, Ser. No. 821,802, June 22, 1959. Application for reissue July 19, 1965, Ser. No. 478,014

6 Claims. (Cl. 317—101)

4. In combination, a base member of insulating material, a pair of slots extending through said base member, terminal members positioned in each of said slots, each of said terminal members having a bifurcated upper portion above said base member, one bifurcation of each of said terminal members extending inwardly towards the other terminal member, *means defining spaced apart positioning means on said base member*, and a disc capacitor having opposed electrodes separated by a layer of dielectric, *the end portions of* said extending [bifurcation] *bifurcations* being conductively bonded to opposite sides of said disc capacitor at points which are spaced apart laterally to exert a force couple on said disc capacitor [and resiliently urge the sides of said capacitor against said positioning members] *and resiliently urge said capacitor against said positioning means* so that said capacitor is held in a generally vertical plane.



26,090

[ELECTRIC POWER SUPPLY APPARATUS FOR ELECTRIC] *METHOD OF ELECTRICAL* DISCHARGE MACHINING

Kiyoshi Inoue, 182 3-chome Setagaya-ku, Tamagawayoga-machi, Tokyo-to, Japan

Original No. 3,087,044, dated Apr. 23, 1963, Ser. No. 52,395, Aug. 29, 1960. Application for reissue Apr. 23, 1965, Ser. No. 450,579

12 Claims. (Cl. 219—69)

11. The process of electrical discharge machining of a conductive workpiece across a dielectric filled gap by an electrode tool comprising the steps of passing a series of machining pulses of relatively low frequency and long duration across the gap, impressing a series of relatively high frequency, short duration pulses of successively diminishing amplitude across the gap prior to the normal completion of each machining pulse and terminating said higher frequency pulses prior to the initiation of the next following machining pulse, the time duration of each short duration pulses being a small fraction of that of said machining pulses.

26,091

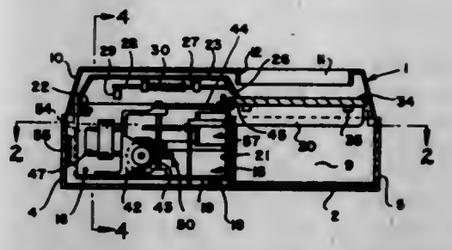
ULTRASONIC AMPLIFIERS, OSCILLATORS, CIRCULATORS, ISOLATORS AND SWITCHES

Donald L. White, Mendham, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Original No. 3,173,100, dated Mar. 9, 1965, Ser. No. 105,700, Apr. 26, 1961. Application for reissue Oct. 23, 1965, Ser. No. 505,145

13 Claims. (Cl. 331—96)

14. An oscillator comprising a unitary body having both piezoelectric and semiconductor properties, said body enclosed within a cavity adapted to support high frequency electromagnetic waves, means including a D.C. bias source for establishing a D.C. field in said body and for simultaneously generating an acoustic wave signal in said body with an accompanying significant piezoelectric field, said D.C. field having a magnitude and direction such that the drift velocity of the carriers responsive to said field has a velocity component along the axis defined by the direction of acoustic wave propagation whereby the carriers of said D.C. field interact with the said acoustic wave in a manner so as to modify the amplitude of the acoustic wave, and electrical output means for coupling electromagnetic energy from the said cavity.



26,092

SELF-CLEANING ASH TRAY

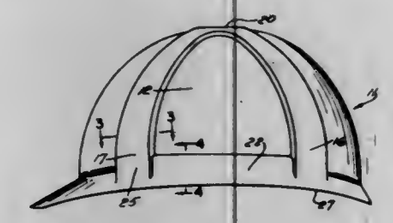
Archibald M. McKenzie, West Vancouver, British Columbia, Canada, assignor to Sherman Development Ltd., Vancouver, British Columbia, Canada, a corporation of British Columbia

Original No. 3,095,108, dated June 25, 1963, Ser. No. 135,917, Sept. 5, 1961. Application for reissue June 4, 1965, Ser. No. 461,569

12 Claims. (Cl. 220—20.5)

10. A self-cleaning ash tray comprising a casing having an opening, a plate associated with said casing for reciprocatory movement from an original position adjacent to and blocking said opening, to an open position unblocking said opening, a flexible wiper blade engaging the top surface of the plate adjacent a side edge thereof when said plate is in said original position and cleaning said plate when said plate moves from said original position to said open position, wiper blade cleaning means for causing the flexible wiper blade to vibrate and thereby clear the same of accumulated debris and actuator means operatively associated with the plate and the wiper blade cleaning means to actuate said wiper blade cleaning means at a predetermined position of the plate within the span of said reciprocatory movement.

PATENTS



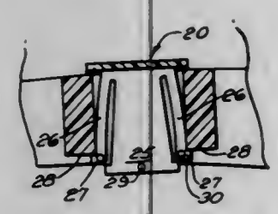
GRANTED SEPTEMBER 20, 1966

GENERAL AND MECHANICAL

3,273,162
HARD HAT WITH REINFORCING RIBS

John R. Andrews III, North Uxbridge, Mass., assignor to Welsh Manufacturing Company, a corporation of Rhode Island

Filed Dec. 3, 1964, Ser. No. 415,653
3 Claims. (Cl. 2—3)

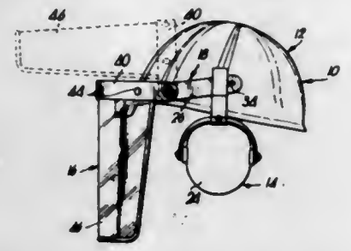


1. A molded hard hat having an arcuate crown portion and a outwardly flaring generally horizontal marginal lower edge, the thickness of the lower marginal edge being greater than the wall of the crown portion, said wall being outwardly deflected to provide ribs radiating from the mid top portion downwardly along the arcuate wall and extending into and across said marginal edge which is also outwardly deflected at the location of said ribs, said thicker lower edge extending from rib to rib providing a support against compression of adjacent ribs.

3,273,163
ACCESSORY ATTACHMENT TO A HARD HAT

John R. Andrews III, North Uxbridge, Mass., assignor to Welsh Manufacturing Company, a corporation of Rhode Island

Filed Dec. 18, 1964, Ser. No. 419,498
1 Claim. (Cl. 2—3)



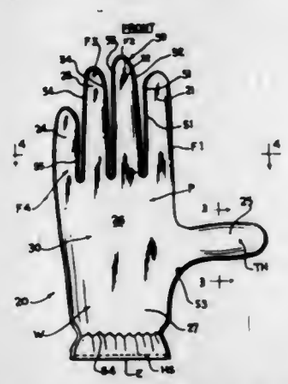
In combination with a hard hat, a member for attaching accessories thereto, means for detachably securing said member to said hat comprising two cooperating parts, one part on said hat and the other part on said member, said part on the hat being a socket having a through opening with outwardly extending abutments formed at its lower edges, and the part on said member being a tongue with resilient arms at either side having lugs extending outwardly a distance to engage the abutments of said socket and prevent withdrawal of said tongue, said arms and tongue being relatively spaced sufficiently to permit movement of the arms toward each other and toward said tongue to free said lugs from said abutments for withdrawal of the tongue from said socket.

3,273,164
FACE SHIELD ASSEMBLY FOR A HARD HAT

Robert R. Thomas, Kansas City, Mo., assignor to Parmelee Plastics Company, Kansas City, Mo., a corporation of Missouri

Filed Sept. 9, 1964, Ser. No. 395,197
7 Claims. (Cl. 2—10)

1. In a safety headgear comprising a hard hat having a visor, a pair of sound attenuators, means mounting an attenuator on each side of the hat, and a face shield, the combination with said headgear of:



bracket means secured to the attenuator mounting means and extending forwardly therefrom said bracket means including a U-shaped band comprising a pair of legs and a bight section integral with the legs and having an elongated slot therein, a leg extending on each side of the hat with the visor being received through said slot; and

means pivotally mounting the shield on the bracket forwardly of the attenuator mounting means for swinging movement through an arc in front of said visor.

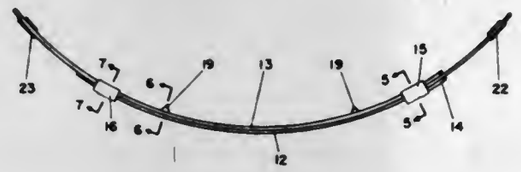
3,273,165
GLOVES FOR PLAYING SPORTS

Frank Sperandeo, 882 3rd Ave., Brooklyn, N.Y.

Filed Dec. 9, 1963, Ser. No. 329,167
1 Claim. (Cl. 2—169)

In a sports glove having the palm including the index finger portion, thumb portion and area therebetween completely free of seams, a combination of a front part and a back part secured together to form the completed glove,

(a) said back part having a back of the hand section, a wrist section and, in the area of said thumb and index finger, a thumb section only, said thumb section extending from said back of the hand section and away from said wrist section at an oblique angle with respect to the normal longitudinal axis of said back part,



(b) said front part having a palm section, a wrist section and, in the area of said thumb and index finger, an index finger section of sufficient width to extend around the front, back and thumb-facing side areas of an index finger, and a thumb section extending from said palm section and generally toward said wrist section at an angle approaching the perpendicular with respect to the normal longitudinal axis of said front part, said index finger section extending at said full width from the tip thereof to the joint with said thumb section, whereby a portion of the back of the hand and the back of the index finger will be covered by said index finger section,

the width of said front part thumb section being greater than the width of said back part thumb section, whereby the joining seams will be remote from the glove palm, said front and back part being seamed at the edges to form said completed glove.

3,273,166
ORNAMENTAL VISOR STRAP FOR A UNIFORM CAP

Patrick J. Connolly, Medfield, Mass., assignor to the United States of America as represented by the Secretary of the Army

Filed Apr. 30, 1964, Ser. No. 364,042
10 Claims. (Cl. 2—185)

1. An ornamental visor strap for a uniform headpiece comprising:

(a) an outer strap,

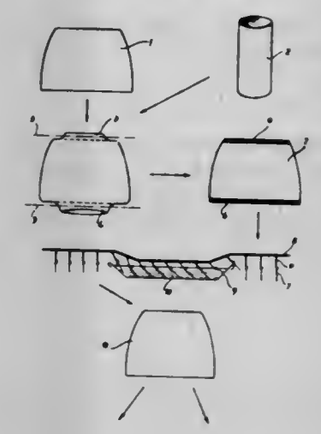
(b) an inner strap,

(c) means carried by said inner strap and adapted to engage said headpiece to prevent vertical movement of said visor strap in relation to said headpiece,

(d) a tab,

(e) a tab retainer fixed to the front face of said tab and the rear face of said inner strap near one end thereof and defining a passageway between said tab and said inner strap for slideably receiving said outer strap,

(f) a strap guide fixed to the front face of said outer strap near one end thereof and having portions extending over the top and bottom edges and at least a part of the rear face of said outer strap, said portions and the rear face of said outer strap defining a passageway for slideably receiving said inner strap, and



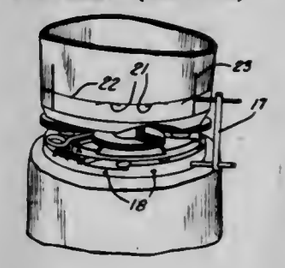
(g) means for attaching said ornamental visor strap to said headpiece, said outer strap, inner strap, tab, tab retainer and strap guide being formed from anodized and dyed metal having an ornamental design embossed thereon.

3,273,167
PROCESS FOR THE MANUFACTURE OF MIXED FABRIC AND LATEX GARMENTS

Jose Maria Massó Remiro, 3 Consejo de Ciento St., Barcelona, Spain

Filed Jan. 24, 1964, Ser. No. 340,017
Claims priority, application Spain, Feb. 2, 1963, 285,019
2 Claims. (Cl. 2—243)

1. A process for making garments of fabric and latex, comprising the steps of providing a flat mold of a material having a lower specific gravity than water, preferably carton wood whose density is 0.6 to the sillouette desired for the garment with the dimensions being somewhat greater than the dimensions of the garment, providing a fabric having elastic characteristics and of tubular form with the transverse dimension thereof being slightly less than the narrowest part of the mold, placing said fabric on said mold cutting the tubular fabric on the mold thereby leaving an excess of fabric projecting at each end of the mold, closing the ends of the tubular fabric immediately over the ends of the mold, removing the excess of fabric projecting at each end of the mold,

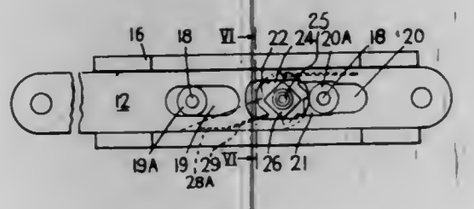


moving the fabric covered mold tangentially into a latex bath having a depth not greater than 15 cm., moving the fabric covered mold through the latex bath along a course approximately parallel to the surface of the bath, withdrawing the covered mold tangentially from the bath, drying the latex fabric covered mold under temperature and humidity conditions not exceeding 55° C. and 80% respectively, removing the excess of latex and fabric extending beyond the ends of the mold, imparting to the extremities of the tubular fabric the form of garment desired, and removing the garment from the mold for its final finish.

3,273,168
ADJUSTABLE ALIGNMENT COUPLING FOR LOWER EXTREMITY PROSTHESES

Henry F. Gardner, New York, and Anthony Staros, Northport, N.Y., assignors to the United States of America as represented by the Secretary of the Army or the Administrator of Veteran Affairs

Filed June 21, 1963, Ser. No. 289,764
8 Claims. (Cl. 3—1)



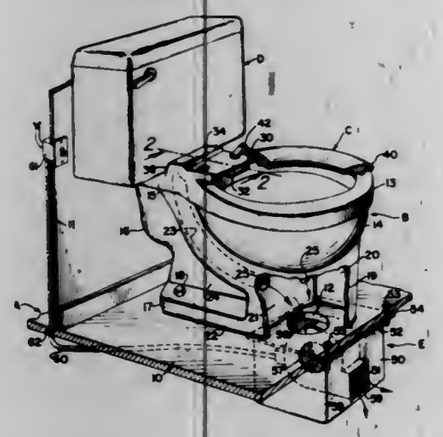
1. A prosthesis alignment coupling comprising an upper plate fastenable to an upper portion of a prosthetic limb, an intermediate plate, a lower plate fastenable to a lower portion of a prosthetic limb, means adjustably connecting said upper plate and said intermediate plate to allow relative movement between said upper and intermediate plates in a first lateral direction, means rotatably and adjustably connecting said intermediate plate and said lower plate to allow rotative movement between said intermediate and lower plates about their vertical axes and relative

movement between said intermediate and lower plates in a second lateral direction transverse to said first lateral direction, means connected to said intermediate plate for tilting said intermediate and lower plates relative to said upper plate, and transfer compass means removably and rotatably attached to a plate of said coupling to mark the alignment of said coupling on the prosthetic limb.

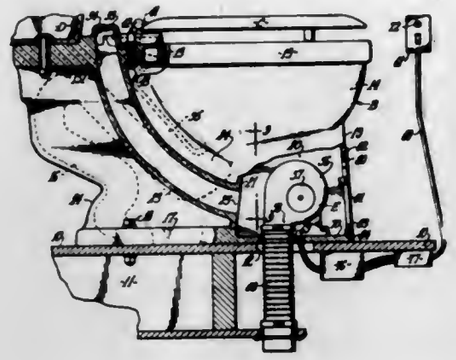
3,273,169
REMOTE ALTERNATOR FOR SELECTIVE ACTUATION OF PROSTHETIC LIMBS AND SURGICAL APPLIANCES

Alfred Henry Taylor, East Horndon, Brentwood, Essex, Alfred Charles William Ford, London, and Charles Philip Steeper, Tadsworth, Surrey, England, assignors to Hugh Steeper Limited, London, England, a British company

Filed Aug. 6, 1963, Ser. No. 300,214
Claims priority, application Great Britain, Aug. 9, 1962, 30,597/62
10 Claims. (Cl. 3—12.3)



10. For use in a prosthetic device, mechanism for actuation of alternate functions at a location remote from the said mechanism comprising: a first member, a second member movable to and fro on said first member, a ratchet wheel rotatably mounted on said first member, driving means on said second member for rotating the ratchet wheel, an abutment member rotatable by the ratchet wheel, and means on said second member selectively engageable with the rotatable abutment member according to the rotative position thereof, the said means on said second member permitting different amounts of to and fro movement of the second member, thus permitting different amounts of movement to be transmitted to a remote location.

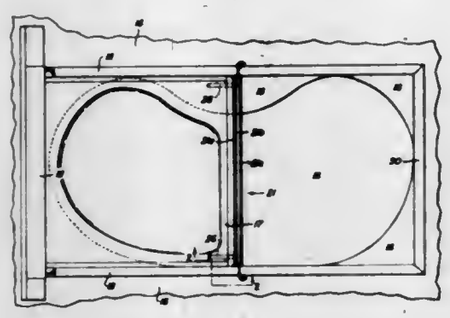


3,273,170
TOILET VENTILATING APPARATUS

Robert I. Wheeler, 5626 Imperial Highway, Southgate, Calif.

Filed Oct. 20, 1965, Ser. No. 505,586
15 Claims. (Cl. 4—72)

1. In combination: a toilet bowl comprising a bowl body; a base beneath the rearward portion of said body and integral therewith; an integral skirt beneath the forward portion of said body, defining a suction chamber beneath said bowl and having a bottom adapted to be mounted to a floor for supporting said base and skirt; a ventilating duct extending forwardly along the side of said bowl and communicating with said suction chamber at its forward end; a suction mouth integral with the rearward portion of said bowl and providing communi-

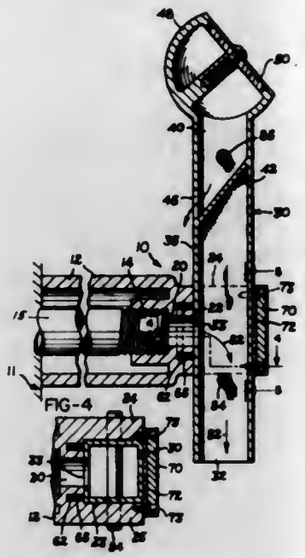


cation between the rearward end of said ventilating duct and a rearward area within said bowl for withdrawing odorous vapors therefrom; whereby suction applied to said chamber will be effective to develop a ventilating flow of air laden with said vapors, from within said bowl into said suction chamber for discharge through said port.

3,273,171
CARRIER FOR FORWARD EDGE OF EXTENDIBLE AND RETRACTABLE FLEXIBLE SHEET

Joe H. Lamb, Salt Lake City, Utah, assignor, by mesne assignments, to Cover-Pools Incorporated, Salt Lake City, Utah, a corporation of Utah

Filed Aug. 7, 1961, Ser. No. 131,049
18 Claims. (Cl. 4—172)

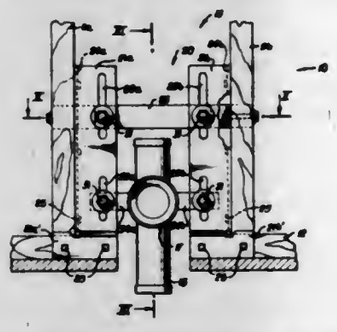


1. In combination, a horizontally disposed sheet of flexible material; stationary means at one end of said sheet for extending and retracting the sheet relative to a horizontal area to be protectively covered thereby; a relatively rigid, traveling strip at the other end of said sheet extending along and secured to the sheet as a forward margin thereof; a pair of offset axles, the individual axles of which are journaled in opposite ends of the strip, respectively, and have respective offset portions extending outwardly therefrom, with respective spindle ends offset from but parallel with the journaled portions of said axles, so that said strip can be raised for travel; a pair of wheels, the individual wheels of which are journaled on said spindle ends, respectively, and are adapted to ride adjacent said area to be covered during travel of said strip; and means for retaining said strip in raised position during extending and retracting movement of strip and sheet following raising said strip with respect to said wheels.

3,273,172
BATHROOM FIXTURE

Karl W. Wilks, Jr., P.O. Box 146, Vandalia, Ohio; Jeannette D. Wilks, executrix of said Karl W. Wilks, Jr., deceased

Filed Aug. 26, 1963, Ser. No. 304,511
9 Claims. (Cl. 4—192)



1. A tub mounted spraying device comprising a spout adapted to extend inwardly into a bath tub, means in said spout defining a water passageway therethrough opening at a wall thereof, a diverter member mounted for relatively sliding movement on said spout, means in said member forming a cooperating wall portion adjacent said spout wall and having a passage therein opening at said wall portion and communicating with said passageway of said spout in one selectable position of said member, means forming a spray head on said member communicating with said passage and positioned by said member when said member is in said one position to direct a spray therefrom upwardly and outwardly into said tub, and low friction seal and bearing means in said spout wall surrounding said opening having a portion in sealing engagement with the adjacent said wall portion throughout the sliding movement thereof.

3,273,173
WALL CLOSET CARRIER

Earl L. Morris, Whittier, and George Lee Curtice, Downey, Calif., assignors to Acorn Engineering Company, Los Angeles, Calif., a corporation of California

Filed Apr. 22, 1963, Ser. No. 274,469
5 Claims. (Cl. 4—252)

1. A carrier device for hanging and supporting a wall hung water closet for installation behind the finished surfaces of a wall of the type constructed with spaced vertical studs and horizontal sill forming a space for a soil drain fitting, comprising:

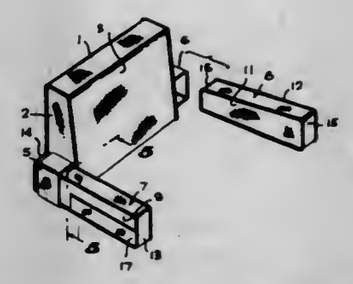
a pair of upstanding laterally spaced, elongated closet hanger plates, each having a front portion parallel to the plane of the wall and a rearwardly extending side portion perpendicular to the front portion, said side portions being securable to opposing surfaces of spaced vertical studs defining the space for a soil drain fitting;

each of said hanger plates having a lower end having a laterally extending toe portion lying in a plane parallel to but offset forwardly of the front portion, said lower ends and toe portions being securable to wall surfaces of a horizontal sill adjacent said space;

an elongated upper and lower vertical slot in the front portion of each hanger plate;

vertically adjustable securing means for cooperation with said lower slots to secure and position a soil drain;

and vertically adjustable closet support means including a horizontal member of U-shaped configuration, said member having a bottom provided with spaced ports and rearwardly extending end sections,



a stud-like member extending forwardly through each of said ports and an upper slot in the front portion of a hanger plate and connecting said horizontal member and plate to support a wall hung water closet;

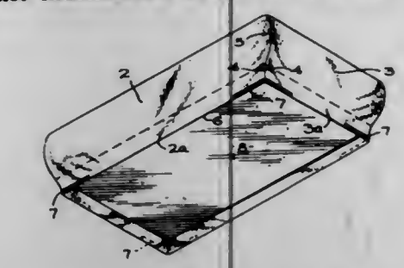
said rearwardly extending end sections of said horizontal member including means for connecting the ends directly to vertical studs defining said space.

3,273,174
BED REST PILLOW

Genaro Cassini, Los Angeles, Calif., assignor to A & D Associates, Los Angeles, Calif., a corporation of California

Filed Oct. 20, 1964, Ser. No. 405,213
5 Claims. (Cl. 5—327)

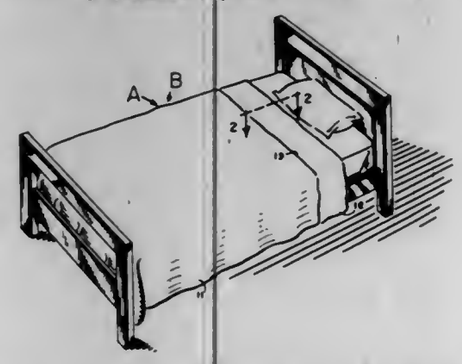
1. A bed rest pillow comprising: a backrest having top, bottom, front and rear surfaces, said backrest also having two side surfaces extending upwardly from said bottom surface to said top surface and forwardly from said rear surface to said front surface; a first loop of material attached to one of said side surfaces near said bottom surface; a second loop of material attached to the other of said side surfaces near said bottom surface; a first armrest having one end removably mounted in said first loop; and a second armrest having one end removably mounted in said second loop.



3,273,175
SELF-TUCKING FITTED SHEET

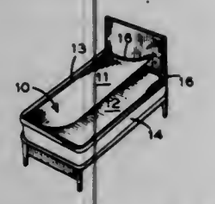
Martin Anderson and Hattie T. Anderson, both of 1-H Gardenway, Greenbelt, Md.

Filed Feb. 7, 1964, Ser. No. 343,296
7 Claims. (Cl. 5—334)



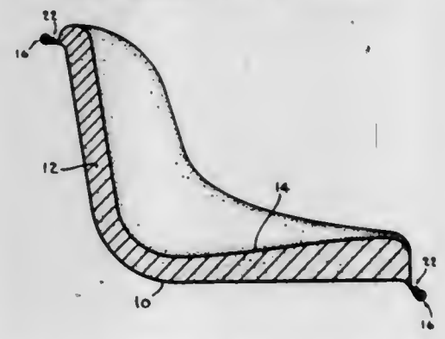
1. A self-tucking cover for a mattress, or the like, substantially conforming to the top, side, and end contours thereof comprising: an endless flap portion adapted to depend below said mattress; an endless free edge of said flap portion; corner segments of said free edge; tensioned linear corner elastic means in cooperation with said cor-

ner segments whereby said endless flap portion is self-tucking in cooperation with said elastic means; and concave corner indentations of said endless flap portion, said



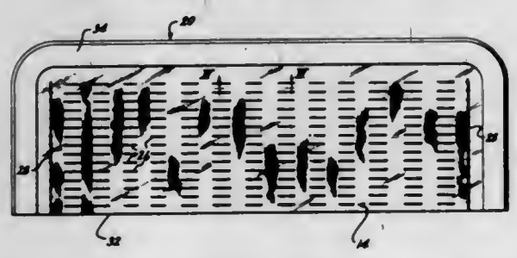
indentations, independently of said elastic means, being adapted to inwardly underlie the corners of said mattress and position said flap portion beneath said corners and said cover upon said mattress.

3,273,176
SANITARY BLANKET
Rutherford Y. Millar, 1596 Greenwood Drive, Calistoga, Calif.
Filed June 15, 1964, Ser. No. 375,046
5 Claims. (Cl. 5—334)



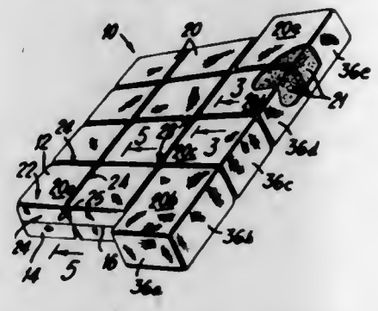
1. A bed covering comprising: a blanket body formed of relatively lasting material; an extension flap of generally the same width and of substantially shorter length than said blanket body; means secured to one end of said blanket body to attach removably one end of the flap to said end of the blanket, and wherein said means comprises: a first zipper strip attached along one edge of said blanket body; a second zipper strip attached along one edge of said flap, said second zipper strip designed to join said first zipper strip; joining means attached to said zipper strips to join said second zipper to said first zipper.

3,273,177
FIREPROOF MATTRESS COVER AND PROTECTIVE SHIELD
Leroy C. Newton, 1343 Fairfield Ave., Bridgeport, Conn.
Filed May 17, 1965, Ser. No. 456,171
3 Claims. (Cl. 5—335)



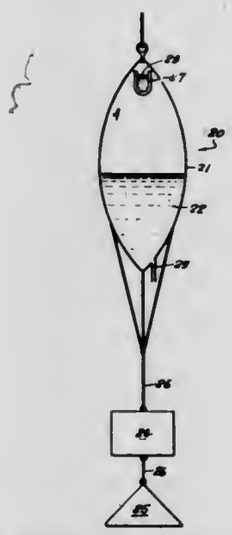
1. A fireproof pad comprising a first panel and a second panel, each of said panels being flat and sized to cover a given area of a piece of upholstered fruniture, and each of said flat panels being formed of a single layer of soft tightly woven fireproof fabric, and means for securing said panels together along common edge thereof so as to permit folding of said panels between a coincident overlying position thereof to form a double ply covering pad for said furniture piece and a spread open position to define an extended single ply pad adapted for use on a fire shield to crash through a wall of flames, and hand straps connected to one side of each of said panels to define a hand hold whereby the same may be held in a spread position to define a fire shield, said hand straps being connected to the inside surface of the respective panels when said panels are disposed in their folded overlying position.

3,273,178
METHOD AND MEANS FOR SECURING SEAT COVERS TO THE BASE STRUCTURE OF A SEAT
Elmore J. Baruth and William C. Oswald, Milwaukee, Wis., assignors to Bostrom Corporation, Milwaukee, Wis., a corporation of Wisconsin
Filed June 22, 1964, Ser. No. 376,974
8 Claims. (Cl. 5—353.2)



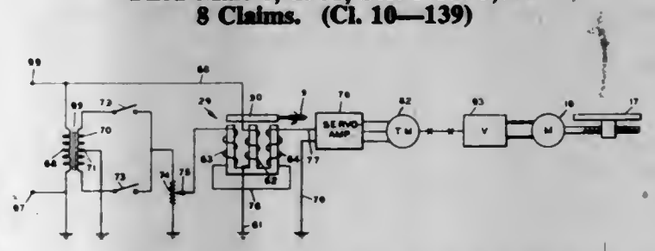
1. Means for securing a seat cover to the base structure of a seat comprising, a C-shaped member formed on the periphery of the base structure and receiving a terminal cover portion of the cover and a welt which is of larger cross-section than the distance between the edge of one jaw of said C-shaped member and said cover portion, said cover portion and said welt being bonded to each other, said welt being bonded to the upper inside portion of said C-shaped member by a bonding material, said terminal portion being bonded to the lower inside surface of said C-shaped member, said bonding material, after being hardened in assembly of the combination, forming a firm and relatively thick layer between said welt and the inside surface of said C-shaped member when compared to the layer between said terminal portion and said inside surface, to thereby proivde firm material in addition to said welt which will resist a force tending to pull the welt and cover from the engaged position within said C-shaped member.

3,273,179
INSULATOR FOR FOAM PADS AND METHOD OF MAKING THE SAME
Willard L. Ridenour, Ann Arbor, Mich., assignor, by mesne assignments, to Hoover Ball and Bearing Company, Saline, Mich., a corporation of Michigan
Filed Mar. 19, 1963, Ser. No. 266,347
3 Claims. (Cl. 5—354)



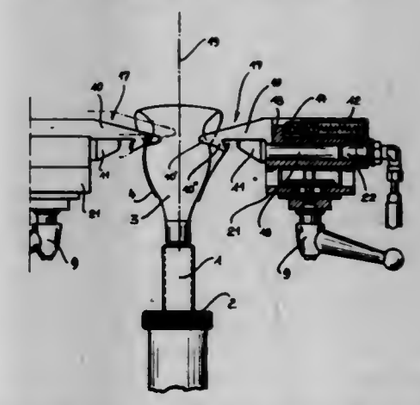
1. In combination, a foam pad having a spring-supported surface, a spring insulator molded to said pad upon said surface, said insulator including a flexible foam-pervious sheet disposed adjacent the foam defining said surface, a flexible, lightweight, foam-impervious sheet superimposed upon the side of said pervious sheet remote from the pad foam, and means affixing said sheets together at spaced locations permitting limited separations of said sheets intermediate said spaced locations, whereby said sheets will be maintained adjacent said pad surface during foaming of said pad and foam, and a portion of the foam adjacent said surface will completely penetrate said pervious sheet intermediate said spaced locations.

3,273,180
UPHOLSTERY PANEL
Jack Feinerman, 28 Chapel St., New London, Conn.
Filed Oct. 8, 1964, Ser. No. 402,520
5 Claims. (Cl. 5—355)



1. A stuffed upholstery panel comprising a pair of preformed top and bottom panel covers, each of which is preformed with a plurality of adjacently located, interconnected shaped individual pillows; means along the marginal edges joining said panel covers in facing relationship to each other so as to enclose shaped volumes therebetween, and means throughout the body of the panel connecting said covers to each other only at aligning corners of the individual pillows of each; and resilient means contained within each panel pillow formed by the facing pillows of the interconnected panel covers.

3,273,181
SELF-PRESSURIZED DEEP OCEAN BUOY
Earl J. Beck, Jr., 1323 W. Fir Ave., Oxnard, Calif.
Filed May 26, 1964, Ser. No. 370,383
6 Claims. (Cl. 9—8)



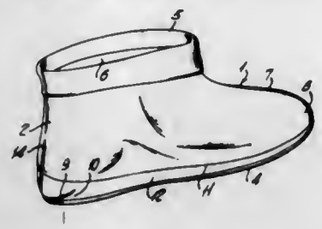
1. A self-pressurized lightweight deep ocean buoy comprising, in combination:
a lightweight metal hollow shell having an upper nose portion and a lower tail portion, said shell being of greater length than its major cross-sectional diameter;
a single vent formed in said shell, said vent being located in the lower tail portion of said shell for admitting ambient water under pressure to the interior of said hollow shell;
oceanographic instrument means attached to the lower portion of said shell;
a quantity of highly vaporizable substance carried interiorly of the nose portion of said hollow shell adapted to release a volume of high pressure gas sufficient to establish a positive buoyancy of said deep ocean buoy enabling it to return the said instruments to the surface; and
said quantity of highly vaporizable substance being contained in an insulated open container which is mounted in the nose portion of said shell.

3,273,182
FEED CONTROL DEVICE TO FEED TOOL SPINDLE AT RATE OF TOOL ADVANCE
David I. McDonald, Cincinnati, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Filed Mar. 6, 1961, Ser. No. 93,798
8 Claims. (Cl. 10—139)

1. A device for automatically synchronizing the feeding movement of a tap with its speed of rotation comprising a work support for holding a workpiece to be tapped, a power operated spindle disposed adjacent said work support, a tap holder supported in said spindle for limited axial movement relative thereto, a differential transformer, means operatively connecting said transformer with said holder so as to cause a signal to be produced by said transformer upon axial displacement of said holder in said spindle, and a servomechanism controlled by the signal from said transformer for feeding said spindle relative to said work support at a rate equal to the rate at which the tap threads its way into the workpiece upon rotation of the spindle.

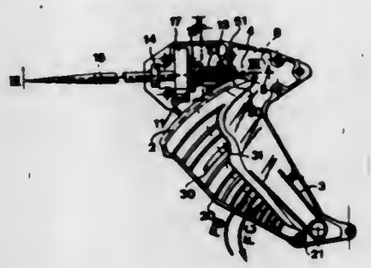
3,273,183
GRIPPERS FOR A HEEL LASTING MACHINE
Herbert Schindler, Wagenstrasse 38, Pirmasens, Germany
Filed Aug. 16, 1965, Ser. No. 479,941
Claims priority, application Germany, Aug. 17, 1964, Sch 35,634
10 Claims. (Cl. 12—11.3)

1. Apparatus comprising means for supporting a last having an upper surface adapted to support an insole and having sides along which extends uppers constituting,



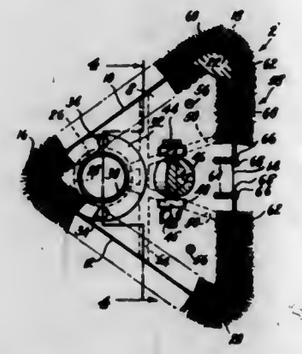
with said insole, part of a shoe, said means having a center plane, gripping means on opposite sides of the last and including relatively movable members adapted to clamp the uppers on opposite sides of the last and generally at the level of said upper surface, means to actuate the gripping means to engage the uppers between said members and to move the gripping means towards said center plane to wipe said uppers over said last, a thrust device for holding the insole against said last, means coupling said device and said gripping means for cooperative movement, said means for actuating the gripping means including a shaft supporting said gripping means, an angle arm coupled to said shaft to rotate the same and change the position of the gripping means relative to the upper surface of the last, and piston and cylinder elements coupled to one of the members of each gripping means to control the clamping of the uppers, said thrust device being mounted on said angle arm, arms mounted on said shaft and supporting said gripping means, and lost motion connection means between said arms and shaft whereby the thrust device is moved by said angle arm before the gripping means is moved, each said gripping means including a spring between said members and against which the associated piston and cylinder elements operate, at least one member of each gripping means having an inclined surface adapted to ride up over the last.

3,273,184
AUTOMATIC MACHINE FOR THE ASSEMBLY OF HEELS TO THE SOLES OF SHOES
Alberto Bruggi, % Dr. Cicogna Franco & Co., Via Visconti di Modrone 14a, Milan, Italy
Filed Apr. 13, 1964, Ser. No. 359,170
13 Claims. (Cl. 12—16.4)



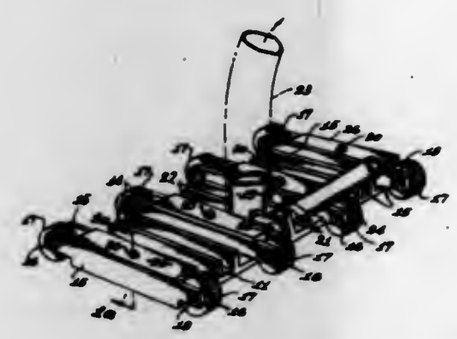
1. In a machine for securing a breast flap portion of a loose outsole to a loose heel at least one of the latter being applied with an adhesive, first support means for supporting a portion of an outsole having a breast flap portion freely extending therefrom; second support means for supporting a heel to be assembled with the outsole, at least one of said means being movable with respect to the other of said means between a first position in which the heel and the outsole are spaced from each other and a second position in which the heel and the breast flap portion of the outsole are adjacent to each other; turning means carried by said first support means, said turning means including a portion adapted to engage the free breast flap portion of the outsole supported by said first support means and movable with respect to said first support means, when said one means is in said first position thereof, for bending the breast flap portion of the outsole with respect to the supported portion thereof to a position where the former portion is located in a plane transverse to the plane of the latter portion; and pressing means operative to press said breast flap portion of the outsole to the portion of the heel adjacent thereto when said one means is in said second position thereof to cause the breast flap portion to be adhesively applied to the heel.

3,273,185
METHOD OF MAKING AN ELECTRONICALLY HEAT SEALED FOOT COVERING
Myron Winson, 15 S. Gate Drive, Spring Valley, N.Y., and Jonathan Winson, 793 East Drive, Oradell, N.J.
Original application July 26, 1963, Ser. No. 297,896. Divided and this application Feb. 1, 1966, Ser. No. 524,271
6 Claims. (Cl. 12—142)



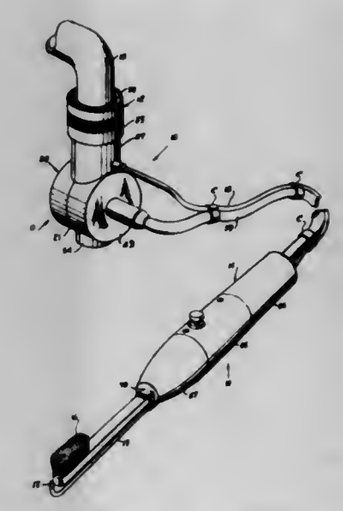
1. The method of making an electronically heat sealed foot covering of a desired width which comprises providing upper and lower blanks of thermoplastic sheeting, the upper blank being open along its counter portion, maintaining the lower blank in a substantially flat plane, positioning the upper blank in contact with the lower blank, heat sealing the upper to the lower using a flat die electrode of generally U-shape so as to make a heat seal which is spaced from the periphery of the sole at least in the region rearwardly of the shank, thereby providing a heat seal along the sides and toe portions of the periphery of the foot covering, positioning the ends of the upper together in its counter portion with the lower folded on itself in the heel region, heat sealing the contiguous parts of the counter and heel using a flat die electrode thereby forming a counter seal closing the back of the foot covering, placing the sealed assembly with its lower blank substantially flat, and making a heel seal using a flat die electrode across the lower blank in a direction generally perpendicular to the counter seal so as to pinch off excess material in the heel.

3,273,186
PORTABLE CLEARING DEVICE FOR FIBRE ENDS, BROKEN THREADS AND THE LIKE
Angelo Pagani and Mario Vezzoli, both of San Pancrazio, Brescia, Italy (both % Dr. Ing. Misitano A.G., Via Padova 217, Milan, Italy)
Filed May 27, 1964, Ser. No. 370,424
Claims priority, application Italy, June 20, 1963, 12,580/63
1 Claim. (Cl. 15—1.5)



A device for clearing fibre ends, broken threads and like flying bodies produced in the operation of textile machinery, characterized in that it comprises a portable support frame made of plastic material, a manually actuated control member, an overdrive gearing of the motion derived from the control member, a spindle actuated by the said overdrive gearing, a tip to be removably fixed to the said spindle and made of plastic material for attracting by electrostatic effect the fibre ends, a flywheel for storing the kinematic energy, and a ratchet wheel device permitting a unidirectional and rapid revolution of the spindle during the actuation of the control member, the said ratchet wheel device consisting of a half moon shaped spring to be fixed at its ends to the said flywheel and made of plastic material, a clip integral with that said spring, a ratchet wheel cooperating with the said clip, and mounted coaxially to the said spindle.

3,273,187
VACUUM CLEANER HEAD
Adonis D. Williams, 1009 Krumroy Road, Akron 6, Ohio
Filed Jan. 14, 1965, Ser. No. 425,492
10 Claims. (Cl. 15—1.7)



1. A vacuum cleaner head for cleaning swimming pools, especially pools lined with sheet plastic or the like, comprising: a generally triangular base plate having a bore therethrough, the undersurface of said plate having a plurality of intersecting grooves therein, arranged to communicate with the lower end of said bore; means carried by said base plate for connecting a vacuum hose to the upper end of said bore; and a brush secured to said base plate to extend around at least a major portion of the periphery thereof, said brush extending around the corners of said plate, and the bristles of said brush extending downwardly and outwardly from the periphery of said plate a distance sufficient to provide a large brushing area and to provide a buffer for preventing said plate from striking and damaging the wall surfaces on which said cleaner head is used.

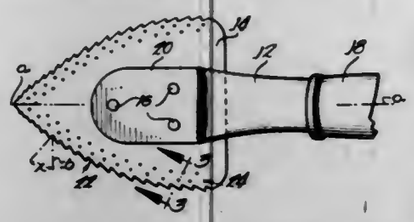
3,273,188
VACUUM HEAD FOR SWEEPING SWIMMING POOLS
Walter R. Levack, 258 Avalonia St., Playa del Rey, Calif.
Filed July 23, 1965, Ser. No. 474,270
8 Claims. (Cl. 15—1.7)

1. A vacuum head for cleaning swimming pool bottoms comprising: a platform of relatively flexible plastic material having transverse ribs extending upwardly from its upper surface to rigidify the platform in a transverse direction while permitting longitudinal flexing thereof; a downwardly directed flange around the edge of said platform to form a shallow chamber at the under surface thereof; rollers supporting said platform with its edge flange spaced above the surface on which the rollers move; means providing a suction opening through the platform into said shallow chamber for connection to a suction line; and means for moving said vacuum head over a pool bottom to be cleaned.

3,273,189
CLEANING APPARATUS
Louis E. Levinson, Dallas, and Ernest J. Worley, Garland, Tex., assignors to General Business Corporation, Dallas, Tex., a corporation of Texas
Filed June 22, 1965, Ser. No. 465,992
15 Claims. Cl. 15—22)

9. A hand unit including: a hollow elongate handle, a motion translating device having an input shaft and an output shaft, said input shaft being rotatable by a flexible shaft adapted to be connected to said input shaft, said motion translating device translating rotary motion of said input shaft into oscillatory motion of said output shaft through a predetermined angle about the longitudinal axis of said output shaft; a tooth brush shaft rotatably mounted in said housing and extending forwardly therefrom, said brush shaft having means exteriorly of said housing for connecting a tooth brush thereto; and clutch means for selectively connecting said tooth brush shaft to said output shaft.

3,273,190
WIRE POLISHER
Samuel W. McClemens, Holsopple, Pa., assignor, by mesne assignments, to Bethlehem Steel Corporation, a corporation of Delaware
Filed Oct. 23, 1962, Ser. No. 232,486
3 Claims. (Cl. 15—104.04)

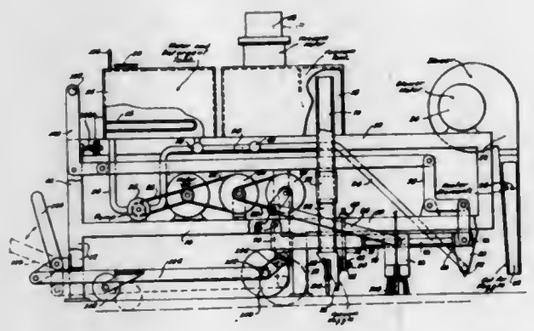


1. An apparatus for polishing wire continuously moving in a longitudinal direction, said apparatus comprising:

(a) a pair of supports, spaced longitudinally along and offset from the axis of said wire,

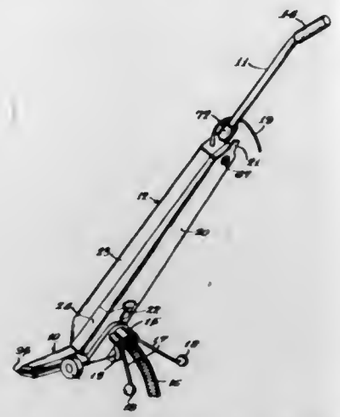
(b) a coil spring, the unstressed length of which is less than the distance between said supports, said spring being stretched and held in tension between said supports and helically wrapped at least once completely around said wire, the outside of said spring being in contact with said wire.

3,273,191
KNIFE IMPLEMENT
William H. Chambers, 5457 N. Artesian, Chicago, Ill.
Filed May 21, 1964, Ser. No. 369,077
9 Claims. (Cl. 15—105)



1. A blade for a knife implement having a pointed tip and at least two edges which taper outwardly in opposite directions from said tip; a plurality of teeth on each of said edges, said teeth progressively increasing in size as the edges of said blade are rearwardly traversed from said tip and angularly disposed with respect to a plane perpedicular to the axis of said blade, with the angle being progressively decreased as the edge of said blade is rearwardly traversed from said tip; and a plurality of perforations providing uprising tips on one side of said blade formed in said blade along said edges adjacent to said teeth.

3,273,192
PAINT ROLLER DEVICE HAVING A PIVOTALLY ADJUSTABLE HANDLE
Louis Mazzella, 2888 Morris Park Ave., Bronx, N.Y.
Filed Apr. 26, 1965, Ser. No. 450,684
1 Claim. (Cl. 15—230.11)

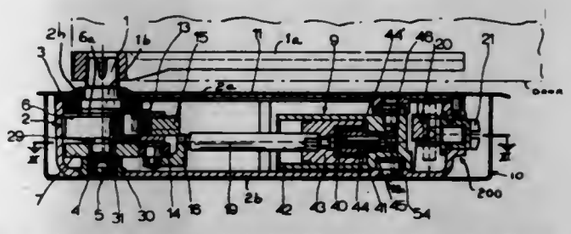


A paint roller device comprising:
(a) a paint roller cover having an axial bore;
(b) a one-piece support structure for said roller cover formed of a rod shaped to provide a shaft section, a carrier portion connected at one end to one end of said shaft section and at right angles thereto, an arm portion parallel to said shaft section connected at one end to the other end of said carrier portion and a shank portion connected at one end to the other end of said arm portion and at right angles thereto, said support structure lying in a plane,
(c) said shank portion being disposed substantially at the center of said roller cover and normal thereto,
(d) spaced collars rotatable on said shaft section, each positioned at an end thereof corresponding to the ends of said roller cover,
(e) circumferentially spaced rods equally radially spaced from said shaft sections, having their ends respectively fixedly secured to said spaced collars, whereby to provide a rotating axial cage on said shaft section,
(f) said axial cage fitting within the axial bore of said roller cover in fixed relation thereto to provide for rotation of said roller cover on said shaft section,
(g) a handle including a rod extension at one end thereof,
(h) a pair of discs fixedly secured respectively to the free end of said rod extension and to the free end of said shank portion and lying in planes parallel to the plane of the support structure,
(i) a central opening in one disc and a threaded stud projecting from the center of the other disc through said central opening,
(j) radial ribs and grooves on the opposed faces of said discs for interlocking adjustable engagement therebetween,
(k) a winged nut on said stud for clamping said discs together in selected angularly related positions,
(l) there being a threaded axial bore in the other end of said handle, and
(m) a handle extension having a threaded projection engageable in the threaded bore of said handle.

3,273,193
CLEANING APPARATUS
Alexius Soderholm and Stig A. Soderholm, Palos Verdes, Calif., assignors to Concept Development Corporation, Beverly Hills, Calif., a corporation of California
Filed Mar. 22, 1965, Ser. No. 444,920
13 Claims. (Cl. 15—320)

6. In an apparatus of the character described for cleaning the moving steps of an escalator as the steps travel relative to a sill platform at one end of the escalator, the combination of:
a body structure for positioning on the sill platform with a forward portion of the body structure overhanging the approaching steps;
wheel means mounted on the body structure to make the body structure mobile for transportation from one escalator to another;
means operable in one respect to immobilize the body structure on a sill platform for a cleaning operation in substantially a horizontal position, and operable in an opposite respect to free the body structure for transportation while retaining the horizontal position of the body;
scrubbing means for scrubbing the surfaces of the approaching steps; and
means for mounting said scrubbing means to the forward portion of the body structure, to render the scrubbing means responsive to immobilization and freeing of the body structure for positioning said scrubbing means in a first, relatively low level in relation to the approaching steps and in response to immobilization of the body structure, and in a second, higher level above the surface of the approaching steps in response to freeing of the body structure for transportation.

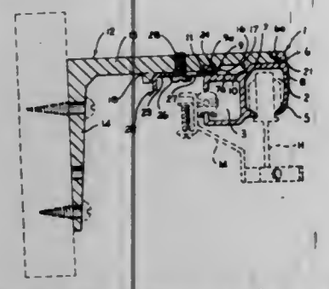
3,273,194
VACUUM CLEANER
Ivar Jepson and Julius P. Wied, Oak Park, and Gilbert R. Wolter, Elmhurst, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed May 31, 1963, Ser. No. 284,441
3 Claims. (Cl. 15—323)



1. An upright vacuum cleaner comprising a floor engaging suction nozzle, a stick-like handle, an elongated generally rectangular box-like rigid casing pivotally interconnecting the nozzle and handle, the forward end of said casing being divided into superposed air impeller and motor chambers and the remainder of said casing comprising a dust collecting chamber, each of said chambers being shallow relative to their other dimensions and said impeller and motor chambers having a vertically superposed relationship with respect to each other when said casing is horizontally disposed, the bottom back side of said dust collecting chamber being removable to provide a removable panel on said casing to afford access to said dust collecting chamber, a dust collecting bag in said dust collecting chamber, said bag being elongated and being removably connected at one end thereof with said impeller chamber, said handle being removably connected to the upper end of said casing solely by disconnecting means disposed inside said casing, said panel affording access to said disconnecting means, and an electric control circuit for said cleaner comprising an electric extension cord and a control switch, said switch being disposed inside the upper end of said casing, and the upper end of said casing having an entrance aperture formed therein for reception of said extension cord whereby removal of said handle from the upper end of said casing leaves the electric control circuit of said cleaner intact.

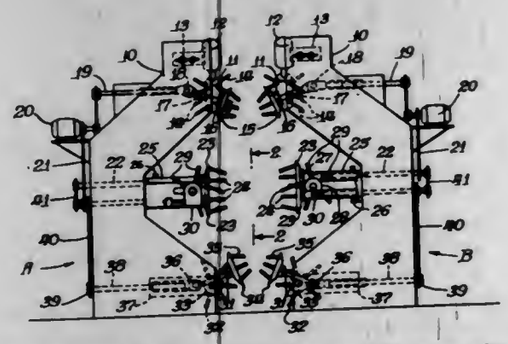
3,273,195
PUSH-BROOM-TYPE VACUUM CLEANER
Ivar Jepson, Sister Bay, Wis., and Julius P. Wied, Oak Park, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed June 10, 1964, Ser. No. 374,029
6 Claims. (Cl. 15—344)

1. A push-broom-type vacuum cleaner, comprising an elongated upwardly projecting main housing and support member constructed from molded plastic material, an integral suction nozzle portion formed at the lower end of said main member, an integral fan scroll chamber formed on the bottom of said main member behind said nozzle portion, an integral motor chamber formed on the top of said main member above said scroll chamber, the bottom of said motor chamber being open, a motor mounting plate closing the bottom of said motor chamber, a motor mounted on the top of said plate, said motor being insertable into said motor chamber through its bottom opening, an elongated one piece bottom cover member for said scroll chamber and the bottom of said main member, an integral elongated exhaust passageway formed between said main and cover members, said passageway extending from said scroll chamber to the upper end of said members, an aperture formed in said plate, said motor having a depending motor shaft, said shaft extending through said aperture into said scroll chamber, a fan on said shaft in said scroll chamber, an elongated dust chamber formed on top of and integrally with said main member behind said motor chamber, an elongated top cover member for said dust collecting chamber, an opening formed in the upper end of said main member between said passageway and dust collecting chamber, and a stick type handle rigidly connected to the upper end of said main member.



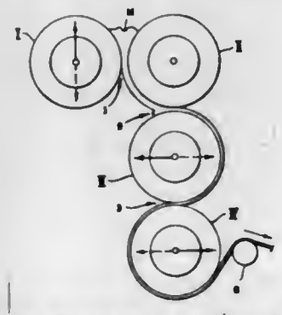
3,273,196
DOOR CHECK
Reinhold Vöster, Stuttgart-Degerloch, and Wolfgang Schmid, Stuttgart-Feuerbach, Germany, assignors to Vereinigte Baubeschlagfabriken Gretsch & Co. G.m.b.H., Leonberg, Wurttemberg, Germany
Filed Dec. 23, 1964, Ser. No. 420,592
Claims priority, application Germany, Dec. 24, 1963, V 25,084
19 Claims. (Cl. 16—82)

1. In a door check, a housing containing a supply of hydraulic fluid; a spindle rotatably mounted in and having an end extending from said housing; a control cam mounted on the spindle in said housing; a spring-biased follower for tracking and for normally holding said control cam in an angular position in which a swinging door connected to the end of said spindle is closed; a check cam angularly movably mounted on the spindle in said housing, said spindle and said check cam having cooperating portions for determining the extent of relative angular movement therebetween; a second follower for tracking said check cam; and a damper mechanism provided in said housing and operative to bias said second follower against said check cam, said damper mechanism comprising a cylinder member and a piston member one of which is operatively connected with said second follower and the other of which is secured to said housing, said piston member being reciprocable in said cylinder member to respectively expel and draw fluid from said housing, and relief valve means provided in said cylinder member and arranged to open shortly



before said check cam reaches a dead center position with reference to said second follower while said piston member moves in a direction to expel fluid from said cylinder member.

3,273,197
STRUCTURAL DEVICE
James A. Ford, Sturgis, Mich., assignor to Kirsch Company, Sturgis, Mich., a corporation of Michigan
Filed Feb. 8, 1965, Ser. No. 433,539
23 Claims. (Cl. 16—94)

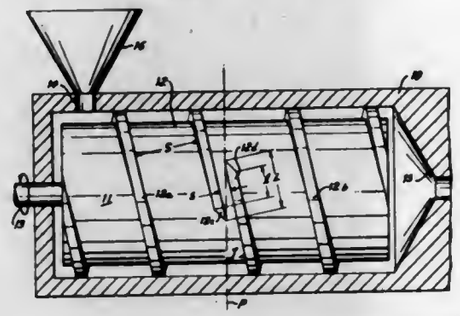


1. A traverse rod and support bracket, comprising:
an elongated hollow traverse rod having front, top and rear walls, said top wall having means defining groove means which is open along one lateral side thereof, said rod having upstanding surface means extending from one end to the other end of said rod and disposed in front of and extending above said groove means whereby said groove means is concealed from view from in front of said rod by said surface means;
a bracket having a mounting portion located rearwardly of said rear wall of said rod and having a horizontal rod-engaging portion extending frontwardly from said mounting portion over said top wall of said rod, said mounting portion being fastenable to a supporting surface, projection means on said rod-engaging portion, said projection means extending into said groove means and supportingly engaging said means defining said groove means, said surface means extending at least as high as said bracket whereby said bracket is concealed from view from in front of said rod by said surface means;
securing means supported on said bracket and located readwardly of said rod and releasably supportingly engaging said rod at a position laterally spaced from said groove means whereby said projection means and said securing means support said rod on said bracket.

3,273,198
APPARATUS FOR REMOVING FEATHERS FROM POULTRY
Kent Tomlinson, 13145 Coronado Drive, North Miami, Fla.
Filed May 28, 1964, Ser. No. 370,813
14 Claims. (Cl. 17—11.1)

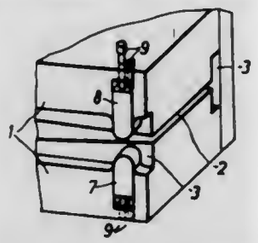
1. A machine for removing feathers from poultry consisting of two oppositely-disposed metal frames having the same construction and parts, said frames facing each other but separated enough to allow a fowl suspended by its legs to hang head down and pass between said frames, each frame containing a series of horizontal drums with rubber-like fingers extending radially from the surfaces of said drums, and a series of rotating discs alternately intervening between said horizontal drums with rubber-like fingers extending perpendicularly from said discs, and said horizontal drums being parallel to the passage of the suspended fowl, while said rotary discs face towards the same passage and are alternately above and below the center lines of said horizontal drums.

3,273,199
CALENDER FOR DRAWING FOILS AND THE LIKE OF SYNTHETIC MATERIAL
Jan Kleinewefers, Krefeld, Germany, assignor to Joh. Kleinewefers Söhne, Krefeld, Germany
Filed May 4, 1964, Ser. No. 364,853
Claims priority, application Germany, May 7, 1963, K 49,675
5 Claims. (Cl. 18—2)



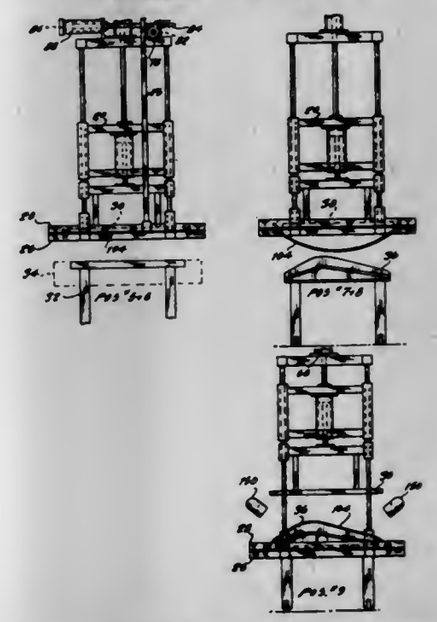
1. In a calender having a train of at least three rollers for drawing synthetic foils, in which material fed between the first two rollers in said train passes successively between said rollers until it leaves the last roller; means for supporting the last three rollers with their axes in parallel planes, and including means for angularly adjusting each of the last two rollers with their axes maintained in parallel planes, the means for supporting the roller next preceding the last two rollers maintaining its axis in a plane perpendicular to said parallel planes.

3,273,200
DISTRIBUTOR PLATE
Julius Shrensel, Richmond, Va., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York
Filed Apr. 15, 1964, Ser. No. 359,869
2 Claims. (Cl. 18—8)



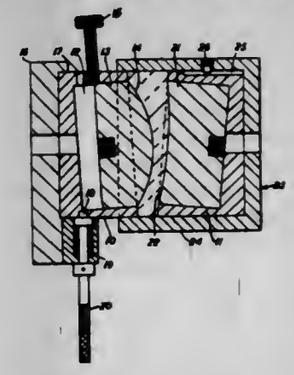
1. In melt spinning apparatus, a distributor plate with a plurality of passageways, and a multihole spinneret next downstream from said distributor plate; and in said distributor plate the walls of the passageways describe a rotation of about 90° from the entrance end to the exit end of each passageway, all the rotations being in the same sense; the longitudinal axis of each passageway is straight and perpendicular to the faces of the plate, the passageways are equi-spaced in cylindrical arrangement concentric with the center of the plate, and the passageways are uniform and are of rectangular cross section, with the long dimension of the rectangular entrances tangent to the circle in which the entrances lie at the top face of the distributor plate, and with the walls rotating to bring the long dimension of the rectangular exits to a position along the radius of the circle in which the exits lie at the bottom face of the distributor plate.

3,273,201
FEED SCREW FOR EXTRUSION PRESS
Fritz Reifenhäuser, Troisdorf, Bezirk Cologne, Germany, assignor to Firma Reifenhäuser K.G., Troisdorf, Bezirk Cologne, Germany, a corporation of Germany
Filed June 28, 1965, Ser. No. 467,439
Claims priority, application Germany, Mar. 18, 1965, R 40,142
6 Claims. (Cl. 18—12)



1. A feed screw for delivering plastified resinous material to the nozzle of an extrusion press, comprising a substantially cylindrical body provided with at least one external helicoidal thread, said thread being split longitudinally into a plurality of peripherally offset sections with spacedly overlapping ends, said overlapping ends extending at least to a common plane transverse to the axis of said body.

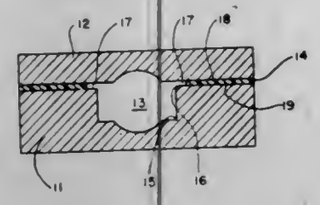
3,273,202
APPARATUS FOR MANUFACTURING THERMOPLASTIC FOILS WITH BEADED EDGES
Hieronymus Zygan, Leverkusen, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation
Filed July 2, 1963, Ser. No. 292,363
Claims priority, application Germany, July 9, 1962, F 37,267
2 Claims. (Cl. 18—12)



1. An apparatus for the manufacture of foils of thermoplastic material with beaded edges, which comprises a die for extruding a foil having a central web portion and a pair of oppositely disposed beaded edge portions, said die having a slot passage for extruding said web portion and a pair of marginal groove passages adjoining said slot passage and disposed in communication therewith for extruding said beaded edge portions, and a pair of oppositely disposed flow restricting members for regulating the outflow velocity of thermoplastic material extruded through each groove passage, each flow restricting member in each pair thereof having a smooth contoured bulbous portion disposed for extension into its associated groove passage to maintain the outflow velocities of thermoplastic material extruded through the outlets of each of said groove passages equal to each other and to the outflow velocity of thermoplastic material extruded through the outlet of said slot passage whereby the beaded edge portions and the web portion of said foil are extruded at a uniform rate, and the dimensions of said extruded web and beaded edge foil portions are established independently of extrusion outflow velocity by the outlet dimensions of said slot and groove passages.

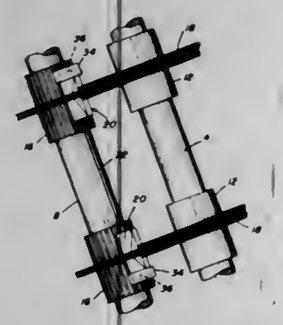
3,273,203
APPARATUS FOR FORMING PLASTIC SHEET MATERIAL
Frank A. Ross, Birmingham, Mich., assignor, by mesne assignments, to The B. F. Goodrich Company, New York, N.Y., a corporation of New York
Filed Mar. 12, 1962, Ser. No. 178,978
6 Claims. (Cl. 18—19)

1. Apparatus for depositing a softened sheet over a mold form comprising support structure comprising a body having a porous generally horizontal under surface and peripheral clamping means, means for selectively applying suction throughout said porous surface, means for selectively actuating said clamping means, and means for raising and lowering said clamping means and for raising and lowering said body independently of said clamping means.



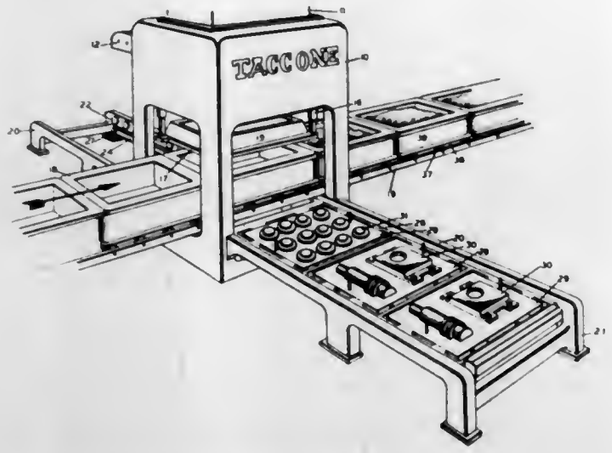
3,273,204
MOLD FOR THE MANUFACTURE OF LENSES
Charles Henry Craddock, Wexham, Slough, England, assignor to Combined Optical Industries Limited
Filed Nov. 18, 1963, Ser. No. 324,535
Claims priority, application Great Britain, Nov. 19, 1962, 43,621/62
4 Claims. (Cl. 18—34)

1. A lens molding device which comprises two die housings which during molding are brought together along a common axis, each housing having a bore for the reception of a lens molding die, the axis of which bore is



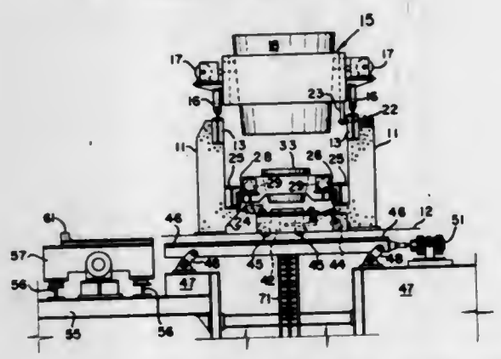
offset in relation to said common axis, and one of the housings being mounted in a frame for rotation about said common axis whereby the angle between the axes of the bores in the die housings, and hence between the axes of dies positioned therein, can be varied by rotation of said housing in the frame.

3,273,205
CASTING DEVICE INCLUDING A FLASH CAVITY DEFINED IN PART BY A GASKET ELEMENT
Michael A. Hanley, Shillington, Pa., assignor, by mesne assignments, to The Polymer Corporation, a corporation of Pennsylvania
Filed Oct. 18, 1962, Ser. No. 231,515
8 Claims. (Cl. 18—39)



1. In a device for casting plastic material comprising a mold having at least two separable parts, the improvement which comprises a gasket element positioned between the parting surfaces of said separable mold parts so as to define a flash cavity contiguous with the mold cavity defined by the separable mold parts.

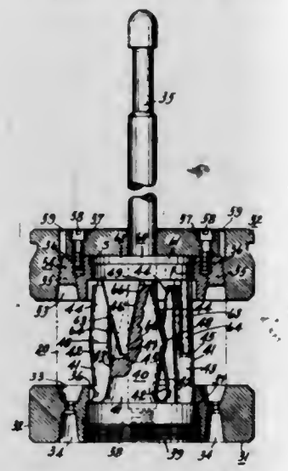
3,273,206
YARN CONDENSER FOR TEXTILE MACHINES
Robert L. Carroll, 401 McIver St., Greenville, S.C.
Filed Mar. 9, 1964, Ser. No. 350,451
4 Claims. (Cl. 19—288)



1. In a roving frame assembly for textile machines having a plurality of pairs of feed rolls for gripping and feeding a strand of yarn fibers therebetween during rotation of said rolls, the last pair of said feed rolls having a fluted roll cooperating with a rubber covered roll, and a yarn condenser positioned in advance of said last pair of feed rolls for bearing engagement with the surfaces of said last pair of rolls, the combination of a condenser body member formed with a yarn passage having a large open front end and tapering to a small open rear end for receiving a wide relatively loose strand of yarn and reducing the width of said strand of yarn for compacting the fibers in said strand as it passes through said yarn passage for subsequent feeding engagement between said fluted and rubber covered rolls, and bearing means mounted on said body member offset from said yarn passage having portions projecting beyond the surface of said body member for engaging the surface of said fluted roll to support said body member in spaced relation from said fluted roll and for reducing friction and wear on the surface portions of said fluted roll.

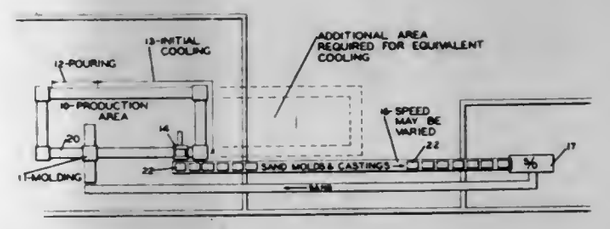
3,273,207
MACHINE FOR HANDLING PATTERNS
Russell W. Taccone, Erie, Pa., assignor to Taccone Corporation, North East, Pa., a corporation of Pennsylvania
Filed Mar. 26, 1964, Ser. No. 354,916
16 Claims. (Cl. 22—20)

1. A molding machine having a frame,
a pattern plate conveyor attached to said frame and extending on each side thereof,
a flask conveyor supported on said machine above said pattern plate conveyor and disposed generally at right angles to said pattern plate conveyor and extending on both sides thereof and having means to support a pattern plate both on each side of said flask conveyor,
a molding head on said machine supported above said flask conveyor and above said pattern plate conveyor,
a pattern plate carrier on said pattern plate conveyor,
at least two pattern plates on said pattern plate carrier,
means to index flasks on said flask conveyor to selectively stop individual flasks below said molding head,
means to move said pattern plates to bring them under said flasks at predetermined times,
and means to lift said pattern plates into engagement with said flasks and then to lift said pattern plates and said flasks into engagement with said molding head whereby sand in said flasks will be compressed.



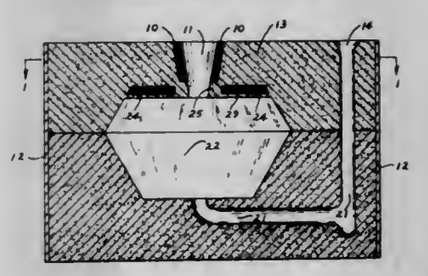
3,273,208
INTERCHANGEABLE CONTINUOUS CASTING APPARATUS
Joseph I. Greenberger, Pittsburgh, Pa., assignor to United Engineering and Foundry Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Sept. 19, 1963, Ser. No. 310,019
13 Claims. (Cl. 22—57.2)

1. In combination with a continuous casting machine employing a ladle and a mold, said mold being vertically movable relative to said ladle during operation of said machine,



a first means for supporting the mold in a pouring position,
a second means for supporting two molds in such a manner that the molds can be selectively positioned in said pouring position when said vertical movement of said mold is interrupted, and
means for bringing at least a part of the second supporting means into a supporting position with one of the molds when in the pouring position when said vertical movement of said mold is interrupted, thereby to allow the transfer of a mold from a supporting position with said first supporting means to a supporting position with said second supporting means.

3,273,209
ROTOR CONDUCTOR CASTING APPARATUS
Ellwood P. Herzog, Raymond C. Hoefling, and Albert B. Mewhinney, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 22, 1963, Ser. No. 282,416
3 Claims. (Cl. 22—58)

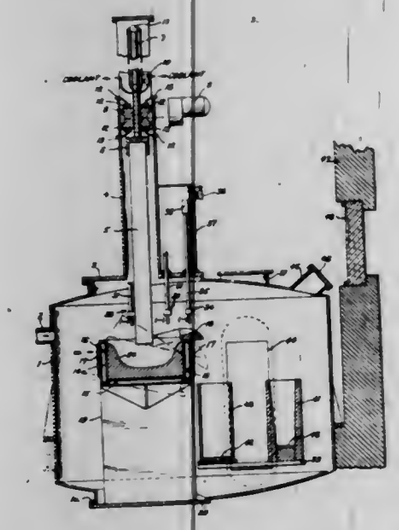


1. A casting die means for achieving a herringbone skew rotor lamination arrangement, comprising: a first moveable die casting die portion, having an annular end-ring-forming recess therein as well as carrying a plurality of fixed spaced axial projections adapted to receive slotted laminations and align a portion of said laminations, each said projection is located radially inward of said end-ring-forming recess and arranged concentric thereto, and each said projection has a leading edging defining one surface of said projection in a predetermined angular herringbone configuration, and each said projection has a second edging defining an opposite surface to that of said one surface, whereby said opposite surface is continuous along a plane and is substantially parallel to said one surface at a point from the die extending outwardly to substantially opposite the vertex of said herringbone configuration to align said portion of said laminations, said one surface and said opposite surface relatively converge into a taper form from a point opposite the vertex to the projection end; and a second moveable die casting die portion having an opposite annular end-ring-forming recess and a plurality of axial tapered probe means, located concentrically and inwardly thereof to complement said taper form at said second edging of said axial projections, respectively, whereby, when brought into operating engagement with said first die the probe means are adapted to simultaneously align the other portion of said laminations into said skew configuration by way of the slots when the relative coaction of the die portions result in each tapered probe means and the respective projection taper form completing said second edging into a trailing edging substantially parallel to the herringbone configuration of the respective leading edgings, and whereby the engagements of same are adapted to hold the laminations during a squirrel cage winding casting operation.

3,273,210
MACHINE FOR REMOVING MOLDS FROM FLASKS
Russell W. Taccone, Erie, Pa., assignor to Taccone Corporation, North East, Pa., a corporation of Pennsylvania
Filed Nov. 7, 1963, Ser. No. 322,104
10 Claims. (Cl. 22—95.5)

4. In a combination of machines,
a pouring station,
a cooling conveyor,
a punch out station,
said pouring station having means to receive flasks having sand molds formed therein and to pour molten metal thereinto,
platen means on one of said machines adapted to engage the sand in said flasks at the bottom thereof and to force it from said flasks after metal has been poured into said molds,
said cooling conveyor having an upper mold receiving surface substantially on a level with the bottoms of said sand molds when forced from said flasks,
and means to force said sand molds from said platen means to said cooling conveyor.

3,273,211
PROCESS OF MOLDING EXOTHERMIC COMPOSITIONS
Nick L. Miraldi, Bay Village, Ohio, assignor to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware
Filed Nov. 29, 1963, Ser. No. 326,992
5 Claims. (Cl. 22—193)



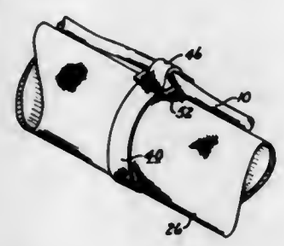
4. A process for the production of foundry molds equipped with exothermic riser sleeves which are formed in situ, said process comprising
(1) inserting a slightly-tapered, cylindrical plug into the top portion of the mold to form an annular space between the plug and the mold, said plug being supported on the pattern;
(2) filling and ramming the annular space with molding sand;
(3) withdrawing the plug and inserting a smaller, slightly-tapered, cylindrical plug into the cavity from which the larger plug was withdrawn to form an annular space between the plug and the wall of the cavity, said plug being supported on the pattern;

(4) forming an insulating shoulder by ramming the lower portion of the annular space with molding sand;
(5) filling and ramming the remainder of the annular space with green exothermic composition; and
(6) withdrawing the plug to complete the mold.

3,273,212
METHOD OF OPERATING AN ELECTRIC FURNACE

Robert J. Garmy, Canton, and Thomas E. Perry, North Canton, Ohio, assignors to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey

Original application Jan. 16, 1959, Ser. No. 787,266, now Patent No. 3,108,151, dated Oct. 22, 1963. Divided and this application Aug. 1, 1963, Ser. No. 299,306
3 Claims. (Cl. 22—200)



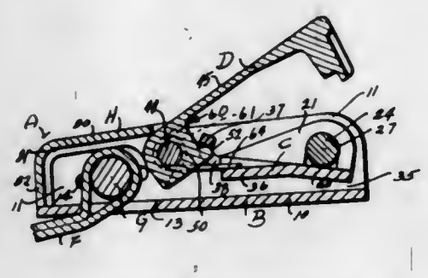
1. The method of forming an ingot of meltable charge material comprising:
(a) melting the charge material in a crucible by supplying electric current to the charge material through a consumable electrode of the meltable material;
(b) withdrawing the consumable electrode;
(c) advancing a non-consumable electrode;
(d) thereafter superheating the molten charge material substantially above its melting point by supplying electric current to the charge by means of the non-consumable electrode without adding further meltable charge material;
(e) withdrawing the non-consumable electrode; and
(f) pouring the superheated material into a mold.

3,273,213
REPLACEMENT OR REPAIR STRAP FOR EXTENSION CORD AND HARNESS ASSEMBLY

Edward W. Zurkowski, Stamford, Conn., assignor to Electrolux Corporation, Old Greenwich, Conn., a corporation of Delaware

Filed Apr. 13, 1964, Ser. No. 359,060
1 Claim. (Cl. 24—73)

A strap of elastic material adapted for supporting a length of an electric extension cord along the outer surface of a hose, said strap having inner and outer oppositely disposed surfaces arranged in back-to-back relation, said inner surface of the strap being adapted to contact the outer surface of the hose when said strap encompasses the hose, said strap having an enlarged portion intermediate its opposite ends, said enlarged portion having an aperture passing therethrough in a direction cross wise of the length of the strap, said strap having a slit therein which defines a narrow opening extending crosswise of the length of the strap and also extending from the inner surface of the strap into the aperture in said enlarged portion, said strap being temporarily deformable at said enlarged portion to cause said narrow opening to widen so that the cord may be passed through the widened narrow opening into said aperture and encompassed by said enlarged portion with said cord extending crosswise of the length of the strap, and an aper-

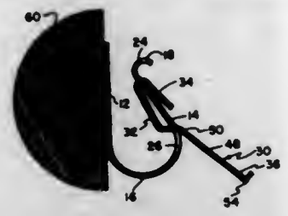


tured retaining member for maintaining said cord encompassed by said enlarged portion, said enlarged portion of the strap protruding through the aperture in the retaining member with said retaining member contacting the outer surface of the strap on opposite sides of said enlarged portion as well as contacting the side of the electric cord which is closest to the inner surface of the strap, said strap including means for fastening it in encompassing relation with the outer surface of the hose.

3,273,214
SAFETY BELT BUCKLE

Fred David Keeling, Cincinnati, Ohio, assignor to Irving Air Chute Company, Inc., Lexington, Ky., a corporation of New York

Filed Sept. 14, 1964, Ser. No. 396,051
4 Claims. (Cl. 24—230)

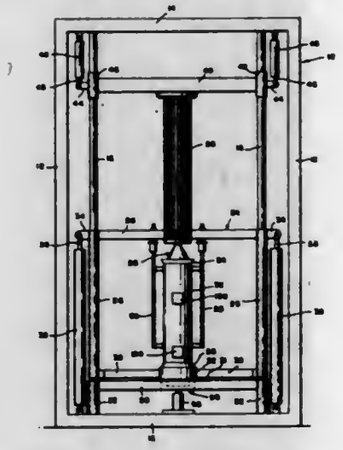


1. In a safety belt buckle construction the combination of a base portion, including a bottom wall and upstanding side walls, means at the forward end of the base portion for adjustable attachment of a safety belt thereto, a latching dog pivoted on the side walls adjacent the other end of the base, said dog comprising a plate portion positioned between the side walls, said plate portion at its forward end having a downwardly inclined dog-type ramp thereon, said latching dog being pivoted so that the plate thereof at its bottom surface is spaced a short distance from the top surface of the bottom wall, a flat belt attaching tongue having an opening therein, said tongue being of such thickness as to enable it to be slipped through said space between the latching dog plate and base bottom wall and when further inserted to ride beneath the ramp and lift the latching dog until the ramp-type dog drops into the opening of the tongue plate, lid means pivoted on said base side walls forwardly of said latching dog, means on the lid adjacent its pivot comprising a cam extension, and means on the latching dog against which the cam extension engages as the lid is raised to lift the latching dog and its ramp out of engagement in the opening of the tongue plate.

3,273,215
CLAMP FOR EAR ORNAMENTS

John C. Whitfield, Rte. 8, Topeka, Kans.

Filed July 14, 1964, Ser. No. 382,556
11 Claims. (Cl. 24—263)

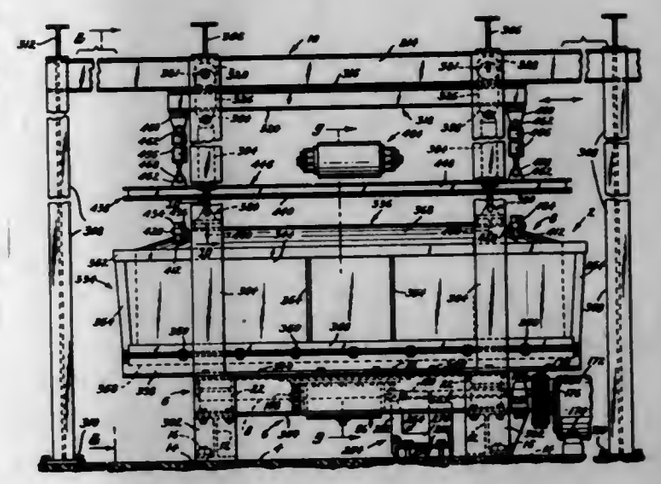


1. For use in a clamp, structure comprising an elongated member of generally rectangular transverse section, said member having a free end and being curved for a first portion of its length in one direction about its major transverse dimension adjacent its free end and being curved for a second portion of its length in the opposite direction about its major transverse dimension at a position remote from the free end thereof, said member being provided with longitudinally extending first and second slots through the minor transverse dimension thereof, said slots being longitudinally aligned and spaced from each other to define a web portion of the member therebetween, and with the remote ends of the slots being closed, said first and second slots respectively coinciding at least in part with the first and second curved portions of the member, and a clamping means carried by the member, said clamping means including a clamping foot disposed on one side of the member with respect to which the first and second curved portions of the member respectively curve away from and toward, first and second arms each having an end fixed to the clamp foot slidably extending respectively through the first and second slots, means at the end of the first arm for preventing displacement of the same from the first slot and for engagement against the outer concave side of the first curved portion to limit movement of the clamp foot in one direction, said second arm being engageable with the web on said one side of the member and having a length at least sufficiently great to extend through the second slot when the means at the end of the first arm is engaged to limit movement of the clamp foot in said one direction.

3,273,216
AUTOMATIC PIPE MAKING MACHINE

Larry C. Gourlie, Everett, Wash., assignor, by mesne assignments, to Graystone Corporation, Seattle, Wash., a corporation of Washington

Filed Dec. 10, 1963, Ser. No. 329,592
11 Claims. (Cl. 25—30)

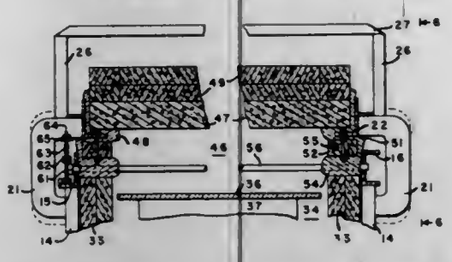


1. An apparatus for forming concrete pipe, comprising: (a) a supporting frame structure having a pallet station therein for receiving pallets to support a mold assembly, (b) a mold assembly including an outer mold casing and an inner mold core, said casing and said core defining a pipe molding cavity and said casing and said core being dependingly supported from a crosshead member, said crosshead member in turn being slidably connected to said frame for up and down movement thereon above said pallet station, said mold assembly also including a socket forming mold member located below said pallet station, said socket forming mold member being upwardly movable from below to above a pallet to a position concentrically within the lower end of said outer mold casing, said socket forming member having a rotatable upper portion for trowelling the socket section of concrete pipe in said mold, said rotatable portion also having a clutch means engaging the lower end of said core for imparting rotation to said mold core, (c) a hold-down tube member of a diameter larger than said mold core yet smaller than said mold casing, said tube member being capable of limited up and down movement and of being locked in contact position on the top end of a completed pipe in said mold assembly, (d) mold lift means attached to said crosshead member for upwardly withdrawing said mold casing and core while the completed pipe is held in place by said tube member, (e) compacting means attached to said mold assembly for facilitating settling of concrete mix introduced to said mold assembly, and (f) concrete supply means for delivering mix to said cavity in said mold assembly.

3,273,217
MOLDING APPARATUS INCLUDING A VIBRATION TABLE WITH SELECTIVE HORIZONTAL AND VERTICAL MOTION

Carl Wilmer Chanlund, Nampa, Idaho, assignor to Idaho Concrete Pipe Co., Nampa, Idaho, a corporation of Idaho

Filed June 11, 1965, Ser. No. 463,202
16 Claims. (Cl. 25—41)

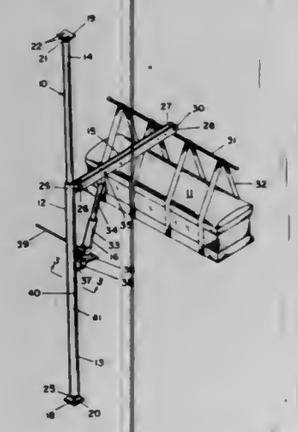


1. Apparatus for producing a molded product, comprising: a base; a vibration table for supporting a mold; means mounting said vibration table on said base, and arranged so that said table can vibrate in substantially any direction relative to said base; vibrator means secured to said vibration table and being operable in any selected one of a plurality of modes of vibration to vibrate said table, each operating mode of said vibrator means producing a direction of vibration different from that produced by the remainder of said plurality of modes; and control means arranged to coact with said vibrator means, and operable to change the mode of vibration of said vibrator means while the same is operating to vibrate said table.

3,273,218
KILN FOR RAPID FIRING SINGLE LAYERS OF CERAMIC ARTICLES

Ralph L. Byington, San Jose, Calif., assignor to Armrock Products, Inc., a corporation of California

Filed May 4, 1965, Ser. No. 453,121
7 Claims. (Cl. 25—142)

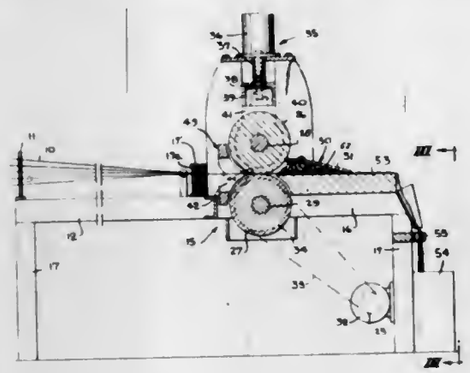


1. In a kiln for rapid firing of a single layer of ceramic articles such as glazed ceramic tile, an elongated firing oven comprising an upper fire brick construction and a lower fire brick construction, means separating said upper and lower fire brick constructions including a pair of journaling structures extending along each side of said oven, said structures being formed of a material having a different heat expansion characteristic than fire brick, heat insulating means for protecting each of said journaling structures from the heat of the oven, a series of journal means in each of said journaling structures, a series of parallel horizontal rollers journaled in said journal means of said structures, and extending through said oven and said insulating means, said rollers being in an intermediate position in said oven to provide a portion of said oven above said rollers and a portion of said oven below said rollers for direct heating of a ceramic article supported on the rollers and conveyed thereby through the oven, and means for driving said rollers to convey the ceramic articles through the oven.

3,273,219
PIVOTABLE POLE-TYPE LOAD LIFTING APPARATUS

Theodore W. Tuschen, Sun Prairie, Wis.

Filed Jan. 15, 1965, Ser. No. 425,889
3 Claims. (Cl. 27—27)

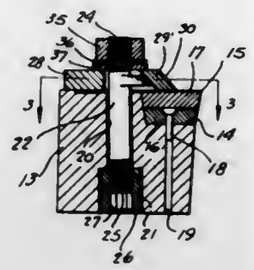


1. Body and casket lifting apparatus comprising:
(a) an adjustable upright floor-to-ceiling standard having axially aligned telescoping upper and lower tubular sections,
(b) said lower tubular section having a downwardly disposed smooth swivel pin mounted at its lower end and said upper section having an upwardly disposed smooth swivel pin mounted at its upper end,
(c) an upper member adapted to be secured to an upper supporting surface and having a downwardly opening recess therein for receiving said upwardly disposed swivel pin,
(d) a base member adapted to be located on a lower supporting surface and having an upwardly opening recess therein for receiving said downwardly disposed swivel pin,
(e) said upright standard being adapted to rotate 360° on said swivel pins,
(f) a lifting boom pivotably mounted on the lower section of said standard for movement about a horizontal axis,
(g) means for raising and lowering said boom.

3,273,220
APPARATUS FOR THE CRIMPING OF NATURAL AND SYNTHETIC TEXTILE MATERIALS

Nathan Rosenstein, West Hartford, Conn., and Abraham J. Rosenstein, New Marlboro, Mass., assignors to Spunize Company of America, Inc., Unionville, Conn., a corporation of Connecticut

Original application Sept. 19, 1960, Ser. No. 57,070, now Patent No. 3,164,882, dated Jan. 12, 1965. Divided and this application Nov. 9, 1964, Ser. No. 409,633
5 Claims. (Cl. 28—1)

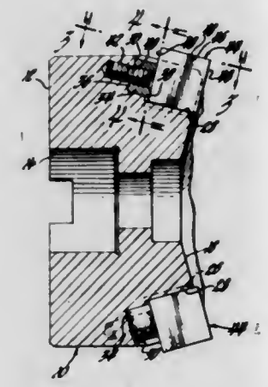


1. Apparatus for crimping a plurality of individual filament yarns and the like to form bulky crimped yarns therefrom comprising
(1) a pair of counter-rotary rollers located adjacent each other and having a common line of tangency forming a nip, the length of said rollers being at least sufficient to accommodate a plurality of yarns in a spaced apart web-like relationship,
(2) yarn guide means extending substantially throughout the length of said rollers, said guide means having spaced apart openings located adjacent the nip of said rollers and said openings being adapted to receive said plurality of individual filament yarns and to direct said yarns in web form in a spaced apart relationship between said rolers at the nip thereof,
(3) housing means adjacent the nip exit of said rollers forming a common crimping chamber for said web of yarns, said housing means having one dimension thereof sufficient that said web of yarns crimps therein while still in substantially said spaced apart relationship, whereby the individual yarns of said web crimp in multi-planar fashion with respect to the longitudinal axis thereof,
(4) pressure exerting means associated with said housing means substantially laterally coextensive therewith said one dimension, said pressure means and said housing means in combination being adapted to release said yarns from said housing means in response to the pressure of said yarns contained therein, and being adapted to release said yarns in the form of a web of crimped and bulked yarns arranged substantially according to the yarn spacing at the nip of the rollers, said released yarns being in an easily separable condition.

3,273,221
ADJUSTABLE CHIP-BREAKER

Harry R. Ewing, Rte. 1, Pleasantville, Pa. 16341

Filed Jan. 22, 1965, Ser. No. 427,441
7 Claims. (Cl. 29—96)

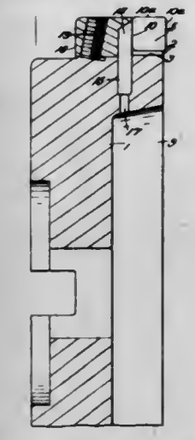


1. In combination, a tool holder provided with a cutter recess, a cutter disposed in said recess, said tool holder being formed with a vertical aperture adjacent said recess, a stud in said aperture, means to clampingly secure the stud in a vertically adjusted position in said aperture, a chip-breaker mounted on the tool holder and overlying the cutter, said chip-breaker comprising a plate-like main body formed with a longitudinal slot receiving said stud, one end of said slot having an inclined wall surface, and a lug on said stud received in said slot and cammingly engaging said inclined wall surface, whereby the chip-breaker is horizontally adjusted responsive to vertical adjustment of said stud.

3,273,222
CUTTING TOOL AND METHOD

John H. Begle, Northville, Mich., assignor to Futurmill, Incorporated, Southfield, Mich., a corporation of Michigan

Filed Mar. 6, 1963, Ser. No. 263,274
11 Claims. (Cl. 29—105)

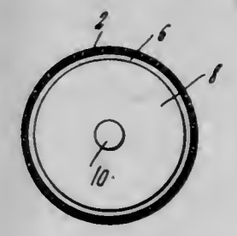


1. A cutting tool comprising a rotatable cutter body, means defining a plurality of cutter-blade receiving slots spaced about said cutter body and each including a seating surface, a plurality of locating members respectively mountable within said slots and each including a pair of spaced locating surfaces, one of said locating surfaces of each of said locating members being mountable in engagement with the seating surface of a respective slot and the other locating surface thereof being adapted to seat and locate a surface of a respective cutter blade, and mounting means rotatably adjustably mounting said respective locating members in said respective slots whereby, in the event of damage to a portion of a locating surface of a given locating member seating a cutter blade, said locating member may be rotatably indexed to a different rotary position to present an undamaged portion of said last-named locating surface to the cutter blade.

3,273,223
CUTTING TOOLS

Walter Henry Wright, Sheffield, England, assignor to Firth Brown Tools Limited, Yorkshire, England, a British company

Filed Feb. 19, 1964, Ser. No. 346,033
Claims priority, application Great Britain, Feb. 19, 1964, 6,708/63
2 Claims. (Cl. 29—105)

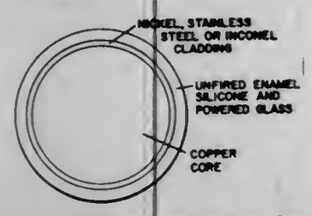


1. A milling cutter comprising in combination a rotatable body, a peripheral rib around said body, a plurality of separately constructed cutting blades held respectively in a like number of longitudinal slots each passing completely through said rib, each of said blades having along at least one side thereof a cutting edge projecting from one side of the rib and each blade being positioned, as to its cutting edge, by a separately constructed pin of circular cross-section, a portion of the longitudinal surface of each of said pins positioning and supporting a side of the associated blade at the other side of the rib, said pins being inserted respectively within bores of corresponding diameter provided in the body and being disposed respectively adjacent and parallel to substantially the full length of the said blade sides and in line contact therewith, and a separately constructed ring shaped for releasable attachment to said body and disposed around the body adjacent said rim so as to lie in supporting engagement with said pins.

3,273,224
DAMPENING ROLL COVER

Ronald F. Spicer, Walpole, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts

Filed Oct. 10, 1963, Ser. No. 315,328
2 Claims. (Cl. 29—120)



1. A tubular elastic dampening roll cover including elastic yarns held under tensioned radial extension by a dried impregnation with a substance which has a dry modulus of rigidity sufficient to counteract the retractive tendency of the tensioned elastic yarns in said cover, whereby said cover is maintained in an out-size condition while in the dry state, said substance being water-softenable but not readily water-soluble and having a modulus of rigidity when wet which is insufficient to counteract the retractive tendency of said elastic yarns in said dampening roll cover.

3,273,225
METHOD OF MAKING ELECTROMAGNETIC STRUCTURES FOR HIGH-TEMPERATURE SERVICE

Harry L. Saums, North Muskegon, and Wesley W. Pendleton, Muskegon, Mich., assignors, by mesne assignments, to Anaconda Wire & Cable Company, a corporation of Delaware

Filed Feb. 14, 1962, Ser. No. 173,115
26 Claims. (Cl. 29—155.57)

1. The method of manufacturing an insulated electromagnetic winding capable of operation at temperatures above 300° C. which comprises applying to a conductor a flexible abrasion-resistant insulation comprising a covering of inorganic dielectric material bonded in place by an organic varnish, forming the thus-insulated conductor into a winding, heating the winding to a temperature above the pyrolysis point of the organic varnish for a sufficient period of time to pyrolytically volatilize all organic matter from the covering and leave the formed winding insulated solely by the inorganic dielectric material.

3,273,226
METHOD FOR SECURING STRUCTURES IN PRECISE GEOMETRIC RELATIONSHIP

Jack Brous, Livingston, N.J., William A. Conrad, New York, N.Y., and William G. Poelstra, Paterson, N.J., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Army

Filed Feb. 19, 1965, Ser. No. 434,149
9 Claims. (Cl. 29—155.5)

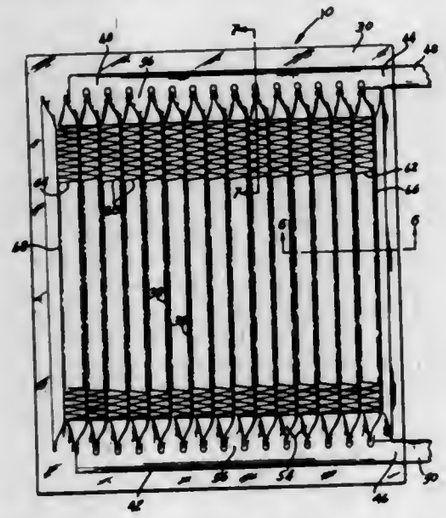
1. The method for constructing a helix assembly comprising the steps of

winding a wire in a prescribed helical configuration on a support,

placing longitudinal masking details around the helix and the support and exposing longitudinal strips thereof,

coating said helix and support with a ceramic material to a thickness such that the helix and support are imbedded in said ceramic material, and removing said masking details and said support.

3,273,227
FABRICATION OF HEAT EXCHANGE DEVICES



Theron F. Pauls, Madison, Ill., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia

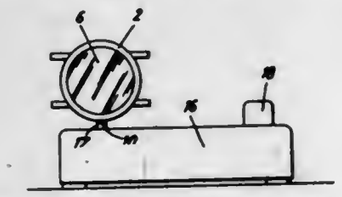
Filed June 12, 1963, Ser. No. 287,240
3 Claims. (Cl. 29—157.3)

1. A method of fabricating a heat exchange device comprising the steps of

(A) providing a composite sheet formed of two superposed planar sheets having a pattern of weld preventing material interposed between said sheets, said composite sheet having opposed first edges and opposed second edges, said pattern including a pair of parallel spaced apart bands located adjacent said first edges and extending to one of said second edges and a plurality of closely spaced apart bands lying parallel to said second edge and joined at opposite ends with said pair of bands, said pair of bands and plurality of bands thereby defining islands free of said weld preventing material,

(B) pressure rolling said composite sheet in a direction parallel to said closely spaced apart bands to unify said composite sheet except in the areas of said pattern of weld-preventing material and to effect a differential in reduction of thickness of said composite sheet between the intermediate portion thereof defined by said plurality of bands of weld preventing material and material free islands, and the remaining outer portions of said composite sheet, with said intermediate portion being subjected to a greater reduction than said outer portions,

(C) slitting said composite sheet in said weld preventing material free islands over a major portion of the length thereof to provide a plurality of individual strips of said composite sheet,



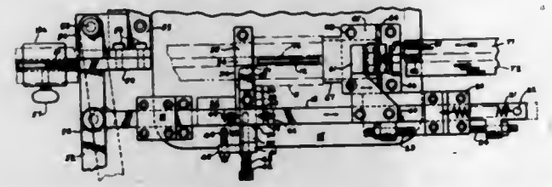
(D) bending said strips adjacent the opposite end portions thereof in a rotary direction relative to the longitudinal axis of said strips by approximately 90° to displace the elongate portion of said strips between said end portions out of the normal plane of said composite sheet, thereby forming elongate apertures between adjacent confronting surfaces of said strips, and

(E) forming a system of internal passageways within said composite sheet corresponding to said pattern of weld preventing material by applying thereto a fluid under pressure to expand the areas of said composite sheet covered with said weld preventing material.

3,273,228
METHOD FOR OPENING A WATCHCASE

Ernest Morf, Vaudijon, Colombier, Neuchatel, Switzerland

Filed July 1, 1963, Ser. No. 292,025
Claims priority, application Switzerland, July 4, 1962, 8,044/62
5 Claims. (Cl. 29—177)



1. A method for opening a watchcase tightly closed by a cover member fitting a lodging of a watchcase body member, comprising the steps of connecting the watchcase cavity to an air chamber having a predetermined volume, and urging the air from said chamber to said cavity, the predetermined air volume of said chamber thereby producing inside the watchcase a pressure increase strong enough to cause the cover member thereof to jump out of its lodging.

3,273,229
REGISTERING DEVICE FOR GAP SPACING

Donald O. Taylor, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut

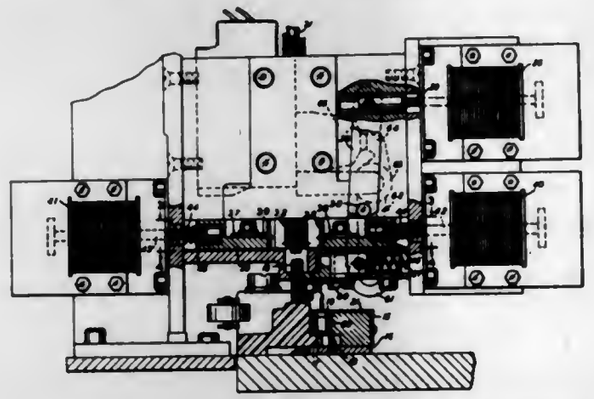
Filed Dec. 4, 1964, Ser. No. 416,037
6 Claims. (Cl. 29—200)

1. In a machine for cutting gaps in continuous zipper chain having two interlocked plastic filament coils, the combination of

(a) coil cutting tools;

(b) means for guiding the zipper chain between said cutting tools;

(c) a stop against which the leading end of the zipper chain may be placed to locate the chain in approximately the desired cutting position;



(d) a transverse slide mounted closely adjacent said cutting tools and having projecting means on its end adapted to move between a pair of adjacent coil convolutions for more precisely locating the chain in relation to the cutting tools; and

(e) means for operating said transverse slide into and out of engagement with one of the coils of said zipper chain.

3,273,230
APPARATUS FOR DISPENSING WASHERS

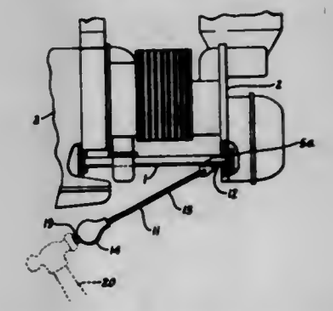
George P. Adams, Baltimore, Md., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed Aug. 30, 1963, Ser. No. 305,738
12 Claims. (Cl. 29—211)

1. A device for dispensing predetermined numbers of substantially flat articles, comprising:

means for vertically stacking a plurality of substantially flat articles,

a slide mounted for displacement selectively in a plurality of directions below the vertical stack of the articles in the stacking means, said slide having a neutral nondispensing position in which position said slide retains the articles on the vertical stacking means,



a plurality of elements associated with the slide and spaced different predetermined distances above the bottom of the stack of articles supported by the slide, and

means for displacing the slide selectively in any of a plurality of different directions from the neutral nondispensing position to insert selectively any of the elements above different predetermined numbers of articles in the stack of articles so as to support the articles above the element in the vertical stacking means while permitting selectively predetermined numbers of articles below the element to fall from the vertical stacking means.

3,273,231
TUBE REMOVAL TOOL

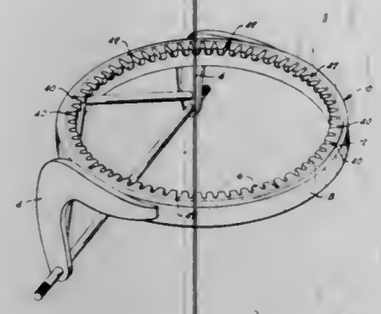
Walter J. Andrews, 250 Lincoln St., Apt. C, Redwood City, Calif.

Filed May 18, 1964, Ser. No. 367,965
1 Claim. (Cl. 29—275)

A tool comprising an elongated, semi-cylindrical, thin-walled sleeve portion having a square distal end, a clevis having a central portion and parallel arms normal to said central portion, said arms spaced apart a distance slightly less than the diameter of said sleeve, said central portion affixed to said sleeve portion adjacent the proximal end of said sleeve portion, a pin passing through said arms of said clevis, said pin laterally offset from said sleeve portion and normal to said arms of said clevis, and a tap rod having an aperture formed at one end, said pin passing through said aperture, said pin having a diameter substantially smaller than the diameter of said aperture, said tap rod longitudinally and transversely pivotally attached to said pin, whereby said rod is capable of assuming random askew angles relative to said pin and whereby tapping force applied to the end of said rod remote from said sleeve is transmitted to said distal end in a direction parallel to the axis of said sleeve with said rod pivoted at a variety of angular positions and askewed at a variety of angular positions relative to said sleeve.

3,273,232
METHOD FOR REPLACING WORN OR FRACTURED TEETH ON LARGE GEAR RINGS

Clady J. Royer, 2645 NW. 26th St., Oklahoma City, Okla.



Filed Oct. 21, 1965, Ser. No. 499,200
11 Claims. (Cl. 29—401)

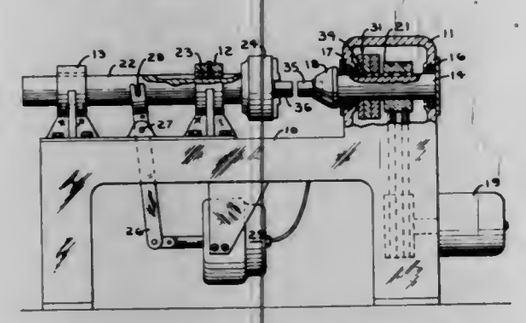
1. A method of replacing worn gear teeth on a gear circle of the type having an annular metallic member enclosing a free, unobstructed space, said annular metallic member having radially inwardly extending gear teeth at the inner periphery thereof, said method comprising:

forming a plurality of toothed, metallic arcuate segments each having an outer periphery having a radius of curvature greater than the radius of curvature of a circle drawn through the points of connection of the teeth of said gear circle to said annular metallic member, each of said segments having teeth of identical pitch to those carried by said gear circle, and

said segments collectively forming a circle when placed in substantially end-to-end relationship to each other;

cutting away all of the gear teeth from said gear circle by cutting through said gear circle along an annular reference line having a radius larger than the radius of curvature of the outer periphery of said arcuate segments;

positioning said arcuate segments in end-to-end circular array inside the outer peripheral portion of said gear circle in place of the removed inner peripheral portion thereof; and



securing said arcuate segments to said outer peripheral portion of the gear circle while maintaining the circular array of said segments.

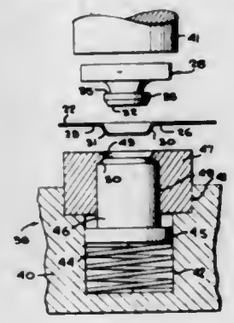
3,273,233

METHOD OF BONDING METAL WORKPIECES

Theodore Loring Oberle, Washington, Marion Roy Calton, East Peoria, Calvin David Loyd, Peoria, and Claude Foster White, Creve Coeur, Ill., assignors to Caterpillar Tractor Co., Peoria, Ill., a corporation of California

Filed Oct. 27, 1964, Ser. No. 407,955
20 Claims. (Cl. 29—470.3)

8. The method of bonding metal workpieces by using a flywheel to control the process and comprising, storing in a rotating flywheel coupled with and driving a first workpiece all of the energy required to bond the workpieces, applying pressure to force a surface of said first workpiece into rotational rubbing contact with a surface of a second workpiece, continuing said rotational rubbing contact to heat said surfaces to a plastic condition and a bondable temperature at the pressure applied until said surfaces bond and the stored energy of the flywheel is expended, and predetermining the duration of such rotational rubbing contact between said surfaces by the amount of energy stored in the flywheel.



15. A method of bonding engaged surfaces of metal workpieces across a common interface including, engaging the surfaces in rotational rubbing contact under pressure and at a speed above a critical speed for a sufficient amount of time to heat the interface to a plastic condition and a bondable temperature, decreasing the speed below the critical speed to from the bond as the speed passes through the critical speed, and working the bond zone at a speed below the critical speed and while the material in the bond zone is plastic by turning the workpieces through more than about ¼ revolution of relative rotation to forge and to eject coherent flash from the bond zone.

3,273,234

APPARATUS FOR AND METHOD OF ASSEMBLING A PLASTIC PULL TAB WITH A METAL TEAR STRIP

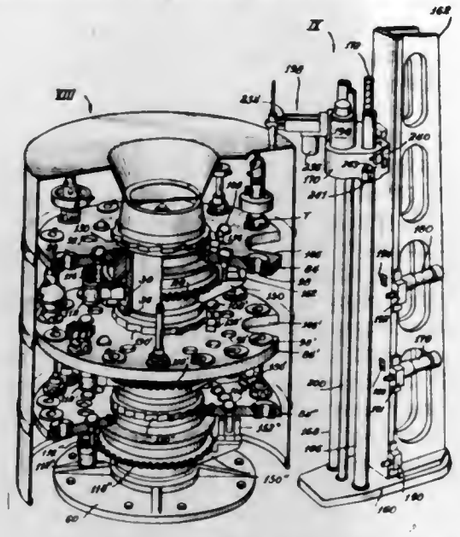
John Henchert, Oak Park, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York

Original application Feb. 10, 1961, Ser. No. 88,473, now Patent No. 3,151,766, dated Oct. 6, 1964. Divided and this application June 19, 1963, Ser. No. 289,075
4 Claims. (Cl. 29—453)

1. An apparatus for assembling a pull tab having a resilient plug portion and a tear strip having a flanged opening therethrough, said apparatus comprising a die ring having an upper surface for supporting the tear strip and a recessed flange supporting seat, an opening in said die ring below said seat and a spring loaded ejector in the die ring opening, said die ring opening having an annular release portion beneath said seat to both form a stop for said ejector and provide an expansion area for a lower part of said pull tab plug portion projecting beneath said seat whereby the plug portion will necessarily be allowed to expand after it passes through and below the seat, and a punch aligned with said die ring and being movable towards and away from said die ring.

2. A method of assembling a pull tab having a resilient plug portion and a tear strip having a flange opening for receiving the plug portion, said method comprising the steps of supporting the tear strip including the supporting of the flange defining the flanged opening, snap-fitting the lower part of the plug portion through the flanged opening while continuing to support the flange, resiliently engaging the plug portion as it passes through the flange and then utilizing the resilient engagement with the plug portion to remove the assembled pull tab and tear strip from the support therefor.

3,273,235



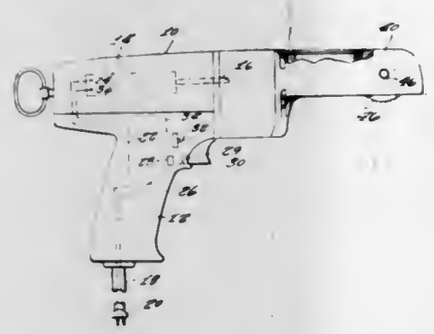
AUTOMATIC TOOL CHANGING APPARATUS

Harry R. Dziedzic, Glenview, Ill., and Richard A. Jerue, Birmingham, Mich., assignors to Scully-Anthony Corporation, a corporation of Illinois

Filed May 11, 1964, Ser. No. 366,443
12 Claims. (Cl. 29—568)

1. For use in an automatic tool changing system for a machine tool, in combination, a first tool storage tier member having a plurality of tool holding means thereon for holding a first group of tools in vertically disposed positions, a second tool storage tier member having a plurality of tool holding means thereon for holding a second group of tools in vertically disposed positions, said first and second tiers being mounted one above the other for rotation about a common vertical axis, means for rotating said tiers to bring a selected tool therein to a predetermined tool change position corresponding to the tier in which the selected tool is located, vertically movable

shuttle means common to said first and second tiers including gripping means for gripping a selected tool in a tool change position in one of said tiers and transferring the same therefrom, said gripping means being rotatable about a horizontal axis, means responsive to the location of a selected tool for moving said shuttle to an operative



vertical position adjacent the particular tier in which a selected tool is located, and means operative after said selected tool has been moved away from said tier member by said shuttle for rotating said gripping means about said horizontal axis so as to dispose said selected tool in a horizontal position.

3,273,236

ELECTRICALLY OPERATED CUTTER FOR CUTTING THE ARMOR OF ARMORED CABLE

William A. McDowell, 266 Randolph Ave., Emerson, N.J.

Filed June 5, 1964, Ser. No. 372,767
1 Claim. (Cl. 30—90.5)

An electrically operated cutter for cutting the armor of armored cable comprising:

a first casing;

an electric motor in the first casing and having a drive shaft connected thereto;

a pistol griup depending downward from the first casing;

a trigger switch mounted in the pistol grip;

means for feeding electrical energy to the electric motor and the switch such that closing the switch energizes the electric motor and rotates the drive shaft;

a second casing attached to the first casing such that the drive shaft extends into the second casing;

there being positioned in the second casing:

a first bevel gear mounted on the drive shaft;

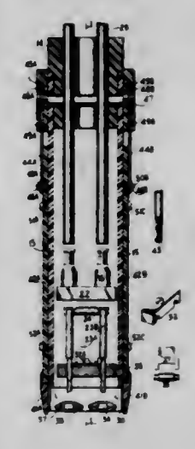
a shaft extending transversely of the drive shaft;

a second bevel gear mounted on the shaft and engaging the first bevel gear such that the shaft rotates when the electric motor is energized;

a circular cutting wheel secured at its center to one end of the shaft such that it rotates in a plane parallel to the axis of the drive shaft when the shaft rotates;

a plate having two ends and a slot therein, affixed at one end thereof to the bottom of the second casing;

a portion of the circular cutting wheel projecting downward through the slot;



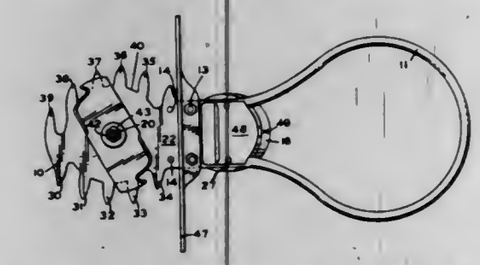
means for moving the other end of the plate toward and away from the second casing while the one end remains affixed to the casing such that the portion of the circular cutting wheel projecting downward through the slot varies to thereby vary the depth of cut of the circular cutting wheel in the armor of the armored cable.

3,273,237

VACUUM AIDED AND CABLE DRIVEN HAIR CLIPPER

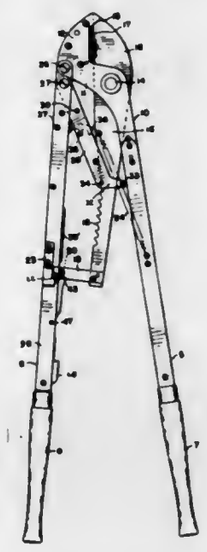
Frank Lee Barcaskey, 948 1st Ave., Coraopolis, Pa.

Filed Apr. 24, 1964, Ser. No. 363,071
2 Claims. (Cl. 30—133)



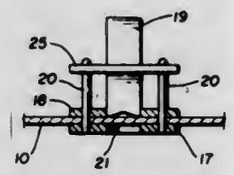
1. A clipping device comprising quadrangular portions of tubing joined to form an elongated housing having a base portion at one end defining an inlet, with two or more stationary shear plate blades disposed horizontally across said inlet, a slidably movable shear blade mounted against each of said stationary blades and cooperating therewith, spring elements exerting tension upon intermediums to thereby maintain suitable pressure upon each of said movable blades, a transmission assembly comprising two or more precisioned shafts rotably journalled to lie parallel to and within the central-most portion of housing, means connecting each said transmission assembly to each said movable blade, a plurality of flexible driving cables entering the uppermost end of said housing and drivingly engaging said shafts, an enterjoining portion of housing defining an exit, with said portion of housing acting as mounting means for vacuum escape tube plus said flexible cables, a sliding adjustable casing comprising two sheets of synthetic material, each of said sheets being bent approximately ninety degrees and fitted to encase the quadrangular tubing in which the shear blades and transmission assembly are disposed, resilient means securing the two sheets of said casing together, a shaft transfixed through said uppermost end of said housing and rotably mounting a pair of dial-like knobs, means connecting said dial-like knobs to said casing whereby rotation of said knobs causes sliding movement of said casing, a plurality of comb-like members formed at the inlet end of said casing and projecting beyond said shear blades positioned in said inlet.

3,273,238
PLIERS HAVING A CAMMING LEVER MEMBER TRAPPED BETWEEN JAW MEMBERS
Carl Kuhbier, 4 Bussardweg,
Munster-St. Mauritz, Germany
Filed Dec. 10, 1964, Ser. No. 417,303
5 Claims. (Cl. 30—189)



1. A pair of pliers comprising, in combination, two elongated jaw members each having a jaw portion at one end and a power arm at the other end, one of said jaw members having a handle portion forming a continuous of said power arm of said one jaw member and extending in a direction opposite to the jaw portion from said power arm of said one jaw member, said power arms overlapping each other at least in part and defining a free space between facing surfaces thereof; pivot pin means connecting said jaw members intermediate the ends thereof to each other; said jaw members being rotatable about the axis of said pivot pin means; a one-arm lever member having an end portion located in said space between said facing surfaces of said power arms; a first pivot pin projecting from the region of the free end of said lever member which is located between said power arms to one side of said lever member through an opening in said handle portion; a second pivot pin projecting to the other side of said lever member from a portion thereof located between said first pivot pin and the other end of said lever member through an opening in the power arm of the other jaw member, one of said openings being cylindrical and the other being in the form of an elongated slot, at least one of said pivot pins being in the form of a projection integral with said lever member, said pivot pin means forming the only means for securing said jaw members and therewith also holding said lever member captive in the space between said power arms of said jaw members.

3,273,239
MACHINE HAVING MULTIPLE CUTTING ACTION FOR CUTTING DIFFERENT TYPES OF PLANT STEMS AT THE SAME TIME
Rowland M. Hill, 1718 W. 12 Mile Road,
Royal Oak, Mich.
Filed Sept. 17, 1964, Ser. No. 397,161
5 Claims. (Cl. 30—206)



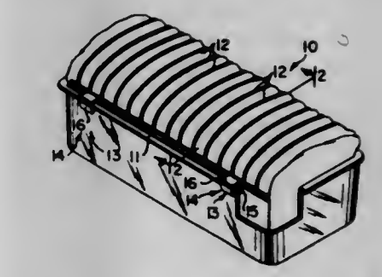
1. A machine for cutting stems of various size and toughness comprising,
a substantially annular plate having an axial aperture,
a shaft rotatably positioned in said plate aperture,
a relatively wide substantially rectangular blade on said shaft;
said shaft and said blade rotating relative to said plate;
said plate having a semicircular section;
spaced support teeth on said plate in said semicircular section lying parallel to one another in a curving conformation;
a cutting edge on said blade lying at a back angle to the radial extending beyond said plate into the location of said support teeth;
an outer curving end portion on said blade trailing said cutting edge,
an inner curving end portion on said blade in advance of said cutting edge, and
a nosetooth at a back angle to the radial on said blade at the juncture of said cutting edge and said outer curving end portion on said blade;
said device having a cutting feed direction parallel to said support teeth on said plate;
said nose tooth cutting a groove in large stems by rapidly removing small chips with said nose tooth back angle moving the stem into said tooth and said outer curving end portion, said blade abutting a large stem and permitting only small advances of the large stem into said nose tooth preventing over feeding;
said backed angle nose tooth and cutting edge on said blade moving medium size and small stems into the location of said cutting edge on said blade;
said cutting edge on said blade lopping-off medium size stems and small stems of average flexibility;
said cutting edge on said blade bending small stems of great flexibility against said support teeth;
said support teeth holding small stems of great flexibility against flexing movement;
said cutting edge on said blade cutting off small stems of great flexibility as positioned and supported by said support teeth.

3,273,240
CUTTING TOOL
Steuart R. Florian, 1551 Griffin Road, P.O. Box 682,
Dania, Fla.
Filed May 11, 1964, Ser. No. 366,564
4 Claims. (Cl. 30—251)

1. A cutting tool for cutting shrubbery and tree limbs that comprises first and second elongated handles, one handle at its upper end being acutely angled to form an offset head portion that terminates in a cutting jaw, the second handle being pivotally connected to the head, a fulcrum bar that is pivotally connected to the head at the point of offset from the first named handle, the said bar terminating upwardly from its pivot to define a cutting jaw, the bar projecting downwardly from its pivot and having one edge provided with ratchet teeth, spring means for biasing the bar in a direction toward the first named handle, a pawl pivotally connected to the second handle and having its lower end bifurcated to engage the fulcrum bar, the pawl being biased toward the bar, latch means carried by the second handle for maintaining the pawl in an inoperative position, a latch carried by the second handle and a yoke carried by the bar that is engageable with the latch whereby the handles are held in inoperative position, the said latch when released permitting the handles to be swung toward and from each other for actuating the jaws to cut relatively thin stock and roller means carried by the lower end of the pawl that rides upon a free edge of the bar when the pawl is in a latched position.

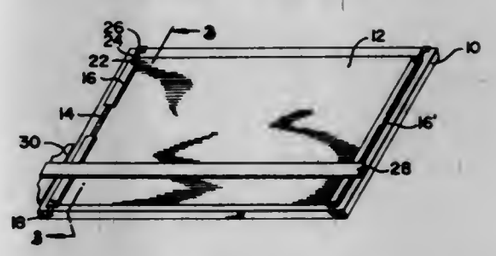
3,273,241
PORTABLE PANEL PUNCHING TOOLS
Townsend Annes, 1550 Detroit, Apt. 3E,
Denver, Colo.
Filed Sept. 16, 1965, Ser. No. 487,873
3 Claims. (Cl. 30—360)

1. A punching tool, for punching a rectangular opening between two screw holes in a panel, comprising:
(a) a die block having a shearing opening corresponding in shape to the desired rectangular opening and adapted to be positioned against one face of said panel;
(b) a guide pin fixed in said die block at each side of said shearing opening and adapted to be inserted through the screw holes in said panel so as to project perpendicularly from the other face of said panel in parallel relation;
(c) a punch-aligning plate having an aligning opening corresponding to said shearing opening and pin openings to receive said projecting pins and adapted to be positioned against the other face of said panel with said pins acting to maintain the aligning opening and the shearing opening in alignment with each other; and
(d) an elongated punch corresponding in cross-section to said aligning and shearing openings adapted to be inserted in said aligning opening and driven through said panel into said shearing opening.



3,273,242
DENTAL CROWN AND METHOD OF PRODUCING THE SAME
Vladimir Andrew, 3 Bld. d'Anvers, Strasbourg, France
Filed Apr. 11, 1961, Ser. No. 115,585
Claims priority, application France, Apr. 13, 1960,
6,890, Patent 1,254,171
8 Claims. (Cl. 32—12)

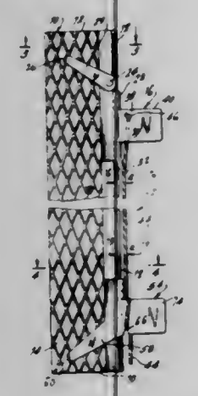
1. An aesthetic dental crown for patient's tooth stumps, comprising an inner metal wall adapted to cap and to be sealed over the tooth stump to be crowned, an outer apparent wall secured over the inner wall, said outer wall including a metal section over the rear surface of the inner wall, a gap between the metal section and the inner wall, and a section of a material having the natural color



of the patient's teeth and extending over the front surface of the inner wall.

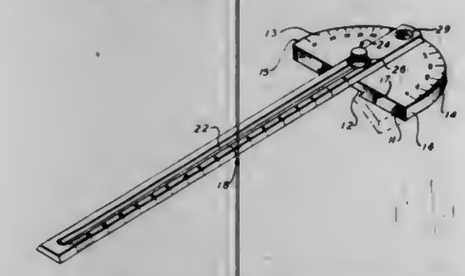
3,273,243
BREAD MARKING DEVICE
Joseph M. Lind, 400 N. Sycamore St.,
Los Angeles, Calif.
Filed Oct. 23, 1963, Ser. No. 318,245
8 Claims. (Cl. 33—1)

1. An inexpensive bread-marking device adapted to form shallow grooves in and conforming to the upper surface of a loaf of bread being formed by baking a mound of dough without substantially restricting the expansion of said dough mound or its contact with its environment, comprising a pair of spaced, parallel anchor rods, a series of spaced, parallel arches extending between said anchor rods, said arches being curved to conform to the upper surface of a loaf of bread being formed by baking a mound of dough, and a set of spring clamps adapted to attach said device to the top of a bread pan.



3,273,244
DRAWING PROTECTOR
Albert O. Goenner, 9300 Old Georgetown Road,
Bethesda, Md.
Filed July 15, 1965, Ser. No. 472,090
12 Claims. (Cl. 33—75)

1. A drawing protector adapted for use with a drafting board, comprising a thin, flexible member of predetermined length and attaching means disposed on opposite longitudinal ends thereof, said drawing protector having

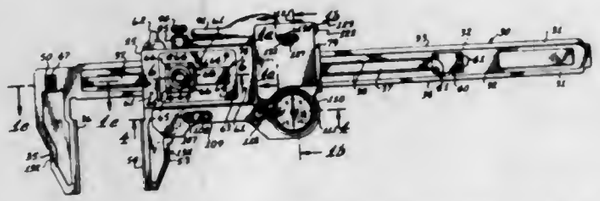


an arcuate cross-sectional configuration whereby a portion of the drawing protector may be readily flexed from an arcuate disposition to a flat disposition.

3,273,245
DEVICE FOR INSTALLING CORNER BEADS AND THE LIKE
Charles Brodsky, 2944 W. 5th St., Brooklyn, N.Y. 11224
Filed Sept. 18, 1964, Ser. No. 397,588
11 Claims. (Cl. 33—85)

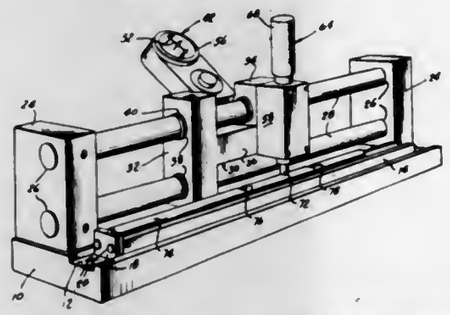
1. A plumb line bracket for a lath corner bead, said bracket comprising an elongated body portion, guide locating means provided on said body portion for engagement with the corner bead portion of said lath corner bead, and a rooked arm pivotally mounted on one end of said body portion for engagement with the lath portion of said lath corner bead.

3,273,246
ADJUSTABLE T-SQUARE
Alfred W. Siberini, 221 Ivy St., Kearny, N.J.
Filed June 29, 1964, Ser. No. 378,699
10 Claims. (Cl. 33—101)



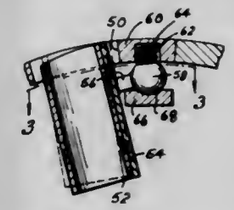
1. An adjustable T-square comprising a head flat on one side, with one edge straight, a blade associated with said head for completing the T-square, said head having a threaded aperture, extending from one face to the other, lying halfway between its ends, said blade having a slot closed at both ends and of width corresponding with the diameter of said aperture, a thumb screw with a threaded shank fitted through said slot and into said aperture for holding said blade in place with respect to said head, the other side of said head having a groove of section corresponding with that of said blade and into which the latter fits when removed from said screw, reversed and slid along the other side of said head, said groove being defined by side edges parallel to a plane through the axis of said aperture and perpendicular to said straight edge and said screw being removable and reinsertable in the head from the opposite face to hold the blade in place, so that said blade when so held in the groove will always be square with respect to the the groove therein and through the slot to hold the blade straight edge of the head.

3,273,247
MULTISCALE ENGINEERS SCALE
Ronald O. Bergerson, 2212 E. 86th St., Apt. 22, Minneapolis, Minn.
Filed Mar. 30, 1966, Ser. No. 538,805
4 Claims. (Cl. 33—107)



1. A multiscale engineers scale comprising, in combination, a substantially elongated housing member, said member having a transversely positioned slot therein, the bottom portion of said member assuming a concave form, an elongated metallic plate, a plurality of graduated markings on both sides of said plate, said plate being of a convex shape, an elongated bottom member, the top portion of said bottom member having a convex configuration and thereby providing means for sliding said plate on said bottom member, a plurality of graduated markings on both sides of said bottom member, a grasping member secured to said plate, said grasping member positioned within said slot of said housing member in such a manner that it provides means for laterally moving said plate to any side of said bottom member thus substituting said markings of said plate for said markings of said bottom member, and means for securing said housing member with said bottom member without interfering with the lateral movements of said elongated plate.

3,273,248
HIGH PRECISION CALIPER GAGE
Carl D. Halverstadt, Corona, Calif., assignor of fifty percent to Arthur L. Rothfeder, Scottsdale, Ariz.
Filed Sept. 14, 1964, Ser. No. 396,433
4 Claims. (Cl. 33—147)

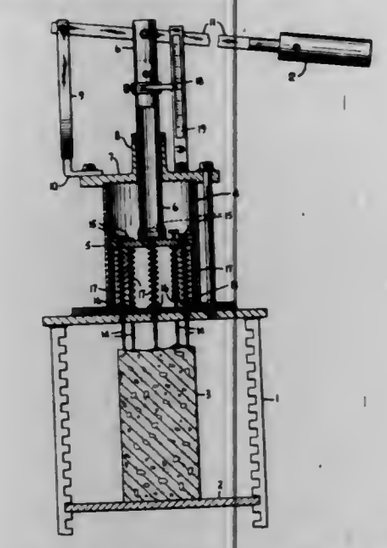


1. A high precision caliper gauge comprising in combination:
(A) a straight parallel sided body having an I-shaped cross section for maximum moment of inertia per unit mass in the direction of gauge loading,
(B) a jaw fixed to said body with a contacting face at right angles to said body with an I-shaped cross section bending into the body I-section for maximum moment of inertia per unit mass,
(C) a movable jaw having an integral portion movable on said body to relatively position said jaws to each other including a section for encompassing and engaging with two basic inner faces a side of said body and three other faces engaging an adjacent side with two opposing faces and a gib with two faces opposing the first two faces,
(D) a dial indicator carriage on said body and movable on said body relative to said movable jaw portion having two inner faces engaging with said body opposed by a spring force to enable movement maintaining constant contact with said body with adjacent internal side faces maintaining a lesser contact with said body,
(E) means for clamping and releasing said dial indicator carriage on said body comprising a carriage lock member having a toggle joint clamping action and a U-shaped member transmitting the force from a spring transmitted into a carriage lock member with two internal faces in the same plane transferring said force to one side of said parallel sided body with opposing force being transferred to the opposite side by a U-shaped member with an internal surface adjacent to the two sides so that the clamping force extends on the opposite side of the parallel sided body and is located between said other points,
(F) means providing limited positive movement between said dial indicator carriage and said movable jaw shank including thumb screw adjustment with a carriage lock member being connected to the dial indicator carriage and a threaded thumb screw providing positive adjustment between said dial indicator obscured in the dial indicator carriage and the movable jaw,
(G) a dial indicator fixed in said dial indicator carriage having an actuating plunger,
(H) and means connected between said movable jaw and said dial indicator actuating plunger so that relative movement of said movable jaw and said dial indicator carriage operates said dial gauge comprising a spring tube slidably mounted in a hole in said carriage and retained to said carriage with a thumb screw providing easy adjustment with two equal force compression spring retained with an internal snap ring at each end and a U-shaped member attached to said movable jaw and entering the tube through a slot lengthwise in the wall of the tube engaging the near end of each spring to enable force to be transferred without blocking the centermost portion of said tube.

3,273,249
LINEAR GAUGE
William P. Klaassen, Brooklyn, Mich., assignor to Teer Wickwire & Company, Jackson, Mich., a corporation of Michigan
Filed Sept. 22, 1964, Ser. No. 398,250
2 Claims. (Cl. 33—172)

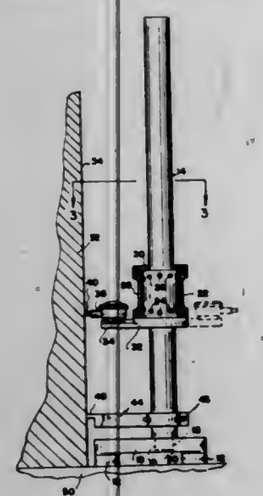
1. A linear gauge for measuring the distance between shaped configurations defined on an elongated article comprising, in combination,
(a) a base,
(b) elongated article holding means mounted on said base, opposed supporting surfaces defined on said holding means defining an elongated groove adapted to support the article to be measured, said supporting surfaces defining the axis of said groove,
(c) a linear elongated track mounted on said base disposed parallel to said groove axis,
(d) a reference block having a reference surface mounted on said article holding means, said surface being transversely disposed to said groove axis and in alignment with said groove whereby an article to be measured disposed within said groove may abut against said surface and be related in a predetermined manner to said article holding means,
(e) a carriage supported on said track for slidable movement thereon in the longitudinal direction of said track, a cylindrical bore defined in said carriage having a vertically disposed axis intersecting the axis of said groove,
(f) an article engaging probe having a cylindrical body surface, a shaped article engaging end defined on one end of said probe having a configuration complementary to the configuration defined on the article to be measured and a handle defined on the other end of said probe, said probe being closely freely slidably received within said cylindrical bore for selective movement of said shaped article engaging end toward and away from said groove axis, and
(g) a direct reading dial indicator mounted upon said carriage, said dial indicator including a rolling drive wheel engaging said track for sensing movement of said carriage on said track, said movement being directly indicated on said dial indicator.

3,273,250
APPARATUS FOR MAKING BOWLING BALLS
Edwin F. Egger, 2519 N. Beach Drive, Seattle, Wash.
Filed July 27, 1961, Ser. No. 127,190
5 Claims. (Cl. 33—174)



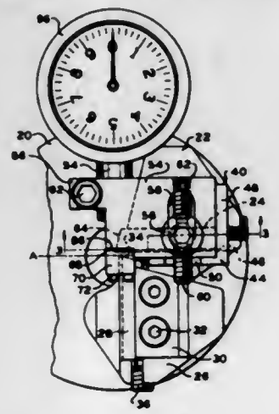
1. A mechanism for determining the position for fingers in a bowling ball, said mechanism having a first stall for receiving a thumb and a second stall for receiving a finger, said first and second stalls being spaced apart, a sleeve in said first stall, said sleeve being capable of moving so as to accommodate the thumb in different positions, a first means comprising a sphere integral with said sleeve, said mechanism having a shell in the configuration of a bowling ball, a plate, said plate being positioned inside of said shell and connected to said shell, a recess in that face of the plate which faces the shell adjacent said stall, said recess receiving said sphere, yieldable means bearing against the sphere and uring the sphere into the recess and against the plate, and means to move the plate with respect to the shell so as to restrict the movement of the sphere and the first sleeve.

3,273,251
DEVICE FOR MEASURING THE UNEVENNESS OF A SURFACE
Floyd S. Saizon, Baton Rouge, La., assignor to American Instruments Corporation, Baton Rouge, La.
Filed Nov. 2, 1964, Ser. No. 408,183
1 Claim. (Cl. 33—174)



A mechanical measuring device for measuring the mean distance between a surface of an object and an opposite reference plane comprising in combination: a stand having a vertically adjustable base for supporting said object with said surface uppermost, and defining said reference plane, and having a top defining a plurality of vertically extending holes; a plurality of probes, each having oppositely disposed ends and an integral flange intermediate said ends, slidably mounted in said plurality of holes with said flanges above said top and adapted not to pass therethrough, said probes for contacting said surface with the lower of said oppositely disposed ends, said probes being displaced vertically by any unevenness of said surface; a plurality of helical springs, having similar coefficients of elasticity, mounted on the up-

per of said oppositely disposed ends of said probes and supported by said flanges; a horizontal member supported by said springs and adapted to freely move vertically, the vertical position of said horizontal member being a measure of the mean pressure of all said springs displaced with said probes by any unevenness of said surface; a horizontally extending indicator mounted on said



horizontal member for indicating said spring supported height thereof; and a scale vertically mounted on said base adjacent said indicator and vertically coordinated with respect to said reference plane and calibrated for the coefficient of elasticity of said springs and numbered to read the mean height of said object as indicated by said indicator.

3,273,252
SQUARENESS INDICATOR
Lothar P. Bunge, 3312 11 Mile Road, Warren, Mich.
Filed Dec. 4, 1964, Ser. No. 416,016
1 Claim. (Cl. 33—174)

A gauge of the type described, comprising: a planar base; a plurality of buttons fixed to one side of said base and having their surfaces which extend away from said base formed in a common plane so as to support said base with respect to a plane surface; a hole formed through the thickness of said base; a cylindrical column having a small diameter neck at one end disposed in said hole so as to support said column normally with respect to the base and said plane surface; a dial indicator support assembly consisting of a tubular ball retainer having a plurality of holes formed therein, an outer sleeve surrounding said retainer, a plurality of balls disposed within said retainer so as to contact the column and the outer sleeve, and a dial indicator support plate fixed to said outer sleeve and having a section extending radially with respect to said column; and a dial indicator fixed to said extending section so that its probe extends radially with respect to said column, the diameter of said column plus the diameter of two of the balls along the diameter of the column exceeds the inner diameter of the sleeve by not more than .002 inch, whereby a press fit is achieved between the sleeve, the balls, and the columns so that said sleeve may be rotated with respect to said column with a relatively small force relative to the force required to move said sleeve along the length of said column.

3,273,253
PRECISION GAGE FOR SETTING CHASERS
Edwin M. Eigenbrode, Waynesboro, Pa., assignor to Landis Machine Company, Waynesboro, Pa., a corporation of Pennsylvania
Filed Jan. 8, 1965, Ser. No. 424,379
6 Claims. (Cl. 33—185)
